## COAL MARKET.—FRIDAY, May 23

Holywell, 18s. 6d.; Eden Main, 14s. 3d.; Cowper's Hartley, 14s. 6d.; West Hartley, 14s. 6d.; Wallsend Biddell, 14s. 6d.; Wallsend Haswell, 15s. 6d.; Wallsend Stewarts, 15s. 6d.; Wallsend Tees, 15s. 6d.—Ships at market, 196.

## POTATOES.—SOUTHWARK, May 19.

The Committee report that during the last week there have been several fresh arrivals coastwise, with an unprecedented large supply by rail. Trade is so very heavy that less prices have again been submitted to. The following are this day's quotations:—York Regents, per ton, 80s. to 90s.; Scotch do., 60s. to 80s.; ditto Cups, 70s. to 80s.; Cathcies and whites, 50s. to 60s.; Cambridge Regents, 45s. to 70s.; Foreign whites, 60s. to 70.

## SMITHFIELD, Monday, May 19.

There was a great falling off in the supply of Beasts, as regards numbers, but the quality was still very good. The trade was much more cheerful than on Monday last, and 3s. 6d. was pretty generally made of choice descriptions. The number of Sheep was smaller, and the demand had considerably increased, consequently an advance of about 2d. per 8 lbs was obtained on most things. The rise was, however more perceptible on large than on small Sheep, the former being very low on Monday last. Lambs and Calves were freely disposed of at rather more money. From Holland and Germany there are 581 Beasts, 1360 Sheep, 178 Calves, and 47 Pigs; from Norfolk and Suffolk, 2000 Beasts; and from Scotland, 500.

| Per st. of 8 lbs.—s d s d | | Per st. of 8 lbs.—s d s d | |
|---|---|---|---|
| Best Scots, Herefords &c. | 3 4 to 3 6 | Best Long-wools | ... |
| Best Short-horns | 3 2 — 3 4 | Ditto Shorn | 3 6 to 3 8 |
| 2d quality Beasts | 2 6 — 3 0 | Ewes & 2d quality | ... |
| Best Downs and Half-breds | ... ... | Ditto Shorn | 2 8 — 3 4 |
| Ditto Shorn | 3 10 — 4 0 | Lambs | 5 0 — 5 6 |
| | | Calves | 3 0 — 4 2 |
| | | Pigs | 2 8 — 3 8 |

Beasts, 3499; Sheep and Lambs, 22,850; Calves, 269; Pigs, 510.

## FRIDAY, May 23.

We have a large supply of Beasts to day and only a small demand; consequently prices have given way, and several remained unsold. Sheep and Lambs are also more plentiful; trade is very dull for them, at a reduction of fully 2d. per 8 lbs. from Monday's quotations. There is a good supply of Calves; they meet with a fair demand at about late rates. From Germany and Holland we have 185 Beasts, 550 Sheep, and 176 Calves; from Scotland, 300 Beasts; from Norfolk and Suffolk, 450; and 114 milch cows from the home counties.

| Best Scots, Herefords, &c. | 3 2 to 3 4 | Best Long-wools | ... |
|---|---|---|---|
| Best Short-horns | 3 0 — 3 2 | Ditto Shorn | 3 4 — 3 6 |
| 2d quality Beasts | 2 4 — 2 10 | Ewes & 2d quality | ... |
| Best Downs and Half-breds | ... ... | Ditto Shorn | 2 8 — 3 2 |
| Ditto Shorn | 3 8 — 3 10 | Lambs | 5 0 — 5 8 |
| | | Calves | 3 0 — 4 2 |
| | | Pigs | 2 8 — 3 8 |

Beasts, 1150; Sheep and Lambs, 10,770; Calves, 406; Pigs, 520.

## MARK LANE.

MONDAY, May 19.—The supply of English Wheat to this morning's market was small, and although fine qualities are much wanted, no improvement upon late rates was obtainable, whilst the secondary were a slow sale on those terms. Foreign was not generally inquired after, and on the business done former prices were insisted upon.—For Barley and Oats the demand was good, and the extreme rates of last week were realised.—Beans must be written 1s. per qr. dearer.—Peas are more inquired after at former prices, having become cheaper than other spring corn.

FRIDAY, May 23.—The arrivals of grain this week, either English or foreign, have been small; this morning's market was thinly attended, and only a retail business was transacted in Wheat; holders, however, insisted on Monday's prices for both English and foreign. Baltic f. o. b. offers find buyers on late terms. Spring corn of all descriptions fully supports our last quotations, Oats in some instances being held for an advance, which is not realised. The Flour trade is quiet, and prices are unaltered. The weather during the past week has been on the whole favourable to vegetation, excepting two cold nights. Great firmness continues to prevail in the country markets, and Wheat in some agricultural districts has further improved in value.

LIVERPOOL, TUESDAY, May 20.—At this day's market there was a fair attendance of the town and country trade, who, however, showed little disposition to enter into business. Wheat met with a slow retail sale, at about the prices of this day week; but Flour was 6d. per sack and 3d. per barrel lower. Oats and Oatmeal, being more plentiful than of late, were rather easier to buy than on Friday, but still 1d. per 45 lbs. and 3d. per load dearer than on this day week. Barley, Beans, and Peas were in moderate request, at full prices. A liberal supply of Indian Corn being expected to arrive in a day or two, buyers acted with great caution, and price s receded 6d. per qr.; 21s. being the top price of American yellow from the quay.—FRIDAY, May 16.—The supplies of grain and Flour continue on a moderate scale. At this morning's market there was little passing in any article of the trade, the buyers, having supplied themselves pretty well last week, are enabled to keep aloof, but no alteration can be made in the general quotations of Tuesday.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND CO. beg to notice their mixtures of GRASS SEEDS for Laying Land down to Permanent Grass, are now ready for delivery. They have reduced the price to 30s. per acre, allowing 2 bushels 12 lbs. to the acre.

Mixed sorts for improving old Grass Land, 1s. 2d. per lb.

Fine sorts, for forming Lawns, 1s. 3d. per lb. Directions for sowing will accompany the Seeds.

GEORGE GIBBS and Co. will feel happy in sending general priced Catalogues of Agricultural and Garden Seeds, on application to 26, DOWN-STREET, Piccadilly, London.

GRASS AND OTHER SEEDS.

THOMAS GIBBS AND CO., the Seedsmen to the "Royal Agricultural Society of England," corner of **Half Moon-street** Piccadilly, beg to call the attention of their friends to the following Seeds:

Mixtures of selected Natural Grasses for laying down Land to permanent Meadows and Pastures, apportioned to suit the nature of the soil.

Mixtures for portions of Parks near Mansions.

Mixtures for Garden Lawns and Grass Plots.

Mixtures for renovating Old Pasture Land.

Italian and other Rye-grasses.

White Belgian and Red Altringham Carrots.

Gibbs' new very large Parsnip.

Orange Globe Mangold Wurzel.

Long Red and other kinds.

Drumhead and Thousand-headed Cabbages.

Swedes, Hybrids, and other Turnips.

Clovers, Kohl Rabi, French and English Furze.

Sainfoin, Rape, Tares, White Mustard, and all Agricultural and Kitchen Garden Seeds, &c.

Priced Lists are now ready, and will be forwarded free, on application, by post, or otherwise, to corner of **Half Moon-street** Piccadilly, London.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

DURABLE OUT-DOOR PAINT.

Removed to No. 9, Great Winchester-street, Old Broad-street, Royal Exchange.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Wood, Iron, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON and SON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange, London.

No Agents.—All orders are particularly requested to be sent direct.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.

PATENT VULCANISED INDIA RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and) Manufacturer, Goswell-road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use; are particularly suitable for Fire Engines, and are found exceedingly useful in dwelling houses for conveying Hot or Cold Water to Baths, &c.

Testimonials and prices may be had on application to the Manufactory.

N.B. Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

All Orders or Letters addressed to J. L. HANCOCK, Goswell-mews, Goswell-road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boats, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

IRON GATES, HURDLES, WIRE WORK, &c.

THOMAS PERRY AND SONS, 252, OXFORD-STREET (NEAR HYDE-PARK), And Lighfield Iron-works, Bilston,

MANUFACTURE all kinds of Park Entrance, Carriage and Field Gates, Wickets, Wrought and Cast Iron Gate Pillars, Plain and Ornamental Fencing, Palisading, and Balconies. Ox, Cattle, Sheep, and other Hurdles.

Tree Guards, Garden Seats, Garden Rollers, Wheelbarrows. Stable Fittings, &c.—Iron Work of every description.

Wire Work in great variety, comprising Gothic and other Fencing, Flower Stands, Trainers, Arches, Pheasantries, &c.

The works being situated in the centre of the Staffordshire Iron district, THOMAS PERRY AND SONS are enabled to execute promptly orders to any extent with the greatest facility, of the best quality, and on the most moderate terms.

Manufacturers of every kind of Solid Iron and Tube BEDSTEADS, with all the recent improvements.

HAYMAKING ECONOMISED.

WEDLAKE AND THOMPSON, Inventors, Improvers, and Manufacturers of the double-cylinder HAY MACHINE (which obtained the prize of the Royal Agricultural Society), beg to call the attention of agriculturists to the above valuable Implement; the motion of which, by a very simple contrivance, is reversed, and turns the hay after being shaken from the swathe, thereby effecting a considerable saving in the expence of manual labour. Horse, Hay, and Corn Rakes, Oat Bruisers, and every description of Agricultural Implements, upon the most improved principle, and at a great reduction in price.—Address: Union Foundry, Hornchurch, Essex.

GLASS. GLASS.

## HARTLEY'S PATENT ROUGH PLATE GLASS, FOR RIDGE AND FURROW ROOFS, GREENHOUSES, RAILWAY STATIONS, ENGINE SHEDS, MILLS, MARKET-HALLS, AND PUBLIC BUILDINGS GENERALLY.

*Packed in boxes of 50 feet each.*

6 by 4 in. and 6½ by 4½ in., 12*s.* per box; 7 by 5 in. and 7⅞ by 5½ in. 13*s.* 6*d.* do.; 8 by 6 in. and 8½ by 6½ in. 15*s.* do.; 9 by 7 in., 9½ by 7½ in., and 10 by 8 in., 16*s.* 6*d.*

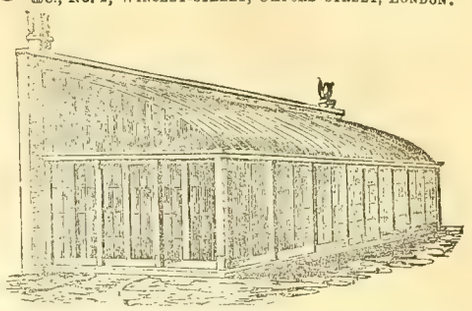
*N.B.—The Patent Rough Plate, one-eighth of an inch thick, is supplied in quantities* 62 *by* 18 *inches, for* 10 *feet span ridge and furrow roofs, at a reduced price.*

NOTE.—Squares are charged according to the superficial contents, except where the length exceeds the restriction above, in which case the higher price is charged irrespective of the contents.

*Bending.*—1-8*th*, 6*d.*; 3-16*ths*, 9*d.*; ¼ *inch*, 1*s. per foot, net.*

*Irregular shapes are charged as squares.*

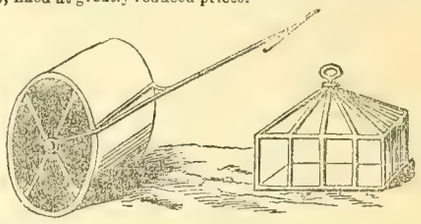
*When Crates are ordered, the* 30*-inch widths will be sent, unless otherwise specified.*



THE PATENT ROUGH PLATE, one-eighth of an inch thick, and weighing 2 lbs. to the foot, has now become an article of very extensive and increasing consumption.

*It is universally admitted to be the best and most suitable Glass for Ridge and Furrow Roofs, Greenhouses, Factories, Workshops,*

And all such like purposes, and is a cheap and efficient substitute for Fluted or Obscured Glass, where the object is to intercept the vision without diminishing the light. Its non-transparency, strength, and cost (being no more weight for weight than Common Sheet Glass), render it eminently suitable for the Glazing of Conservatories and Roofs of all kinds; Blinds are unnecessary, and when used in Greenhouses *no scorching occurs.*



Where still greater strength is required the 3-16ths and ¼ inch thick will be found much cheaper than the Common Rough Plate. Samples will be forwarded on application, by applying to JAMES PHILLIPS & CO, HORTICULTURAL GLASS MERCHANTS, 116, BISHOPSGATE-STREET WITHOUT, LONDON.

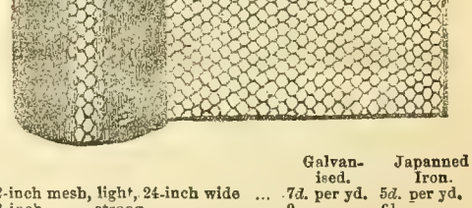
## COTTAM & HALLEN, ENGINEERS, IRON FOUNDERS, &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON.

COTTAM and HALLEN having had long experience in the erection of HOTHOUSES and CONSERVATORIES (made of Iron or of Iron and Wood combined), and from many improvements they have made during that time, can with confidence undertake to erect such buildings with economy and dispatch.

HOT WATER APPARATUS for heating the above and other buildings (of which they have constructed upwards of 3000), fixed at greatly reduced prices.

COTTAM and HALLEN have on show, at their repository, No. 2, Winsley-street, Oxford-street, a great variety of the following articles, for GARDENS, &c., at Greatly REDUCED PRICES, viz :—

| | |
|---|---|
| Garden Rollers | Hand-glass Frames |
| Garden Engines | Flower Stakes |
| Garden Syringes | Flower-bordering |
| Watering Pots | Flower Stands |
| Garden Vases | Garden Arches |
| Mowing Machines | Garden Chairs |



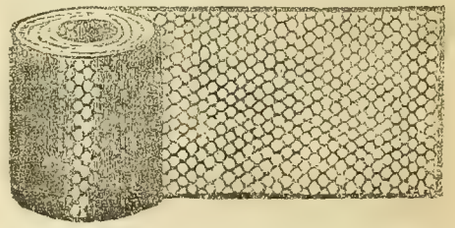
Every description of Work, both Plain and Ornamental, in wrought and cast iron, for Gardens, &c., &c.

HORTICULTURAL TOOLS and AGRICULTURAL IMPLEMENTS of all kinds.

STRONG IRON HURDLES, strained Wire Fencing, &c.

Show Rooms at the MANUFACTORY, 2, Winsley-street, and 76, Oxford-street, three doors West of the Princess's Theatre.

## GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.



| | | Galvanised. | Japanned Iron. |

| 1½-inch ,, strong ,, | ... | 10 ,, | 8 ,, |
| 1½-inch ,, extra strong ,, | ... | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

## WIRE NETTING, ONE PENNY PER SQUARE FOOT.

## GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—

This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

| | | | |

| 12 inches wide | 3*d.* per yard. | 30 inches wide | 7½*d.* per yard. |
| 18 ,, ,, | 4½*d.* ,, | 36 ,, ,, | 9*d.* ,, |
| 14 ,, ,, | 6*d.* ,, | 48 ,, ,, | 1*s.* ,, |

Galvanised do., 1*d.* per foot extra.

Extra-strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, oily-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each. Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

## *SALES BY AUCTION.*

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on TUESDAY, May 27, and THURSDAY, 29th, at 12 o'clock each day, a first-rate collection of DAHLIAS consisting of all the approved kinds and the newest varieties; Fuchsias, Verbenas, Hearts-ease, Climbing and other Roses; a fine assortment of Geraniums and other plants in bloom, together with a quantity of useful and ornamental Plants for bedding. May be viewed the morning of sale; Catalogues had at the Mart, and of the Auctioneers, Leytonstone, Essex.

JAVA ORCHIDS, &c.

MR. J. C. STEVENS has received instructions from Messrs. Rollisson to Sell by Auction, at his Great Room, 38, King-street, Covent-garden, on FRIDAY next, 30th inst., at 12 for 1 o'clock, an importation (just received per ship "Margaret West," direct from Java) of PHALÆNOPSIS GRANDIFLORA, affording an excellent opportunity to Orchid growers of enriching their collections with fine Plants of this most graceful and charming species: also a new Dendrobium, described by the collector, Mr. John Henshall, as being very beautiful. To the Sale will be added 50 Plants of the handsome yellow Rhododendron (Rhododendron Javanicum). —May be viewed on the morning of sale and catalogues had.

FOR PUBLIC SALE, at the New Corn Exchange Tavern, Mark-lane, on MONDAY, June 2, at 2 o'clock precisely, by order of Messrs. Antony Gibbs and Sons, the Importers, 500 Tons, more or less, damaged PERUVIAN GUANO.—Catalogues, and further particulars, in due time, from J. A. RUCKER and BENCRAFT, Brokers, 26, Commercial Sale Rooms.

ORCHIDS.—THE MOST IMPORTANT COLLECTION EVER OFFERED TO PUBLIC SALE.

MR. J. C. STEVENS is favoured with instructions to submit to Auction, at his Great Room 38, King-street, Covent-garden, on MONDAY, June 9th, and following day, a collection of ORCHIDS, that has ranked for some years past as one of the finest in the kingdom; it comprises magnificent Specimen Plants, in perfect health, of all the favourite varieties, an enumeration of a few of the principal of which will suffice to show the high character of the collection.

| | |
|---|---|
| Aerides maculosum | Dendrobium Devonianum |

| ,, albida | ,, Roxburghii |
| ,, aurea | ,, teres, &c. &c. |

Catalogues are preparing, and will be ready 10 days before the sale.

IN SURREY, A GENTLEMAN'S RESIDENCE, with a Farm in high cultivation, comprising over 200 Acres, two miles from a first-class Station on the South Western Railway, and within an hour of the City, or Westminster.

TO BE DISPOSED OF, on Lease, a VERY COMPACT FARM, for five years past under most liberal cultivation and improvements, with a good family HOUSE, situated on a delightful and healthy elevation, and in complete repair; containing a handsome drawing-room, a library, a dining-room, and gentleman's room, 10 bed-chambers, and suitable offices; coach-houses, excellent stabling and loose boxes (two packs of hounds in the neighbourhood, and the right of shooting is with the tenant), two entrance lodges, pleasure-grounds, garden and orchard, and large newly erected barn and other modern and admirably arranged farm buildings, sheltering three stock yards, with manure tanks, and every requisite for the profitable and enjoyable occupation of the land.—For particulars apply to Mr. JOHN DAWSON, Auctioneer and Land-agent, Marlborough Chambers, 49, Pall-mall, and Kingston, Surrey.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of rearing for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

TO BE DISPOSED OF, with immediate possession, or in Autumn, an old Established NURSERY and FRUIT GROUND, the proprietor retiring from business. It is situated in a populous neighbourhood, six miles from London; the ground is unrivalled for Trees and Shrubs, also for producing the finest Fruit.—For particulars apply to J. C. HARDY, Esq., National Guardian Assurance Society, 19, Moorgate-street, London.

TO BE SOLD OR LET ON LEASE FOR 90 YEARS OR LESS, TO GENTLEMEN'S GARDENERS DESIROUS OF ENTERING INTO BUSINESS, NURSERYMEN OR FLORISTS.

TO BE SOLD OR LET, immediately, at Michaelmas, or within 12 months from this date, a very compact Horticultural Establishment, consisting of about 12,000 feet of glass erections, nearly new, having all been erected since 1843. The whole of the Pits and Houses are heated by hot water; there is an excellent Dwelling-house on the Premises, in good repair, consisting of 12 rooms, which are so arranged as to accommodate two families, if required. The construction of the houses and situation is very desirable for persons wishing to cultivate Plants for market, or attending to the business of looking after small gardens, being situated on the main road from London to Brentford, and within four miles of Piccadilly. A Lease for 90 years can be granted by the present proprietor, if required, whose great increase of professional business from home is the only cause of this desirable property being disposed of. This offers an excellent opportunity for two persons wishing to enter into the Nursery business.—For further particulars apply to A. Z., at the Office of this Paper.

NURSERIES, MERRIOTT, NEAR CREWKERNE.

TO BE DISPOSED OF, the above old-established NURSERIES, on reasonable Terms, in consequence of the Proprietor's engagements in another business which requires his whole attention. There would be no objection to accept security for a part of the purchase money, if desired.—Apply to Mr. W. WEBBER Nurseries, Merriott, near Crewkerne.

DESTRUCTION OF BLIGHT.

PAGE AND CO., SEED MERCHANTS, &c., 37 and 38, Oxford-street, Southampton, have to offer their COMPOSITION for the destruction of those INSECTS which are so severely attacking the Roses, Wall-Fruit Trees, Greenhouse Plants, &c., at 1*s.* 9*d.* per gallon (jars extra). It is particularly recommended to the Amateur and the practical Gardener, as a speedy and effectual remedy.

Agents: Messrs. Butt and Co., Strand, London; Mr. Wilson, Nurseryman, Wimborne, Dorset; Mr. Moore, Seedsman, Cowes, Isle of Wight; Mr. Whitmore, Nurseryman, Newport, Isle of Wight.

Turnip Seeds, of the most approved sorts, at the lowest market prices.—Plants, for the decoration of the Flower Garden, 25*s.*, 30*s.*, and 40*s.* per 100, very strong.

DO YOU BRUISE YOUR OATS?

HORSE KEEP.—Oat Bruisers, Chaff Cutters, Ploughs, 42*s.*, Shares, 5*s.* per dozen; Rollers, Wheat Mills, Bean Mills, Steam Engines, Scarifiers, Turnip Cutters, Dressing Machines, Drills, Threshing Machines, Wood and Iron Harrows, Steaming Apparatus, Scotch Carts, Hay-making Machines, Horse Hay Rakes, and Drag Mills. First class goods warranted. MARY WEDLAKE and Co., 118, Fenchurch-street. Most liberal discount for cash. Goods delivered free. On receiving six postage-stamps a list, with 107 engravings, will be sent free.

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—The Public is respectfully informed, that these favourite Ales may be had genuine, in casks of 18 gallons and upwards, at their respective stores, as under where also a list of the bottles may be obtained.

The Brewery, Burton-on-Trent; Stores, 61, King-William-street, City, London; Cook-street, Liverpool; High-street, Birmingham. The Exchange, Manchester, 33, Virginia-street, Glasgow.

*On the 31st inst. will be published, price One Shilling, with a Coloured Engraving and numerous Woodcuts by* JOHN LEECH,

DEVONSHIRE HOUSE.

THE SECOND REPRESENTATION, by the Amateur Company of the GUILD OF LITERATURE AND ART, under the direction of Mr. CHARLES DICKENS, of SIR EDWARD BULWER LYTTON'S NEW COMEDY, In Five Acts, entitled

NOT SO BAD AS WE SEEM;

OR, MANY SIDES TO A CHARACTER.

With (First time) an Original Farce, in One Act, called

MR. NIGHTINGALE'S DIARY,

Will take place in Devonshire House, on TUESDAY, the 27th of May. Applications for Vouchers for the Tickets, price Two Pounds each, to be made to Mr. MITCHELL, 33, Old Bond-street, who will refer the same to the DUKE OF DEVONSHIRE.

There will take place, on the same Evening, a BALL, in the Great Saloon of Devonshire House, which, it is hoped, will be agreeable to those purchasers of Tickets who, from the limited space in the Theatre, may not be able to procure convenient seats for the performance.

WILLIAM HENRY WILLS, Hon. Sec.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

---

Recently published, in 1 vol. 8vo, price 9s.,

THE SABBATH; or, an Examination of the Six Texts commonly adduced from the New Testament, in Proof of a Christian Sabbath. By a LAYMAN.

Also, by the same Author, 8vo, price 1s.,

THE MOSAIC SABBATH; or an Inquiry into the Supposed Present Obligation of the Sabbath of the Fourth Commandment.

The Author's object in the two works above mentioned is not to discountenance the religious observances of the Sunday. It is to show that this salutary institution is of human and not directly of divine origin; consequently that it cannot be a sin against God to do work on that day, and that the attempt of the over-righteous among us to put down all work whatever, however useful, on the Sunday, is, on any religious grounds, wholly unjustifiable.

OPINIONS OF THE PRESS ON "THE SABBATH."

"A very able disquisition on this subject."—*Westminster Review* for October 1850.

"A very elaborate controversial, critical, and minute examination of the Six Texts which are supposed to justify Sunday observance.

"This is a calmly-reasoned, well-written work, composed in a spirit worthy of the solemn theme it treats."—*Economist* of June 29, 1850.

OPINIONS OF THE PRESS ON "THE MOSAIC SABBATH."

"An able pamphlet, well deserving public attention."—*Westminster Review* for October, 1850.

"Here is a little treatise of 50 pages, which completely and for ever settles the whole question, and which has all the rigorous demonstration that the question admits. We cordially commend this treatise."—*The Leader* of September 14, 1850.

London: CHAPMAN and HALL, 193, Piccadilly.

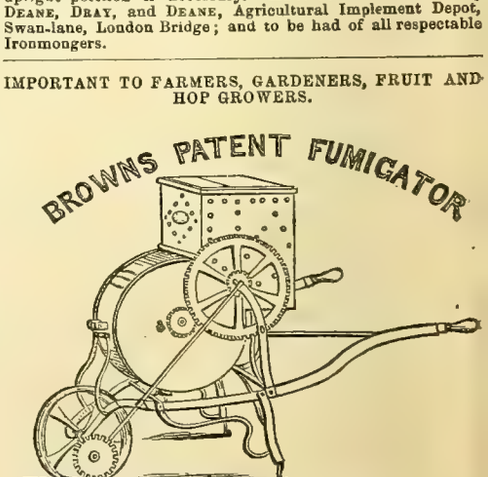
BOYD'S SELF-ADJUSTING SCYTHE



(CLASS IX. OF THE EXHIBITION),

Can be put together and regulated to any angle by any person in one minute, without the assistance of a blacksmith; shuts up like a knife, and can be carried without danger. It effects a saving of 25 per cent. in labour, and can be used in an upright position if necessary. Manufactured and sold by DEANE, DRAY, and DEANE, Agricultural Implement Depot, Swan-lane, London Bridge; and to be had of all respectable Ironmongers.

---

IMPORTANT TO FARMERS, GARDENERS, FRUIT AND HOP GROWERS.

"The skilful farmer, chaff
And blazing straw before his orchard burns
Till all, involved in smoke, the latent foe
From every cranny suffocated falls."

THOMSON'S SEASONS.

BY means of this instrument, the smoke produced by burning refuse vegetables can be directed in a cool state upon Agricultural Drilled Crops, or upon Wall or Standard Fruit Trees, Hops, &c., and blight or insects destroyed. It is also available for filling large houses with Smoke of Tobacco or other material; disinfecting impure places in ships and buildings; and for eradicating vermin. The machine may be obtained with or without the drilling apparatus.

Manufactured by Messrs. DEANE, DRAY, and DEANE, Swan-lane, London.

The Lady Frankland Russell
The Lady Boynton
Mrs. Prickett
Mrs. Boynton
Mrs. Barnes
Mrs. Creyke, Rawcliffe Hall

With others in course of addition.

The object of this Institution is to encourage and promote the Cultivation of Fruits, Flowers, and Vegetables, and to improve the practice of Floriculture and Horticulture in general; and is proposed to follow the Yorkshire Agricultural Society in its Meetings, and not only thus secure a large and influential attendance, but also give additional interest to the Meetings of that valuable Society itself, which has specially approved of the formation of this.

The Society's Exhibition in this, its First Year, will be held near to BURLINGTON AND THE QUAY, on TUESDAY and WEDNESDAY, the 5th and 6th days of August next; and in addition to the Prizes usually offered for Flowers, Fruits, and Vegetables, the Society has determined to offer Prizes for a GARDEN DESIGN, accompanied with a short Essay and Monthly Calendar of Operations on the general cultivation thereof; also, Prizes for Wirework, Tools, and Materials for Protecting Trees from Frost, Birds, and Insects.

Particulars and Prize Sheets can be had on application to the SECRETARY, at Thirsk, to whom also the Names of Members or Subscribers should be sent.

The Society has adopted the following Rule (subject to the Transfer regulation):—"That Members and Subscribers of 5*s*. and upwards be entitled to exhibit free of any charge; and that Subscribers of from 5*s*. to 10*s*. be entitled to One Ticket of Admission; 15*s*., Two; and 1*l*. and upwards, Three."

And it has also been determined to devote the surplus of any proceeds it may have to the charitable institutions of the locality where the Exhibition is held. By order,

Thirsk, May 31. ROBERT HICK, Secretary.

"THE FLOWER OF THE DAY" may now be seen in bloom at J. AND C. LEE'S NURSERY, HAMMERSMITH. Price, per dozen, according to size, on application.

AZALEA INDICA "SYMMETRY" (KINGHORN), will be sent out on 1st June, price 21*s*. Discount to the trade.

FUCHSIA "CLAPTON HERO" (BATTEN). Ditto "PAGODA" (BATTEN).—These can with confidence be recommended as the best of the dark varieties of this season; price 7*s*. 6*d*. each.

POTENTILLA LUCIA; OR, BICOLOR GRANDIFLORA.—Colour, sulphur yellow, edged with scarlet; vigorous grower, and produces the largest flowers of any known variety; 5*s*. each.

POTENTILLA ANTWERPIENSIS.—Colour, dark brilliant orange, dwarf growth, producing semi-double flowers in great profusion, which do not close at night; 7*s*. 6*d*. each.

SWEET ORANGES, 18 inches to 2 feet, in Fruit; 10*s*. each.

Also all the new English and Continental Verbenas, Fuchsias, Liliputian Chrysanthemums, German Daisies, &c. For particulars of which we refer to our general Catalogue just published, which can be had by post, free, on application.

HUGH LOW and Co., Clapton Nursery, London.

CALIFORNIAN FLOWER SEEDS.—The undersigned having received a collection of CALIFORNIAN SEEDS, chiefly Perennials, among which some striking novelties may be anticipated, he offers them at the following prices, in small packets, prepaid:—

The entire collection of 30 packets ... 18*s*.
Half of ditto, or 15 ditto ... ... ... 9*s*.
A selection of 10 sorts ... ... ... 7*s*. 6*d*.

Referring to his advertisement in the *Gardeners' Chronicle* of the 3d and 10th inst., he begs to suggest, that the flower seeds may still be sown with advantage during the next fortnight. Of the hardy Annuals, he recommends half to be sown now, and the other half in the autumn, for early flowers next year. The cold, backward springs of late, render such precaution necessary. Perennials and Greenhouse Seeds may be sown till July.

JAMES CARTER, Seedsman and Florist, 238, High Holborn, London.

THE VICTORIA REGIA IS NOW FLOWERING, GROWING IN THE OPEN AIR, AT

J. WEEKS AND CO'S., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers.

NOTICE.—AMERICAN PLANTS.

GEORGE BAKER begs to announce that his extensive collection of AMERICAN PLANTS will be in bloom on and after the 30th May, and may be seen gratis. The Nursery is situated seven miles from Staines Station, South-Western Railway, and three miles from Virginia Water, where conveyances may always be obtained.

G. B. takes this opportunity of informing the Nobility, Gentry, and Public that he is a Contributor to the American Exhibition, Royal Botanic Garden, Regent's Park.

Windlesham Nursery, Bagshot, Surrey, May 27.

NOTICE.—EXHIBITION OF AMERICAN PLANTS, KNAP-HILL NURSERY, NEAR WOKING, SURREY.—The American Plants, at this Nursery, are now in bloom, and may be seen daily (gratis), Sundays excepted. The Knap-hill Nursery is within one hour's ride of London, being near the Woking Station, South-Western Railway, where nearly every train stops, and from whence conveyances may at all times be obtained.

HOSEA WATERER takes this opportunity of stating that the Exhibition of American Plants in the Horticultural Society's Garden, Chiswick, is entirely supplied from his Nursery, and that he is *not* this year a contributor to that in the Botanic Gardens, Regent's-park.—Knap-hill, Woking, Surrey, May 31.

THE AMERICAN NURSERY, BAGSHOT, SURREY.

JOHN WATERER begs to announce that his splendid Collection (containing many thousand specimens) of RHODODENDRONS, AZALEAS, &c., is now in full bloom, and may be seen daily, gratis, Sundays excepted.

The Nursery is situated three miles from the Blackwater Station, South-Eastern Railway, and near the Farnborough Station, South-Western Railway.—Conveyances are always to be obtained at either Station.

He also begs to state, that he is the principal contributor to the great American Plant Exhibition, now on view at the Botanic Gardens, Regent's Park.

STORY'S SUPERB SEEDLING FUCHSIAS.—FUCHSIA PRINCE ARTHUR (STORY'S).—This is the finest of all the double corolla flowers yet raised and offered by Mr. Story. The corolla is of intense purple and well formed; the tube and sepals are a fine scarlet, smooth and without excrescence, the sepals being sufficiently reflexed to show the corolla to advantage. It is a free bloomer, of good habit, and a great novelty. Strong plants, 10*s*. 6*d*.

FUCHSIA ATTRACTION (STORY'S).—This is a very attractive flower, of extra large size and brilliant colours. The tube and sepals are vermilion, the corolla a fine purple, and rendered very conspicuous by the sepals reflexing. A free-flowering and saleable variety. Strong plants, 7*s*. 6*d*.

FUCHSIA DEVONIENSIS (STORY'S).—This is a fine variety of excellent habit, with a short scarlet tube, and sepals of fine texture; corolla beautiful, light violet, and well formed. It is an abundant bloomer, and will be an acquisition to every collection. Strong plants, 7*s*. 6*d*.

The set of three, taken together, package included, for 21*s*., for cash (prepayment). The usual discount to the Trade.

Messrs. VEITCH and SON have much pleasure in offering the above beautiful Fuchsias. They are seedlings raised in 1849, and proved in 1850 by W. H. Story, Esq., of Whitehill, Newton Bushell, and were selected from a vast number of seedlings. They are all perfectly distinct, and worthy of general cultivation. Mr. Story's well-known character as a raiser of seedlings will be a sufficient guarantee that he would permit nothing to be sent out, with his name attached, that was not of first-rate character, and calculated to give satisfaction.

N.B.—A remittance or reference from unknown correspondents required; this will be strictly adhered to.

Exeter, May 31.

ROSE NURSERIES, HERTFORD.

E. P. FRANCIS offers the following Stock of Bedding-out Plants, strong and vigorous, in 60-size pots, and which will be sent to any part of the kingdom, carriage paid to London:

SCARLET GERANIUMS, Tom Thumbs, &c., 4*s*. per doz., strong.
VERBENAS, all the best varieties in cultivation, 3*s*. per doz.
PETUNIAS, Splendens, Beauty, and Fielderi, 4*s*. per doz.
FUCHSIAS, all the best leading varieties, 4*s*. per doz.
HELIOTROPES, including the new varieties, 3*s*. per doz.
PENTSTEMONS, fine varieties, 4*s*. per doz.
AGERATUM CŒLESTINUM, 3*s*. per doz.
CALCEOLARIAS, Viscosissima and other varieties, 3*s*. per doz.
ANAGALLIS, blue and red, 4*s*. per doz.
NIEREMBERGIAS, 4*s*. per doz.
CUPHEA PLATYCENTRA, 3*s*. per doz.
GAILLARDIA PICTA, &c., 3*s*. per doz.—May 31.

"BERBERIS DARWINII."

(Beautiful Hardy Evergreen Shrub, from the Snow Line on the Andes of Patagonia.)

MESSRS. VEITCH AND SON feel the greatest confidence in offering for sale the above valuable BERBERIS, a plant and also a cut specimen of which were exhibited at the Horticultural Society's Rooms in Regent-street, the 1st of April last, and received the "*Large Silver Medal.*" They beg to refer to Dr. Lindley's report in the *Gardeners' Chronicle* of April 5th, as follows:—

"This proves to be a species whose importance it is almost impossible to overrate, inasmuch as it is exceedingly handsome, perfectly hardy, and naturally produces its rich orange blossoms in great profusion during the early months of the year. Indeed, for general value, we have nothing at present at all to be compared with this fine Berberry."

Strong plants will be ready for sending out on and after the 12th of June next, at 21*s*. each, with the usual allowance to the trade.—Exeter, May 31.

DAHLIAS.

JOHN KEYNES, FLORIST, Salisbury, is now prepared with extra strong plants of the following New and First class DAHLIAS:—

| | |
|---|---|
| Yellow Superb | Baltic |
| Hon. Mr Herbert | Antoinette |
| Beauty of Kent | Miss Pope |
| Summit of Perfection | One-in-the-Ring |
| Nepaulese Chief | Miss Herbert |

The whole stock of these are in the possession of JOHN KEYNES, and Prizes for the best Six Blooms from the above will be given at three of the leading Exhibitions of the season. Orders for Dahlias from other growers faithfully executed in conjunction with his own.—Salisbury, May 31.

VICTORIA REGIA, and other AQUATICS.—JOSEPH KNIGHT and THOMAS A. PERRY avail themselves of this excellent medium to acquaint their distinguished patrons that they have, at an outlay of little less than 500*l*., erected a house for these much-admired plants (for an interior view of which see page 535 of the work called "London and its Vicinity Exhibited in 1851," published by Weale), and that they are not only able to show the following and other beautiful kinds, growing in great luxuriance, to those who will condescend to honour their establishment with their visits (which are most respectfully solicited), but are also able to supply them in healthy young plants, and at reasonable prices.

VICTORIA REGIA.
NYMPHÆA RUBRA.—The flowers of this superb species are an intense carmine in colour.
" SANGUINEA.
" DENTATA.—This magnificent Sierra Leone species bears flowers nearly a foot wide.
" CÆRULEA.
" STELLATA.—A beautiful and rather small tropical kind, which would flower in a china vase.
" LOTUS.
" MEXICANA.
" ESCULENTA.
" PYGMÆA.—This tiny water-lily may be flowered in the smallest vase, and would, with little attention, delight in a lady's boudoir.
" CYANA.
" MICRANTHA.

| | |
|---|---|
| NELUMBIUM SPECIOSUM | NELUMBIUM ALBUM. |
| " LUTEUM. | " FLORE PLENO. |

Those who saw the grandeur of these noble oriental plants, in our small aquarium, last year, will remember them as among the most beautiful things ever introduced into this country.

THALIA DEALBATA.—This is a very graceful plant, and flowers freely.
CALADIUM ESCULENTUM.—The leaves of this gigantic plant sometimes measure 4 feet in length, and 3 in width, and have the appearance of large shields.

| | |
|---|---|
| CALADIUM BICOLOR. | CALADIUM PICTUM. |
| " ATROPURPUREUM. | " PUNCTATUM. |

CYPERUS FLABELLIFORMIS.
" ALTERNIFOLIUS.
PAPYRUS ANTIQUORUM.
CERATOPTERIS THALICTROIDES.—This is the interesting water Fern.
PISTIS STRATIOTA.
PONTEDERA CRASSIPES.

With numerous others, of great interest and beauty.

KNIGHT and PERRY feel that they are perhaps outstepping their province, yet they cannot refrain from suggesting, that an aquarium, or residence for water plants, may be made a most agreeable and elegant appendage to the mansion; for, if designed and executed with taste and judgment, it might combine not only a fit abode for Ferns, Eastern Orchids, and low growing Palms, but also the comfort and healthfulness of a tepid bath, the luxury of which, amid tropical vegetation, disarmed of tropical dangers, may be more easily imagined than described.

The convenience of their Brooklands Nursery enables them to grow an excellent collection of hardy water plants, of which they would most respectfully solicit an inspection.

Exotic Nursery, King's Road, Chelsea, May 31.

JAMES TURRELL has to offer the finest and best New Scarlet GERANIUMS in cultivation.

FIRE KING.—Intensely vivid scarlet, very clear white eye, fine habit, and free bloomer (*individual* flowers, 1½ inch in diameter). Price 7*s.* 6*d.*, strong.

WARNEFORD PET.—Bright scarlet, with white centre; good shape. This variety is most valuable for bedding, as it is more dwarf than compactum, and a good bouquet flower. Price 5*s.*, strong.

NEW FANCY PELARGONIUM, "STRIATA COCCINEA."—Beautiful dark mulberry upper petals, the lower strikingly veined, and of the same colour. Price 10*s.* 6*d.*

Strong Bedding Plants, of sorts, 4*s.* per dozen; Crusader and Mount Etna, 1*s.* each. The Trade liberally treated.

Providence Nursery, Ramsgate.

---

NEW DAHLIAS; E. FOSTER'S, ESQ., CHOICE PELARGONIUMS; PICOTEES, CARNATIONS, HOLLYHOCKS, PANSIES, &c.

WILLIAM BRAGG, Star Nursery, Slough, begs to say his Catalogue of the above Flowers is now ready, and can be had on application. His choice SEEDLING DAHLIAS will be sent out the first week in May at 10*s.* 6*d.* each, viz.:—

ADMIRAL, rich lilac, very constant, gained first Seedling prize, 25*s.*, at the Royal South London Exhibition; 21*s.* Shacklewell Open Shows, &c., fourteen first class certificates; the most successful flower of the year.

CARMINA, rich carmine, constant show flower, gained six first class certificates, &c., shown in several winning stands.

The Hon. MRS. ASHLEY, waxy white, tipped with rose, splendid show flower, &c. W. B. thinks it the best Dahlia of the season; was awarded by Dr. LINDLEY a certificate of merit at the Horticultural Society, &c. Gained five first class certificates.

QUEEN OF FAIRIES, Domeyer. W. BRAGG has purchased the stock of this fine and constant fancy Dahlia, from the above amateur, who will give 5*l.* in prizes the next season for this flower. It gained a Seedling prize and first class certificate, with Edwards's Mrs. HANSARD; at the Royal South London Open Show Exhibition five first class certificates.

W. B.'s stock of Picotees, Carnations, and Pinks are strong and good; the best Hollyhock Seed ever sent out can be had in 2*s.* 6*d.* and 5*s.* packets, post paid, for prepayment.

---

MEDINILLA MAGNIFICA.

MESSRS. VEITCH AND SON have much pleasure in offering this splendid and unique Stove Plant, with pendulous bunches of flowers 12 to 18 inches in length, having beautiful large rose-coloured bracteas.

It was exhibited at the Horticultural Society's Room, Regent-street, on the 2d of April, 1850, and was awarded the "*Large Silver Medal.*" For description, see *Gardeners' Chronicle*, April 6th, 1850.

It was again exhibited at Chiswick, on Saturday last, May 3d, where it received the "*Certificate of Excellence.*"

It is figured in Curtis's "Botanical Magazine" for September, 1850.

It has been so much admired by all who have seen it, and is altogether so first-rate a plant, that Messrs. VEITCH and SON can recommend it with the most perfect confidence.

Strong plants will be ready for delivery on and after the 12th of June next, at 63*s.* each, with the usual allowance to the trade; and, when six plants are taken, an additional one will be put over.—Exeter, May 31.

---

TULIPS—SPLENDID OPPORTUNITY.—FOR SALE, by subscription, at 3*s.* every variety, indistinctly, of the celebrated collection of M. TRIPET, of Paris, containing 1360 different specimens, admitted to the Great Exhibition, visited by Napoleon in 1805, awarded 3 gold medals in France and Belgium. This collection is 100 years old, more than 300 varieties of which are unique. Chance alone will allot the different demands, which must be chosen according to their respective numbers in the Catalogue. Delivered with their names, and thoroughly warranted. Varieties are sold, from 12 in number. To be seen in full blossom, opposite the Exhibition.—Apply, post-paid, to Mr. FORNEY, Bute-street, Old Brompton, near London.

---

FERNS.—The present prevailing taste for this interesting and elegant tribe of plants, has induced the Subscribers to offer them in selections as under:—12 distinct exotic species, 30*s.* to 60*s.*; 25 ditto, 50*s.* to 100*s.*; 20 distinct hardy species, 1*s.* to 1*s.* 6*d.* each. Selection of sorts left to H L. and Co. It would be advisable to state if they are required for Wardian cases, as small growing sorts would then be selected.—HUGH LOW and Co., Clapton Nursery, London.

---

CATTLE DRUMHEADS (fine), warranted true, by THOMAS WELLAND, Surrey Gardens, near Godalming, Surrey.—Delivered at Godalming Station, 3*s.* 6*d.* per 1000, crates included. Cauliflowers 2*s.* 6*d.* per 100.

---

CHOICE PLANTS.

J. FOWLE AND SON are now prepared to send out Smith's new collection of VERBENAS, the set of 12, well rooted, for 1*l.* 5*s.*; Dielytra spectabilis, 15*s.* per doz.; Fuchsia serratifolia floribundissima, 5*s.* each; Choice do., of last season, 9*s.* per doz.; Antirrhinums, 6*s.* and 9*s.* per doz.; Calceolaria, Kentish Hero, 9*s.* per doz.; Choice Bedding-out Plants, in great variety, 4*s.* per doz. Catalogues may be had on application. Post-office orders made payable at Kennington Cross.

Holland Nursery, Brixton Road, Kennington, Surrey.

---

GRASS AND OTHER SEEDS.

THOMAS GIBBS AND Co., the Seedsmen to the "Royal Agricultural Society of England," corner of **Half Moon-street** Piccadilly, beg to call the attention of their friends to the following Seeds:

Mixtures of selected Natural Grasses for laying down Land to permanent Meadows and Pastures, apportioned to suit the nature of the soil.

Mixtures for portions of Parks near Mansions.
Mixtures for Garden Lawns and Grass Plots.
Mixtures for renovating Old Pasture Land.
Italian and other Rye-grasses.
White Belgian and Red Altringham Carrots.
Gibbs' new very large Parsnip.
Orange Globe Mangold Wurzel.
Long Red and other kinds.
Drumhead and Thousand-headed Cabbages.
Swedes, Hybrids, and other Turnips.
Clovers, Kohl Rabi, French and English Furze.
Sainfoin, Rape, Tares, White Mustard, and all Agricultural and Kitchen Garden Seeds, &c.

Priced Lists are now ready, and will be forwarded free, on application, by post, or otherwise, to corner of **Half Moon-street** Piccadilly, London.

---

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND CO. beg to notice their mixtures of GRASS SEEDS for Laying Land down to Permanent Grass, are now ready for delivery. They have reduced the price to 30*s.* per acre, allowing 2 bushels 12 lbs. to the acre.

Mixed sorts for improving old Grass Land, 1*s.* 2*d.* per lb.

Fine sorts, for forming Lawns, 1*s.* 3*d.* per lb. Directions for sowing will accompany the Seeds.

GEORGE GIBBS and Co. will feel happy in sending general priced Catalogues of Agricultural and Garden Seeds, on application to 26, **DOWN-STREET, Piccadilly, London.**

---

SKIRVING'S IMPROVED TURNIP SEEDS.

WM. SKIRVING begs to announce to his friends and the public, that he has fixed the price of his IMPROVED SWEDE, and also the PURPLE-TOP YELLOW-BULLOCK, at 9*d.* per lb.

In consequence of W. S. having extended the growth, and having had a very abundant crop of the Seed of his Improved Turnips, he is this season able to offer it at the above reduced price, and he is also induced to take this step to prevent Agriculturists being imposed upon by the sale of spurious Seeds, offered at a low rate, under his name.

W. S. can, with perfect confidence, recommend these Turnips as being the best now in cultivation, in every respect, whether for the greatest crop, the best quality, or for keeping, according to the time of sowing. All other Agricultural Seeds, of the best quality, at very moderate prices. A remittance, or reference, is requested from unknown correspondents.

N.B. W. SKIRVING has no Agent in town or country.

Queen-square, Liverpool, May 31.

---

SCARLET RUNNER BEANS.

TO BE SOLD, a few Bushels of SCARLET RUNNERS, at 25*s.* per bushel.—Apply to Mr. HENRY CLARKE, Seed Merchant, 39, King-street, Covent Garden, London.

---

---

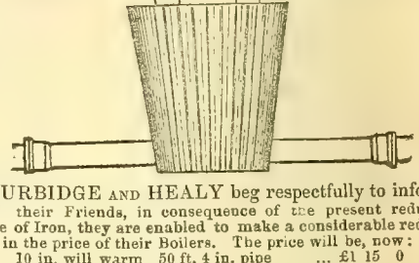
TO NURSERYMEN, FLORISTS, &c.

BETHAM AND BLACKITH, Custom House, Insurance and General Forwarding Agents, Cox and Hammond's Quays, Lower Thames Street, beg to return thanks to their Continental and Home friends for the numerous favours they have so long and largely enjoyed, and to assure them that they continue to receive and forward goods to all parts of the world at the *lowest possible* charges, consistently with responsibility, safety, and dispatch.

---

BOYD'S SELF-ADJUSTING SCYTHE

(CLASS IX. OF THE EXHIBITION),



Can be put together and regulated to any angle by any person in one minute, without the assistance of a blacksmith; shuts up like a knife, and can be carried without danger. It effects a saving of 25 per cent. in labour, and can be used in an upright position if necessary. Manufactured and sold by DEANE, DRAY, and DEANE, Agricultural Implement Depot, Swan-lane, London Bridge; and to be had of all respectable Ironmongers.

---

ANTHONY'S PATENT AMERICAN CHURN obtained the following prizes:—At Exeter Agricultural Meeting, Silver Medal; at the Highland Society's Cattle Show, held at Glasgow, the two First Prizes, one for Hand-Churn, and one for Power; at Thirsk, the First Prize; and at the Royal Northern Society's Cattle Show, the First Prize; and it now stands unrivalled. Since its introduction, last year, upwards of 2000 have been sold, and numerous testimonials in its favour received, copies of which, with list of prices, will be forwarded, on application to Messrs. BURGESS & KEY, 103, Newgate-street.

---

REDUCTION IN PRICE OF BOILERS.

Larger Squares increase in price according to size. Every size kept ready packed in boxes, and may be had at a moment's notice.

Extra Crown, Sheet, and Patent Rough Plate Glass, cut to size for Conservatories, Greenhouses, &c.

Gardeners and others glazing on Mr. Paxton's plan can be supplied with Sash-bars of any length for the purpose.

PROPAGATING, CUCUMBERS, FERN, PEACH, and every description of Garden Glasses.

Bailiffs, Farmers, Dairymen, and others supplied with Lord Camoy's Milk Syphons, Milk Lactometers, Glass Milk Pans, Glass Tiles, Slates, &c., &c., for collections of which Messrs. COGAN and Co. were honoured with the Silver Medal of the Dublin Society, as also the Silver Medal of the Liverpool and Manchester Society held at Warrington in September last.

For Estimates, Prices, and further particulars, please address Messrs. COGAN and Co., 48, Leicester-square, London.

Glass Shades, Gas Glasses, White Lead, Colours, &c., as usual.

NEW HARDY JAPAN PLANT.
DEUTZIA GRACILIS (true.)

JOSEPH BAUMANN, Nurseryman, Ghent, Belgium, having a good stock of the above beautiful and distinct DEUTZIA, will send it out on the 1st of August.

| | | | |
|---|---|---|---|
| Extra strong well established plants | ... | ...£1 | 0 0 |
| Smaller do. do. | ... | ... | 0 12 6 |
| Grafted, 4 to 5 feet high | ... | ... | 2 0 0 |

J. B.'s Deutzia gracilis will never grow higher than 2 feet. Messrs. Hugh Low and Co., of Clapton, have seen it in bloom, and have ordered 40 plants of it.

This plant may be had in bloom six months in the year.

J. B. has received the following prizes for this plant. 1850, Ghent first prize; 1851, Chiswick, May the 3d, prize of excellence; Regent's Park, May 14th, first prize. Bruxelles first prize, Antwerp first prize, Mechlin first prize, Louvain first prize, Mentz first prize, Erfurt first prize, Paris first prize.

One over to the Trade on three. No discount if less than three plants are ordered. Free to London.

Deutzia crenata vera, new (D. gracilis of some), 1s.

EDWARD GEORGE HENDERSON is now prepared to forward his new SPRING CATALOGUE for 1851, post free on application, and it will be found to contain all the new Stove and Greenhouse Plants, new Geraniums, Fuchsias, Cinerarias, Verbenas, Chrysanthemums, soft-wooded and other Plants, sent out in this country or on the Continent. Much pains have been taken to render the descriptions full and correct, so as to make it a guide to purchasers.

E. G. H. also solicits attention to the new Plants he is now sending out, as will be seen on referring to page 64 of the Catalogue.

Wellington-road Nursery, St. John's Wood, London, May 31.

SELECT BEDDING PLANTS.

BASS AND BROWN have a large and fine Stock of the following, well established, and now sending out; they are mostly in small pots, so as to be packed in a little compass. Those marked * can be sent free by post, if required.

SCARLET GERANIUMS, in variety, strong, 6s. and 9s. per dozen.

* VERBENAS, a large collection of the best sorts for forming dwarf beds, such as Apollon, Anacreon, Defiance, Emma, Eclipse, Eyebright, Junon, Princess Alice, Psyche, Rosati, Vulcan, White Perfection, and others, 4s. per dozen.

* PETUNIAS, a large collection of bright purple and crimson flowers, 5s. per dozen.

* FUCHSIAS, a large collection of select varieties, 5s. p. doz.

DAHLIAS, the best varieties, both show and fancy, 5s., 9s., and 12s. per dozen.

Heliotropes of sorts, 4s. to 6s.; Bouvardias of sorts, 9s.; Lantana crocea, 6s.; Lobelia maxima, erinus, &c., 4s.; Blue Anagallis, 6s.; Cupheas of sorts, 6s.; Calceolaria of sorts, 6s. and 9s.; Dielytra spectabile, 12s.; Cheiranthus alpinus, 12s. per doz., and many others.

Also the following selections of newer varieties:

GERANIUMS, 12 fine show vars., 12s.; 12 superb do., 21s.
FANCY GERANIUMS, 12 beautiful vars., 12s.; 6 for 7s. 6d.
* FUCHSIAS, 12 fine vars., 9s.; 12 superb new vars., 15s.
DAHLIAS, 12 fine vars., 9s.; 12 quite new vars., 21s.
,, FANCY, 12 fine vars., 9s.; 6 quite new, 10s.
* PETUNIAS, 12 fine vars., 9s.; 12 superb new vars., 12s.
* VERBENAS, 12 fine vars., 7s. 6d.; 25 do., 12s.; 12 superb new, 12s.
HARDY BORDER PLANTS, 100 select vars., 30s.; 50 for 30s.
,, ,, superior and new, 50 vars., 30s.; 25 for 17s. 6d.
ROCK PLANTS, 25 select vars., 12s.; 12 vars., 7s. 6d.
ANTIRRHINUMS, 12 fine vars., 6s.; 12 superb new, 10s.
PHLOX, 12 fine vars., 6s.; 25 vars., 10s. 6d.; 12 superb newer, 9s.
PENTSTEMONS, 12 fine vars., 7s. 6d.; 6 vars., 5s.
GREENHOUSE PLANTS, 12 select vars., 15s.; 25 fine vars., 28s.
STOVE PLANTS, 12 new and select vars., 18s. to 24s.
* ACHIMENES, 6 splendid new, 7s. 6d.; 12 fine vars., 9s.
GLOXINIAS, 6 splendid new, 7s. 6d.; 12 fine vars., 12s.
NEW PLANTS, see a List in the *Gardeners' Chronicle* for May 3d, April 26th, and April 19th.

Stamped Catalogues forwarded on application, free.

Remittances requested from unknown correspondents. Post-office orders to be made payable to BASS and BROWN, or STEPHEN BROWN. Postage stamps received for small amounts.

BASS and BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

CHOICE AND CHEAP.—READ THE FOLLOWING!
(Carriage paid; see below.)
Now ready, and may be had gratis on application,

MAY'S DESCRIPTIVE CATALOGUE OF PLANTS, for ornamenting the Flower Garden, and Greenhouse display.

N.B.—All orders above 2*l.* 10*s.* carriage paid to London, or to any Railway Station within 150 miles of the Nurseries, and plants given over on smaller orders to compensate for carriage. Our central position and great facility of railway communication enables us to execute all orders with punctuality and despatch.

The Catalogue comprises the following favourites, viz.:—Calceolarias of the best sorts, Cinerarias, Fuchsias, Scarlet Geraniums (for bedding), Verbenas—the very choicest varieties, Petunias, fine Chrysanthemums for autumn display, Liliputian Chrysanthemums (these are little gems, growing about a foot high, and flowering profusely), Salvias, Heliotropes, Phloxes, new and fine; Antirrhinums, fine; various Plants adapted for Bedding, Climbers of sorts, and Roses in selection. *s.*

ERICAS, 12 fine blooming plants, own selection, per doz., 12
GREENHOUSE PLANTS, 12 miscellaneous sorts, blooming, our own selection, per doz. ... ... ... ... 12
HERBACEOUS PLANTS, in pots, purchaser's selection, per 100 ... ... ... ... ... ... ... ... 63
Do. do. do., our own selection, per 100, 50

The list throughout is divided into sections of the newest and best in each class, and those in more general cultivation; the selection is left to purchasers or ourselves, in the latter case our customers may rely upon our integrity in furnishing good articles, for which we have received many flattering testimonials. Every information given on application.

Address, JOHN MAY, Hope Nurseries, near Bedale, Yorkshire, to whom all Post-office orders must be made payable.

"CANTUA DEPENDENS."
(A beautiful new Hardy Greenhouse Plant from Peru.)

MESSRS. VEITCH AND SON have the greatest satisfaction in offering to the Public the above lovely plant, from the Andes of Peru, where the flowers are so much esteemed by the natives that they adorn their chambers with them on feast days.

It was exhibited in Regent-street on the 15th of April last, and received the "*Large Silver Medal*" (see *Gardeners' Chronicle* of April 19th.)

It was again exhibited at Chiswick on the 3d of this month, and was then awarded the highest prize given for new plants—"*The Silver Gilt Medal.*"

It is a plant of neat habit and foliage, blooms freely in a small state, and may be kept in a cold pit or frame through winter, being of about the same hardiness as the Fuchsia, and as easy of cultivation; from its novelty and beauty, it will be an acquisition to every collection, and be cultivated by every florist. It is figured in Curtis's "Botanical Magazine" for this month, and will also shortly appear in Paxton's "Flower Garden." Good established plants will be sent out on and after the 12th of June, at 21s. each, with the usual discount to the Trade.—Exeter, May 31.

HORTICULTURAL SOCIETY OF LONDON.—NOTICE is hereby given that the Second EXHIBITION of FLOWERS and FRUIT, in the SOCIETY'S GARDEN, will take place on SATURDAY, June 7th.

Tickets can be procured at this Office upon presenting the order of a Fellow, price 5*s.* each; or, on the day of the meeting, at Turnham-green, price 7*s.* 6*d.* each.

PRIVILEGE OF FELLOWS.—Each Fellow of the Society has free personal admission to these Exhibitions without a ticket. He may also personally introduce a friend with an Admission Ticket at half-past Twelve, at Gate No. 4 in the Duke of Devonshire's road; or, if unable to attend personally, his wife or sister may represent him, provided she is herself furnished with an admission ticket to which his signature is attached. Similar privileges belong to Ladies who are Fellows of the Society.

Messieurs les étrangers qui desireront se procurer des billets d'admission pourront en obtenir des mandats en s'addressant à leur Ambassade ou à leur Consulat.

21, Regent-street, London.

HORTICULTURAL SOCIETY, 21, REGENT-STREET.
NOTICE IS HEREBY GIVEN,
THAT
MR. HOSEA WATERER'S
EXHIBITION OF AMERICAN PLANTS,
IN THE GARDEN OF THIS SOCIETY, AT
TURNHAM GREEN,
*Is now open Daily, from* 9 A.M. *to* 6 P.M.

Fellows of the Society are admitted *free*. Tickets for other persons, available for every day except Sundays and the 6th and 7th of June, can be procured in the Society's Garden, price One Shilling each.

The purchase of such a ticket admits the bearer to the Garden without the order of a Fellow of the Society.

The Gardeners' Chronicle.
*SATURDAY, MAY* 31, 1851.

COUNTRY SHOW.—Friday, June 6: Darlington Horticultural.

THE late Indian mail has brought the gratifying and important intelligence that Mr. FORTUNE'S labours in procuring a supply of the finest Tea plants, and experienced Chinese workmen, has been brought to a successful issue. He had arrived at Calcutta with eight Tea manufacturers from the far-famed Tea districts of the north—the first who have ever left their native country from these districts—together with a large assortment of implements used there in the manufacture of Tea. He had also brought in good order 1749 young Tea plants, and about 17,400 *germinating* seeds; a great success, accomplished thus: He had 14 Ward's cases for the young plants. Between each row of plants large quantities of seeds were sown in China when the cases were planted. Two other cases—made to take round some Camellias for the Botanic Garden, Calcutta, were filled with seeds mixed with a little damp earth. The Camellias were planted, and their roots covered with the same mixture of Tea seeds and earth. Thus he had in each box a mass of seeds, say three-fourths seeds and one-fourth earth. In this state the cases were brought round to Calcutta; when they arrived the Camellias were gently lifted out in excellent order, and the whole mass of Tea seeds was just beginning to germinate. It is estimated that the number of germinating seeds in these two cases is 16,000, or perhaps much more. Mr. FORTUNE was about to start immediately for the north-west provinces, the Government having furnished a steamer to take up all the plants, implements, and Chinamen.

It is not in India alone that important measures are in progress for the increase of our colonial resources. Long since, Colonel REID, while Governor of the Bermudas, succeeded in directing the attention of the inhabitants of these islands to the improvement of their cultivated plants; and we now find that his example is followed by his successor. The following is an extract from the speech of Governor ELLIOTT on recently opening the legislative session in the Bermudas—islands remarkably well adapted to the growth of the Orange and Lemon, and quite capable of entering into competition with the Azores: "I still entertain the impression which I expressed on meeting the Legislature last year, that it would be useful to encourage the formation of nurseries of the best kinds of Orange and Lemon trees, as well as other valuable fruits, by the mode which I then suggested, or by any other, which may seem to you to be more suitable. Indeed I think it would repay the outlay to establish and gradually improve a botanical garden; making such appropriation as would secure the services of a soundly instructed and practical superintendent, from some of the approved institutions in England."

Nor does this intelligent officer confine himself to mere recommendations; for at his own expense he has just introduced the Longan and Cookia punctata into the Bermudas, and it is not improbable that a profitable trade may ere long be carried on in the former fruit, which may be expected to find the climate of "the vexed Bermoothes" perfectly adapted to its constitution.

---

IN resuming the observations we last week offered upon the climate of Great Britain it will be useful to glance at the map.

Beginning with a few spots on the southern coast, and near its eastern extremity, we find Folkstone, Hastings, and there may be a few others less known, which show the first indications of the tendencies we meet with in a more confirmed character afterwards. Then come Chichester, Southampton, New Forest, Western Dorset, South and West Somerset, with inland and Northern Devon. These form the first range of an improved climate, on proceeding to the westward from the straits of Dover, and will be found to follow an irregular line, at first skirting the south coast, and then tending inland to the north-west, crossing the Bristol Channel south of Mendip and cutting off the whole coast of South Wales as far as Pembroke. This line, continued to the coast of Wexford and thence to the Shannon, will probably be found to comprise all that can pretend to the name of a mild climate in the British isles.

Much might be added in the way of illustration, both in particularising many places besides those mentioned, as well as in giving instances from horticulture, and even from native botany, in support of these remarks. It is to be hoped that many persons who know the districts alluded to, will still more investigate the subject, and favour us with authentic examples; for the present a generalising view was thought to be most needed.

It will have been observed that in its passage from the Southampton Water to the Bristol Channel, the imaginary line above suggested will nearly follow the direction, if not the outline of the New Forest, the Wiltshire chalk escarpment, and the Mendip hills. This remarkable chain of elevations and formerly desert tracts, has had some influence, in a physical sense (and perhaps in others), in cutting off the south-west of England, and making it in many respects a separate and a different country from the midland, and even the other southern counties. In its farming and general rural economy, as well as in other particulars, it is still so in a great degree.

It only remains to take a brief notice of the peculiarities of our climate, as compared with that of the continent. Where geographical divisions only are necessary to be stated, a general view will suffice to show the resemblances or the differences between our insular position and that of the countries nearest to us in Europe.

The same gradual change from a drier to a hotter summer temperature alternating with an equally dry and colder winter temperature, is observable on the southern shores of the English Channel, that has been pointed out as characteristic of the northern. The maritime districts of Picardy are milder than those of the interior even lying to the south of them; those of Normandy are milder than those of Picardy; and Brittany, especially the western part of it, is said to enjoy a climate like that of Cornwall. The average improvement in latitude of a degree and a half, more or less, tells but little in this case: it is not sufficiently hot to dry up the damps with which the air is, in common with our own, charged by its proximity to the Atlantic, while the general south-westerly direction of the winds blowing up Channel affects only Brittany and the rest of the coast, leaving the interior of France to its ordinary dry, hot and cold, continental climate. The existence of a rising land with such a climate at the back of the French maritime provinces exposes them to a degree of occasional cold in winter, to which ours, though to the north of them, are rarely subject.

The circumstances which have been here sketched out will, it is presumed, go far to explain the seeming anomalies of the climate of the south and west of the British Isles. With regard to the midland counties, it is notorious that their climate has more of a continental character, whether in cold winters, dry summers, or more steady weather. Were the culture of the Vine to be ever seriously attempted for profit in England it is probable that the chief success of the experiment would be found in the south midland counties or in the eastern,—of course on dry soils and in sunny aspects;—rather than in the mildest of the western. A generally stiller atmosphere, which is a condition most favourable to all vegetable development, is more frequent in the midland districts, not merely on account of their distance from the sea, but perhaps also by reason of their protection from the great westerly movement of our winds by the mass of the mountainous land of Wales. Fur-

ther north, where the island is much narrower, the westerly storms sweep over the whole land with redoubled fury, in spite of the ridge of high land (narrow and broken, however) which runs north and south through the counties from Derbyshire to Northumberland.

The climate of Scotland is a subject by itself; lying so far north of both England and Ireland, it has less affinity to, or dependance on, that of the continent; and the variations of weather seem to depend upon the play of a different set of winds from those which affect England at any given time. Hence it has been sometimes asserted to be milder than that of England. The strongly marked features of the country, both geographical and topographical, make the climate of Scotland so dependent on local causes, that it need not be further alluded to in connection with that of England. It is equally unnecessary to pursue the inquiry into the different climates of Europe in this place, although a subject of deep interest in itself, as well as in contrast to our own.

In addition to the foregoing observations, it is important to point out that in the climate of the whole of our south and west coasts, two distinct physical principles seem to be at work: viz., the increase of temperature towards the westward, and the direct and peculiar influence of the sea air. The first of these principles is simply due to the effect of geographical position with regard to the prevalent winds, the gulf stream, &c.; the second, more obscure, seems to proceed from some chemical operation connected with oceanic exhalations, whose subtle and intangible powers can, in our present knowledge of atmospheric chemistry, only be appreciated by their effects.

The first of these principles has been sufficiently explained, but the second requires some elucidation. The first is limited to the western districts, in their full extent; the second seems perceptible, though within a very narrow line, along the entire southern coast, even to the bleak shores of Dover and Brighton.

It is in consequence of this chemical influence of proximity to the sea that, independent of temperature, certain plants can be better grown and flowered there than inland, even under glass; while others, especially Alpines and Ferns, seldom succeed well near the sea. Thus, also, some plants seem to change their nature when growing within the sea-breeze, as Stocks, Wallflowers, Senecio elegans, &c., which become succulent and brittle as a Mesembryanthemum. This chemical influence probably acts both directly by its salts and moisture, and indirectly through them, so as to modify the temperature and prevent exsiccation in weather apparently dry. Hence, in such situations, the constant but slow vegetation; hence the tardy ripening of fruits, though excellent in quality when ripened.

The inland districts, however, alternate with the coasts in some of their advantages. The same wind that drives a rolling fog in from sea, till it stops at the first hills, will often give a fine bright day inland; while a November fog inland is often a perfect summer's day on the coast.

Let any one, in an ordinary winter, cross the country diagonally from some central point of the midland counties, towards the west or south-west coasts. Starting from the plateau of Warwickshire or Leicestershire, and leaving the country as far as Birmingham covered with snow, a sensible decrease of cold will be felt on descending into the vale of the Severn. The Malvern hills will have the appearance of Alps, but on passing them the hills of Herefordshire will be seen only capped with snow, as in that county and in Monmouthshire the difference of climate begins to tell. Proceeding further towards Wales, the mountains, though higher, will probably show less snow, and at last on the hills near the Severn sea, there will be none at all.

Take a similar line from the south-midland plateau of Wilts and Berks. A similar falling off of the signs of winter will be manifest; snow covering all Wiltshire, decreasing in Gloucester and Somerset, reappearing on the hills only of Dorset and Devon, and expiring on Dartmoor.

But in a rigorous winter, the case is, in appearance, reversed; there is then more snow in the western counties than in the midland or east. Then their habitually suspended moisture is, owing to an unusually low temperature, and to the nature of the country, precipitated in squalls and drifts of snow of great depth, and is altogether a worse visitation to the inhabitants than when spread as a carpet over the rest of England. In return, it seldom lasts long in the south and west, nor is the accompanying cold so severe. Short frosts, even when sharp, are one of the advantages of the western climate.

A future opportunity may occur for pointing out some of the characteristics of the climate of Europe in general, and showing how far they tend to illustrate the peculiarities of that of the British Isles. *S.*

---

It will be seen by our advertising columns, that the anniversary dinner of the GARDENERS' BENEVOLENT INSTITUTION takes place on Monday, the 9th of June, under the presidency of Mr. PAXTON, whose name will, doubtless, have the effect of inducing a large attendance. Let us hope that the charity will benefit considerably on the occasion.

This institution has, as it deserves to have, our warmest support; and so long as its management is confided to persons such as those who constitute the committee, there is every hope of its success. The claims, however, upon the charity are so large and urgent—so much, indeed, beyond the means as yet at the command of the committee, that we must once more appeal to the higher classes of the community for aid to an institution founded for the support of deserving men, who have largely contributed to their pleasure, and worn out their strength in their service. The remuneration of a very large number of gardeners is such as to render it almost impossible for those having families to bring up and educate to make an adequate provision for old age, or for the infirmities to which we are all liable, but to which gardeners are peculiarly exposed, from the nature of their calling.

Let us hope, too, that gardeners themselves, if in a position to afford a guinea a year, will at once subscribe to the charity. Should they be so fortunate as never to require the aid of this institution, they will have so much the more to be thankful for. They must also remember, that if by necessity they should be compelled to fall back upon the Society for assistance, priority of subscription will now give them a claim above those who do not subscribe. This is clearly stated in the 6th rule of the charity, and is so obviously just, that we have always felt surprised that it should not have been a fundamental regulation from the very beginning.

---

## ORCHIDS FOR THE MILLION.—No. III.

By T. WILLIAMS, Gardener to C. B. WARNER, Esq., Hoddesdon.

ON THE CULTIVATION OF TROPICAL ORCHIDS.—Among Orchids some are termed terrestrial, by reason of their growing in earth; such as the plants of the genera Phaius, Calanthe, Bletia, Cyrtopodium, Cypripedium, &c.—all derive nourishment from the ground. Epiphytes, the other great class, inhabit trees, from which, however, they derive little or no nourishment. These are by far the most numerous and most interesting. They are found adhering to the arms of living trees, whilst some of them delight in very elevated situations upon high trees. Others, again, grow upon low trees, some on rocks and mountains, some on trees overhanging a river, and some near dripping rocks. The latter, of course, require a particularly damp atmosphere to grow in; others are found in woods, where scarcely any sun can penetrate; these like a shady moist atmosphere, whilst those in more elevated situations do not need so much shade as the last. A knowledge of the different habitats of the various species is essential to the careful grower, so that he may, as far as his means permit, imitate their natural mode of growth; and it is, perhaps, to some inattention to this point that the want of success in the culture of some of the Orchidaceous plants, by even the most successful of our cultivators, is to be attributed.

MODE OF POTTING AND THE MATERIALS TO BE USED.—When the season of rest is over, many kinds will require repotting, but I have not confined my practice to that time only; no season can be dermined on absolutely as the proper one for this operation. The months of February and March are the best time to pot some of them, that is, after the resting season. Those that do not need potting should be top-dressed with good fibrous peat, removing the old soil from the top without breaking the root of the plants. This also affords the means of getting rid of many insects which harbour in the old soil. The pots should be thoroughly cleansed from the mould, moss, and dirt, too often seen covering those in which Orchids are growing. Previously to potting the plants, they should not receive any water for four or five days. Some, however, should be potted at a period somewhat later, viz., just as they begin to grow. All the species of the genera Phaius, Calanthe, Dendrobium, Stanhopea, Cyrtopodium, Brassia, Miltonia, Sobralia, Bletia, Oncidium, and many others, require this treatment. Lælias, Cattleyas, Saccolabiums, Aerides, Vandas, and similar plants, should be potted just before the commencement of their growing season. The chief point to be attended to in all potting is that the pots be well drained; the best material for drainage is potsherds or charcoal. Before potting, be particular to have the pots perfectly clean inside and out, and the broken potsherds should be washed; after this is done select a pot according to the size of the plant; do not give them too much pot room. Some plants will require shifting once a year; others it will not be necessary to shift oftener than once in two or three years; but if a plant becomes sickly or soddened with wet, the best way to bring it into a healthy state is to turn it out of the pot or basket, and wash the roots carefully with some clean water, cutting off such of the fibres as are dead; then to repot it, not giving it much water till the plant begins to make fresh roots. The best pots are those in ordinary use. Some employ slate pots, but they are not, in my opinion, so good for Orchids as those made of clay.

In potting large plants there should be a small pot put in the bottom of the large one; then fill in with potsherds or charcoal broken up into pieces, about 2 inches square, for large plants—smaller plants should not have pieces so large; then introduce potsherds till within 3 or 4 inches of the rim, and afterwards put on a layer of moss to prevent the peat from impeding the drainage, and to let the water pass off quickly. This is of great importance, and if it is not attended to the water will become stagnant, and the soil sodden, which is fatal to the growth of the plant. The grand point to be observed in the successful culture of Orchids, as well as of other plants, is good drainage; without that it is hopeless to keep the plants long in a healthy condition. The best material for potting the different kinds of epiphytes in is good rough fibrous peat and sphagnum moss; after this a layer of moss is applied, then fill up with peat. This should be broken into lumps about the size of a hen's egg; I always use broken potsherds or charcoal mixed with the peat. The plant should be elevated above the rim of the pot 2 or 3 inches, taking care to have all the pseudo-bulbs above the soil; then put some peat on the top of the roots so as to cover them, employing a few small pegs to keep the soil firmly on the pot. After the plants are potted I fix a stick in the centre of the plant, to keep it firm. In shifting I carefully shake off all the old soil I can without injuring the roots. Be careful not to give too much water at first; but after the plants begin to make more root, they may have a good supply. The best material for those in baskets is sphagnum moss and broken potsherds. The basket should suit the size of the plant; but do not have it too large, for it will not last more than two or three years, at which time, probably, the plant will require shifting into a larger one. There should be placed a layer of moss at the bottom of the basket, then a few potsherds, then fill up with moss and potsherds mixed. Take the plants carefully out of the old basket, without breaking the roots, shake off all old moss, place the plant on the new material, about level with the top of the basket; put a stick in the centre, to keep it firm, and finish by giving a gentle watering.

Those plants that require wood to grow upon should have moss attached to the blocks, if by experience they are found to require it; some, however, do better on bare blocks, but then they need more moisture, as they are then entirely dependent on what is obtained from the atmosphere. In fastening them firmly on the blocks have some copper nails and drive them into the block; then with copper wire secure the plants firmly to the wood. As soon as they make fresh roots they will cling to the block, and the wire may be taken away.

THE MATERIAL FOR TERRESTRIAL ORCHIDS.—These require a stronger compost than the epiphytal kinds. They should be potted just when they begin to grow, after the resting season; they do not need so much drainage as Epiphytes. The compost I use for them is turfy loam chopped into pieces about the size of a Walnut, leaf-mould, and a little rotten cow-dung; these are all mixed well together. The plants require a good sized pot; put about 2 inches of drainage at the bottom, on that a layer of moss, then some of the rough peat, and finish with the compost above-mentioned; place the plant 1 inch below the rim of the pot; water sparingly at first, but when the plants are about 6 inches high they may have a good supply.

---

## NOTES OF A TRAVELLER.—No. XVI.

THE GLYCINE SINENSIS, AND WHERE IT IS FOUND WILD.—In the end of May, when the "Overland Mail" puts these notes into your hands, the noble Glycine, or Wistaria chinensis, will be in full bloom at Chiswick, and in many other English gardens. It was introduced, as your readers know, from a garden near Canton—that of a Chinese merchant named Consequa; but it is not indigenous to the south of China, and is rarely seen in perfection there. Indeed, the simple fact of its being perfectly hardy in England shows at once that it has a more northern origin.

Before the last war with China, foreigners were confined to narrow limits about Canton and Macao, where they had no means of knowing anything of the more hardy plants of the north, which they sometimes met with in gardens, and introduced to Europe. Now, however, we can prosecute our botanical researches in a country which is nearly a thousand miles further to the north-east, and at many other places which lie along that line of coast. The island of Koo-lung-sû, for example, near Amoy, was taken by our troops during the war, and occupied by them for some years, according to treaty, until a portion of the ransom money was paid. It seemed to have been a place of residence to many of the mandarins and principal merchants in peaceful times, and boasted of its gardens and pretty fish ponds. When I first saw these gardens they were mostly in a ruinous condition, and everywhere exhibited the fatal effects of war. Many beautiful plants, however, still continued to grow and scramble about over the ruined walls. Captain Hall, of the Madras army, who was stationed there for some time, was very fond of botany, and took great pleasure in pointing out to me all the plants which he met with in his rambles. "I have good news for you," said he, one morning when I met him; "come with me and I shall show you the most beautiful plant on the island, which I have just

discovered. It is a creeper, it produces fine long racemes of lilac flowers before it puts forth its leaves, and it is deliciously fragrant." What could it be? was it new? would it produce perfect seeds? or could young plants be procured to send home? were questions which rapidly suggested themselves. It is only the enthusiastical botanical collector who can form an idea of the amount of excitement and pleasure there is when one fancies he is on the eve of finding a new and beautiful flower. Captain Hall led the way, and we soon reached the spot where the plant grew. There had been no exaggeration in his description; there it was, covering an old wall, and scrambling up the branches of the adjoining trees; it bore long racemes of Pea-shaped flowers, and scented the surrounding air with its odours. Need I say it was the beautiful Glycine. But it was not found in a wild state even at Amoy, and had evidently been brought from more northern latitudes.

When I reached Chusan, in latitude 30° north, I found a remarkable change in the appearance of the vegetation. Tropical forms had entirely disappeared, or were rarely met with. Although the summers were as warm, or even warmer, than they were in the south, yet the winters were nearly as cold as those we have in England. On this ground, and all over the provinces of Chekiang and Kiangnan, the Glycine seemed to be at home. It grew wild on every hill-side, scrambling about in the hedges by the footpaths, and hanging over and dipping its leaves and flowers into the canals and mountain streams.

But by far the most beautiful effect is produced when it attaches itself to the stems and branches of other trees. This is not unfrequent in nature, and is often copied by the Chinese and introduced into their gardens. You can scarcely imagine anything more gorgeous or beautiful than a large plant of this kind in full bloom. Its main and larger branches are entwined round every branch and branchlet of the tree; and from them hundreds of small ones hang down until they nearly touch the ground. The whole of the branches are covered with flower-buds, which a day or two of warm weather brings rapidly forward into bloom. To form an idea of the effect produced by these thousands of long lilac racemes, you must imagine, if you can, a floral cascade, or a Weeping Willow covered with the flowers of the Glycine. There are some large specimens of this kind on the island of Chusan. One, in particular, was most striking. Not content with monopolising one tree, it had scrambled over a whole clump, and formed a pretty arbour underneath. When I saw it last it was in full flower, and had a most charming appearance.

The Chinese are fond of growing the Glycine on trellis-work, and forming long covered walks in the garden, or arbours and porticos in front of their doors. In a former letter I noticed a large specimen of this description in the garden of the British consulate at Shanghae. There is another remarkable one in the garden of a mandarin at Ningpo; growing in company with it is the fine new variety introduced lately by the Horticultural Society of London, and published in the Journal of the Society. In foliage and general habit the two kinds are nearly alike, but the new one bears long racemes of pure white flowers. The kind old gentleman to whom the garden belonged (he is dead now) allowed me to make layers of this plant on the top of his house, and during the summer months, when I was travelling in other districts, attended to them and watered them with his own hands. When I saw him about a year ago he told me he was then nearly 80 years old. One of the gentlemen who accompanied me (Dr. Kirk, of Shanghae), being introduced to him as a medical man, was asked if he could live for one year more. The old man said he knew he must die soon, but he was most anxious to live for another year. His presentiment was but too correct, for the next time I visited Ningpo, about six months after, I found the door of the mansion bricked up, and the garden neglected and overrun with weeds. *R. F.*

## BRITISH SONG BIRDS.

(Cage Birds, No. 16.)

XXXII.—All the nightingales that have arrived this spring, and that are worth caging, have, 'ere this, been safely secured. All you have to do, therefore, is,—to listen with a "cunning" ear, to their vocal powers when confined, before making a purchase. As I have before hinted, much tact is requisite in this matter. Now, if ever, good birds will open up, and sing loud and merrily. After this month, their song will cease until next season. Lose therefore not one instant in making your election.

"Nestlings" will be obtainable at the end of June,—perhaps a week or so earlier. If you are desirous of securing a nest of young birds, make your wishes known early to some of the dealers. In *this* matter they cannot cheat you. Out of a nest, you are likely to rear one or two fine male birds. The hens, when proved to be such, will of course be liberated,—but not in the winter.

"Branchers" will be on sale in July, and should be caged as soon as caught. You will find them, for the most part, cheerful and sociable; and so imitative, that they quickly learn to unite a number of other voices with their own. They possess however, the charm of executing whatever they attempt, to perfection; so that this variety will be pleasingly agreeable.

Branchers and nestlings—the latter in particular—never sing their own natural song only; unless indeed they be brought up immediately under an old steady song bird, and allowed to hear the voice of none other. Here let me caution you, never to forget to pay your "pets" marked attention; for nightingales are apt, if slighted, to grow sulky, and refuse their regular food. This they will do for very many hours. In such cases, you must give way; and win their favour by presenting them with their favourite *morceau*. This will cause them to return to their food. I have seen many a bird exhibit these signs of obstinacy. Indeed I believe some would literally die, before being the *first* to give in. These lovely little fellows know their powers, and *will* be treated with becoming respect. But if you treat them with *affection*—what a reward will be your's! Their motto to a "friend" is,—"*Je ne change qu'en mourant.*" Faithful are they to their last dying gasp. I have proved it, again and again.

*Apropos* of the affection of the nightingale, where he observes a corresponding feeling on the part of his admirer. By remarkably good fortune, one of the most extraordinary of these songsters has recently taken full possession of my garden. I call the gay, joyous fellow "extraordinary," for I never yet heard such seraphic strains, such perfect freedom of song, from any of the tribe,—much as I have had to do with them. And what makes me value this merry little rogue the more, is—his almost incredible tameness. He sings, the night through, just under my chamber window, and seldom leaves the garden, by day or by night, for more than a few minutes at a time. I usually rise to greet him at 5 A.M.; and on venturing a humble imitation of his swelling note, he flies to me at once. Seating himself on a shady bough, and bending slightly forward, there he remains—holding converse with me, so long as my time permits me to tarry; and he improvises such music the while, that I can hardly tear myself away from him. He knows *my* voice, and I know *his*. Thus do we, morning by morning, exchange familiarities; and greatly do I love to return, after the fatigues of a day of toil, to renew our intimacy. I believe the pleasure is quite mutual. I cannot but imagine that this bird possesses an unusual charm; for he has drawn into one focus a host of blackbirds, thrushes, robins, blackcaps, and other vocalists, whose orchestral accompaniments, blending with his own heavenly voice, almost lead us to suppose we are in fairy land. They rehearse early in the evening; and the concert, once commenced, lasts until long after sunrise. I hardly need say, that I now retire to rest with my chamber window *open*.

Yesterday evening brought with it a new moon. For the next fortnight therefore, this melody, in a modified form, will continue. It will then gradually subside. The waning moon, and the jubilee of the birds, will disappear together! Three short months of almost uninterrupted harmony will have been our's,—a treat, as times go, of no common order. Perhaps, this has been one of the finest nightingale seasons ever known. Nor do I remember ever before to have observed so much "interest" shown towards this bird of Paradise. It cannot be his beauty that has worked this charm? Most assuredly not. It may be, that *our* good word has had something to do in the matter. Let us hope so.

The nightingale, so far from being handsome, is of a remarkably common presence; yet has he, "within, that which passeth show." No person, to look at him, would set any value upon him. This bears out my old favourite saying,—that Nature seldom gives rare excellences and a handsome person united. Look at the beautiful plumage of many of the American and other foreign birds—yet have they no voice. Exquisite in form, of faultless symmetrical proportions—yet not one particle of music, or of vocal melody, is there among the entire tribe! Here, again, we find practical instruction; and learn how vain is beauty without mind.

I never see any of these gaudy automata without a feeling of pity. They were never intended by Nature to visit our country; nor were they ever intended to be immured in cages. They cannot be said to "live" here; their's is an "existence" only; for they are never well, never happy. They suffer a martyrdom in their confinement, and die in the very prime of life. I throw out these remarks advisedly, and in the kindest spirit of humanity, trusting they will not fall far short of their intended aim. *William Kidd, New Road, Hammersmith.*

## Home Correspondence.

*Remarks on Climate.*—I send the names of some plants usually cultivated in the greenhouse, which have endured the late winter in this place (Hythe), and also the names of some which survived the winter of 1849 (rather a severe one), and which usually bear the winter here. I do this in consequence of having read the remarks on the climate of Britain in your leading article at p. 323. This last winter Primula sinensis (several plants) has been perpetually in blossom, unprotected in the open border; a cut-leaved sweet Geranium allied to the oak-leaved, is now in bloom, and the scarlet Geranium "Lord Melbourne," is coming into flower, both having lived through the winter without the slightest protection, even of straw or coal-ashes, about the roots; two purple hybrid Cinerarias are in blossom (good heads), having been under similar circumstances in a very cold border; Salvia cardinalis (fulgens) is also in flower, the points only of the shoots being injured; Maurandya Barclayana, against a wall, is uninjured. Amongst the plants which lived through the winter of 1849, and usually survive our winters, are Salvia cardinalis, which in severe frosts is killed to the ground, but springs from the crown; S. patens, sometimes lives; Veronica Lindleyana, hardy as a standard; Eucalyptus perfoliatus? (I believe), Buddlea Lindleyana (blossoming profusely against a wall), Forsythia viridissima. I have Myrtles on an east wall; the broad-leaved one 10 feet high, the narrow and other varieties from 3 to 6 or 7 feet, which bloom profusely, and are never protected in the winter. Fuchsia gracilis 6 feet high, the ends of the shoots only being injured; and globosa, Eppsii, Epps' Monarch, &c., succeed almost equally well, though, of course, their size is not as great. The Hydrangea hortensis is perfectly hardy; at Sandgate you may see plants 5 feet in diameter in the summer, covered with blossom, not having been protected in the severest frosts. Plumbago Larpentæ is now coming up in the borders. I have gathered a fair crop of ripe Black Hamburgh Grapes from the roof of a stable, with an east aspect, without any glass or other means having been applied to forward them. I therefore conceive that the climate of Hythe and Sandgate, from their peculiarly favourable position, forms an exception to the general climate of Kent. *T. D., Hythe, May* 28.

*Ranunculuses.*—I send a specimen of Ranunculus, in proof of the wonderfully mild winter we have had. My roots were planted in November, promiscuously in the borders, and are all in flower, some of them being much better filled in the centre than the one sent. Mine is a very exposed garden, much elevated, and with very little or no shelter, and sloping almost due east, slightly south. It consists of good Ranunculus soil, very deep, and very rich, without being too strong, though if it has a fault, it is on the side of excess of tenacity. The Anemones grown here are many of them 4½ inches, and some of them 5½ in diameter when laid open, and some fully 4, as they hold themselves before they are full blown *Lincolniensis, May* 15. [Your specimen of Ranunculus was early and good. We have, however, seen (May 20th) several small beds of autumn or very early spring planted Ranunculuses in bloom, and in fair condition. The seasons rarely justify planting Ranunculuses, excepting Turbans, in November, and the past winter must be regarded as an exception, rather than a rule.]

*Forcing Asparagus.*—As "J. P." does not seem to fully comprehend my plan of forcing this vegetable, I have ventured to add the following information to what was given at p. 277. My forcing beds are 54 feet long, and produce a constant succession from Christmas to the time of cutting in the open ground. I force the same bed every alternate season. As to the number of heads and their weight per hundred, I can give no correct account, having never weighed them. I may state that they have been finer and better flavoured than any that I ever saw produced by transplanted roots in pits. There can be no question as to the merits of this system over the other method as regards the superiority of the crop, both in size, flavour, and earliness, as well as in the durability of the beds. *J. W., Davyhulme Hall, Lancashire.*

*The Calceolaria.*—Does "J. R." really imagine that I meant the flowers of a cutting differed from those of its parent? Deeming it probable that he did not wilfully pervert the sense of my argument, when I said, that "M. P." like others, might discover the impossibility, or nearly so, of raising plants of chosen form and colour from cuttings; I will proceed to explain my meaning. There are to be found in England large tracts of hilly land, called Downs, the geological formation of which differs materially from most other hilly tracts. They are composed of chalk, the surface soil partakes largely of chalky matter, and it is to this I attribute the almost hopeless task of raising a stock from cuttings. In such localities the Calceolaria will not flourish as it does in other situations where the chalky matter is absent, unless the cultivator goes to a great expense in procuring soils better adapted to its growth. I would add that the north of England, and Scotch cultivators especially, rarely encounter obstacles of this nature, and to those who are permanent residents in such localities, the fact I have just mentioned is almost wholly unknown. *G. H., Tatton.*—For some years past I have raised my plants from seeds as well as from cuttings; but I prefer seeds, except in the case of shrubby kinds, or such choice sorts as I intend for exhibition. I have found the one-shift system to answer my seedling plants admirably. But there is one requisite, above every other, indispensable to the perfect culture of this plant, whether from seeds or cuttings, viz., you must provide for the free access of air to the roots at every stage of growth; and this I should think could not easily be accomplished under Mr. Rumley's plan of placing saucers of liquid manure under the pots. As soon as I find my plants well established, and in a vigorous state of growth, I give them liquid manure in a highly clarified state, about twice a week, till the flowers begin to expand. The green fly is the only formidable enemy to this plant we have to contend with. I find tobacco-smoke to be the most effectual means of destroying it. *C. T., Yorkshire.*—Ah, "G. H.!" I involuntarily exclaimed, after reading his remarks at page 310; the soil of your locality, like that of mine, partakes of some deleterious quality, of which it would be well if we could get rid. "G. H." speaks of "the impossibility, or nearly so," of raising a stock of Calceolarias from cuttings, in certain localities, and my experience in this, in a great measure, corroborates his assertion. How many gardeners on the chalky soils of England have I met with, who entertain similar ideas. Ask them why it is their Calceolarias look so yellow? Their only response is an ominous shake of the head, or a shrug of the shoulder. When I was in Derbyshire, I could grow Calceolarias to any size, with very little

trouble, and great satisfaction to myself; but now, by reason of something (the soil, doubtless), I am only able to grow them from seed, like annuals; and to raise a stock from them after flowering, is, as "G. H." states, almost impossible. *R. Gilbert, Arundel.*

*Durability of certain kinds of Timber.*—Much as has been said on the subject, it is yet a matter of dispute which kind of timber, set in the ground as a gate-post, endures the influences of the weather and other causes longest. It is well known that the part under ground, as well as that above the soil, remains but little injured, while the portion on the surface decays with more or less rapidity, being eaten away, as it were. Now, I am not aware what agencies are at work to effect the destruction of that part which are not in full force elsewhere; but it is certain they are at work, and, sooner or later, they perform their office. Now could some means not be taken to counteract this state of things; charring seems to be the most simple and effectual of any in use, and assuredly it does prolong the existence of the post; but *how* it happens to do so has always appeared to me a difficult problem to solve. Perhaps some of your more learned correspondents will enlighten us on the subject; but if I were to hazard an opinion, I would suggest that the action of the fire, to a certain extent, seals, or rather, sears up the pores or cells of the timber, on the part acted upon, in such a manner as to make them inaccessible afterwards to the action of moisture, and, what may be likewise equally baneful, the air. Whether my theory is correct or not I cannot say, but I know that if two posts exactly alike be put down at one time, one charred and the other not, the charred one will last quite one-third longer than the uncharred one. But there are other queries that seem to puzzle me; a Beech or Hornbeam post, both very hard and heavy woods, are no more durable than Willow or Poplar, and in many cases they won't stand so long. Now, how is this to be accounted for? to all appearance the hard smooth surface of the two woods first mentioned would seem to offer as much resistance to decay as Elm, Larch, Fir, or Oak, but such is not the case; and I know of nothing that will decay sooner than Beech or Hornbeam—Sycamore and Horse-chestnut last about the same length of time. I remember a case in which a considerable length of new park fencing (close paling) was put up by direction of a town agent, Beech posts being used with Oak rails and paling: after a very few years the posts all gave way; part had to be sparred, and others were replaced at a great expense and trouble. I have taken some pains to ascertain the length of time various kinds of timber will stand in the ground without undergoing any preparation before being inserted; and the result of my enquiries is that Larch, when of great age and sound, is equally as durable as Oak or Sweet Chestnut, of which much has been said lately; and when very small pieces of young timber are used, Larch stands pre-eminently first. There may, however, be fancy timbers which are never likely to be produced in useful quantities more durable. I have found an Elder hedge stake, of a circumference of 6 or 8 inches, last longer than any other I have ever seen used. Next to that in point of size is the hard gnarly top of an old Larch, but that can hardly be called fair competition; the Elder outlasts it, but it would be unwise to advise its being generally planted on that account, as I don't know a more useless cumberer of ground than the Elder; and when it finds its way into hedges let it be extirpated without delay. While on the subject of the utility and durability of timber, let me call the attention of the sanguine planter of fancy Pines to the homely fact of enquiring into their probable value hereafter. It would be useless my giving an opinion; but I may mention that no timber I know seems really of less use, where firmness or durability is wanted, than the Weymouth Pine, and I much fear many of the fancy ones will partake of the same bad quality. The old Stone Pine, of which I have seen one specimen of considerable size cut up, is really a useful looking timber, resembling Scotch Fir, which when of suitable age and size, is as good as the majority of Baltic timber, and I would presume that many of the class partaking of the Scotch Fir character will be found equally good. I doubt, however, whether the showy Insignis, and some others, will be found of any further use than that of ornamenting dress grounds. *An Old Sawyer.*

*Eucalypti.*—As attention has been drawn in your pages to the possibility of growing the gigantic Eucalypti of Tasmania in some parts of England as timber trees, it may be interesting to state that there exist in Dorsetshire and Devon three young trees of Eucalyptus, already of considerable size, and which promise, from the number of winters they have survived, and from the vigour of their summer growth, to become ornamental, if not useful additions, to the landscape garden. Of these, one is at Mount Edgcombe, planted in a wood sloping down to the sea. A second is in the ornamental nursery garden of Mr. Veitch, at Exeter, where it is called E. montana. It is the only one that has flowered. The third is at Abbotsbury, about 18 ft. high, and upwards of 2 ft. round the bole, at 2 ft. from the ground. The exact measure at 18 in. above the ground, is 2 ft. 9 in. in girth. It has been planted about 16 years. These three specimens are all different in foliage; yet all seem forms of E. resinifera. E. cordata, or pulverulenta, is well known as hardy against a wall. It is remarkable that all these are glaucous Eucalypti; the dark-green leaved E. robusta, &c., seem, unfortunately, much more tender. *W. T. S.*

*Charcoal.*—Your correspondent, "J. D." (page 309), is wrong in stating that the charcoal made by the process adopted in making pyroligneous acid is the best; it never fetches so good a price as that made in the ordinary way; and whenever it has been used it has been found of inferior quality. *John Stoveld, Stedham Hall, near Midhurst.*

*Hints for Hybridisers.*—Try the various handsome sorts of Rhododendron with the neglected American R. punctatum; a new type of neat small bushes, with more showy flowers, as in the hybrids from caucasicum, with a distinct character, might result. Why are the tall Phloxes always chosen for muling, when the equally pretty and more distinct creeping kinds might afford a fresh set of hybrids better suited for pots, rocks, and small gardens than the larger sorts?—Will Azalea sinensis mule with indica, &c.? *S.*

*Potatoes.*—It is a very mistaken notion to suppose, that because a man plants his main crop of Potatoes in February, he either anticipates or wishes to have them appear above ground early. The object is, to prevent the sets from growing, and to retard, rather than expedite their vegetating. Tubers which sprout much before planting must necessarily be weakened, more particularly if the shoot is broken off, which is generally done. Too much care cannot be paid to the preservation of all descriptions of seed, especially Potatoes, which are so frequently injured by being allowed to heat in masses, impoverishing the tubers, both as food and seed. To see the manner in which Potatoes during the late mild winter have come through the "*Buries*," ought to convince men how destructive that system of keeping Potatoes is. *Falcon.*

*French Notions of English Gardening in the last Century.*—Mason (the author of the Poem on English gardens), commissions Horace Walpole, who was going to Paris, to get him Monsieur Watelet's Essay on Gardens, and desires him to go to see an island in the Seine, near Paris, which the French author had laid out in the true English style. In the volumes just published of Walpole's Letters to Mason, is the following description of this much vaunted English garden *le Moulin Joli*. "I have begun my observations (on the conversion of the French to English gardening) methodically; I have laid the axe to the root of the tree, for I have begun by visiting M. Watelet's Isle, called *le Moulin Joli*, If he has laid the axe to the root, and even to the branches, he has used it nowhere else. Instead of finding, as I expected, a windmill made of ivory and inlaid with false stones; instead of Dryads and Hamadryads gathering Acorns in baskets of gauze, M. Watelet has jumped back into nature, when she was not above 500 years old;—in one word his island differs in nothing from a French garden into which no mortal has set his foot for the last century, it is an ate (I don't know whether I spell well) joined to his terra firma, by two bridges, one of which he calls Dutch, and the other Chinese, and which are as unlike either as two Peas, and which is pierced and divided into straight narrow walks, *en berceau*, and surrounded by a rude path quite round. To give the *étoile* and air *champêtre*, a plenary indulgence has been granted to every Nettle, Thistle, and Bramble that grew in the garden, and they seem good in his sight. The receipt is as follows:—Take an ate full of Willows, cram it full of small Elms, and Poplar Pines, strip them into cradles, and cut them into paths, and leave all the rest as rough as you found it, and you will have a Moulin Joli. You must know this effort of genius is the more provoking, as the situation is charming; besides that, the isle is in the middle of the Seine, every peep-hole (though so small that you seem to look through the diminishing end of a spying-glass), besides terminating on one real windmill, is bounded by a château, a clocher, a village, a convent, a villa where Henrietta Maria was educated, or hermitage, to which Bossuet retired—not to mortify himself, but Fenelon. It is true, you catch these points of view over wide fields of chalk, which would produce frankincense as soon as Grass, and which, if they had symptoms of verdure, were waving ranks of Fennel, I always perceive here, when I am out of Paris; but I never can think myself in the country." *Dodman.*

*Young Trees injured by Rabbits.*—Can you or any of your readers inform me how I can best protect a plantation of young wood from the ravages of rabbits. Last year I planted a small piece of ground with ornamental trees, and not being able to afford a rabbit-proof fence, I find that they are almost all cut over about 3 inches from the ground by these wantonly mischievous little pests. My landlord allows neither shooting nor snaring, and I trouble you in the hope that you can suggest something with which I might anoint my trees, or else some kind of tree or shrub which does not suit the palate of my foe. I have found nothing come wrong to them but Hollies, and they are expensive. In my garden I have another foe to contend with; an insect, or worm I take it to be, from the small holes which I see in the surface of the soil. Whatever it is, it has effectually put an end to my hopes of early Cauliflower and Cabbages for this season. *Jolly Green.* [The paint mentioned at p. 343 of to-day's Paper is said to keep hares and rabbits from injuring trees. As to the worm, try what effect lime-water has on it.]

## Societies.

ROYAL SOUTH LONDON FLORICULTURAL, *May* 28.—There was an interesting show on this occasion, and the day being fine there was a fair attendance. One tent was filled with stove and greenhouse plants, contributed by Messrs. Over, Hamp, Stanly, Fraser, Pamplin, and Hook. A second tent was occupied by Azaleas, Cape Heaths, and Calceolarias, and a third by Pelargoniums and Verbenas. The TULIPS were furnished in quantity, and very good, considering the season.—In the Amateurs' Class, for 12 varieties, the 1st prize was awarded to J. Edwards, Esq., of Wace Cottage, Holloway, for nice blooms of Madame Vestris, Cerise Blanc, Optimus, Polyphemus, Cleopatra, Triumph Royal, Platoff, Byzantine, Claudiana, and Pilot. Mr. Betteridge, who was second, had Glory of Abingdon, Mountain Sylph, Elthiron, Lady Exeter, Polyphemus, M. Catalani, Roi de Siam, Vivid, Triumph Royal, and Holmes' King. Nurserymen:—1st prize to Mr. Lawrence, of Hampton, for Strong's King, Thalia, Aglaia, Norah Criena, Jeffrey's Elizabeth, Everard, Cleopatra, Brown's Polyphemus, Pandora, Lawrence's rose Lucetta, Vivid, and Catalani. 2d, to Mr. Turner, of Slough, for Queen of the North, Triumph Royal, Mary Lamb, Polyphemus, Alcon, Heroine, Pilot, Princess Royal, Catalani, and Strong's King. HEARTSEASE:—1st prize to Mr. Turner, for Constellation, Lucy Neal, Almanzor, Disraeli, Bellona, Mrs. Hamilton, Duke of Perth, Lord Walsingham, Sir R. Peel, Eustace, Constantine, Thisbe, Ophir, Ophelia, France Cycole, Mr. Beck, Climax, Zabdi, Duchess of Rutland, Leader, Madame Sontag, Ibrahim Pacha, Queen of England, Addison, Caroline, Rainbow, Sambo, Supreme, Milton, Master Lacon, Princess, Polyphemus, Mrs. Beck, Viceroy, and Jenny Jones. In the Amateur's Class, the first prize was won by Mr. Betteridge. For Seedlings, Mr. Norman, of Woolwich, was awarded a first class Certificate for a medium-sized byblomen Tulip, named Mr. Smith, and a 2d prize for a rose Tulip, named Princess Helena. Mr. Gaines had some nice Calceolarias, and Mr. Lockner sent a pretty Verbena, an improvement on Desdemona. In a stand of Verbenas, from Mr. Smith, of Hornsey-road, we remarked trusses of the beautiful varieties Shylock and Purple Rival. A first class Certificate was given to Mr. Hunt for his Pansy "Pandora."

---

BOTANICAL, OF EDINBURGH, *June* 15.—Professor BALFOUR in the chair. In taking the chair the Professor stated, that having received inquiries from various quarters as to a criticism which had appeared of the second Edition of his Manual of Botany, in which several glaring errors have been exposed, he considered that he was called upon, as holding the office of President of the Botanical Society, to take the opportunity of stating that he had not edited this edition. He therefore begged to assure the Society, that he was not responsible for the form in which the work had appeared, nor for any inaccuracies that might occur in it. The following papers were read:—1. *Biographical Notice of the late Mr. George Don.* By Dr. Neill. 2. *List of Plants found in Peebleshire.* By G. S. Blackie. Of the plants included in this list the following may be mentioned:—Vicia Orobus, Manorhead; Galium pusillum; Pyrola rotundifolia; Primula farinosa; Betula nana; Sibbaldia procumbens, Manorhead; Saxifraga stellaris; Arctostaphylos Uva-ursi; Hymenophyllum Tunbridgense, and H. Wilsoni. 3. *Notice of Exidia hispidula, Berk., used in China as a remedy in disease, and also as an article of diet.* By Dr. Dill, Brighton. This communication was included in a letter to Dr. Balfour, who communicated it to the Society. Dr. Dill remarks:—"The fungus which I enclose for your inspection was first brought to my notice in Hong Kong as a favourite remedy of the Chinese in attacks of dysentery. It is used by them in the form of decoction, being boiled along with dried plums, the latter being added merely to give flavour, &c., to the decoction. The first time I ever saw it used was in the case of the person who told me of its efficacy in the before-mentioned malady. This man, an English gardener, was suffering from a severe attack of dysentery, and as his house was a most unhealthy one I strongly advised his going into hospital. He said before doing so he would like to try a Chinese medicine, which had been strongly recommended to him by an old Chinaman, a friend of his. I said, 'Take care what you do with yourself, for your case won't do to be trifled with.' Three days after this I was surprised to find him at his work, and well again. 'Sir,' he said, 'this medicine has had such a wonderful effect upon me that I have kept some of it to show you.' The specimen he then gave me I handed to my Chinese servant, who seemed perfectly familiar with it, and speedily obtained me a large supply. I then determined to try it in the first case that came before me. A few days after a sailor applied to me for chronic dysentery, which had been going on for 18 months, having contracted the malady when in China, on a previous voyage. I immediately placed him on a strong decoction of the fungus, which he took in 2 oz. dozes, three times a day; and in eight or ten days he seemed quite cured. Being then permitted to go out, he got drunk, was exposed to night air, &c., and had a return of his malady. Again, however, the same medicine was employed with the same favourable result, and he joined his ship in the enjoyment of recruited health. These two cases made me very sanguine of the value of the fungus as a cure in diarrhœa and dysentery, but future experience by no means realised the hopes I entertained respecting it. Since then I have so often found it fail completely, that I now regard it as being inferior in efficacy to many of the remedial agents we already possess. Mr. A. H. Balfour, in Hong Kong, has also tried it successfully, but I think his experience has been similar to my own. It grows on old, dead trees, and rotten timber; hence, and from its shape, the name by which it is designated in China—'Mok-yii,' the ear of

a tree. The fungus itself is much prized by them as an article of food, on account of its mucilaginous properties. They eat it in soups, stews, &c., and consider it a great dainty. In taste it is very insipid, but certainly not more so than the far-famed bird's nest." Dr. Maclagan exhibited specimens of the plant brought from Penang by Mr. W. D. Maclagan. In that country it is called Sweekiang, and is used for food. 4. *On poisoning with Indian species of Datura.* By Dr. Herbert Giraud, Professor of Chemistry and Materia Medica, in Grant Medical College, Bombay. Dr. Giraud had brought this subject before the Medical and Physical Society of Bombay, and the observations forming the present paper were communicated to the Botanical Society by Dr. Balfour. The very numerous cases of poisoning by Datura that have of late occurred in Bombay, have afforded opportunities for observing the action of a poison, of which but a scanty record is to be found in the standard works on Materia Medica and Toxicology. Several species of the genus Datura are indigenous throughout India; and "Datura alba" (D. metel. Rox. Flora, I., p. 561) and "Datura fastuosa" (Rox. Flora, I., p. 561), are found growing in gardens and amongst rubbish, about villages, all over the country; although the species most familiar to Europeans, the "Datura Stramonium," is unknown here. The intoxicating properties of these plants appear to have been known amongst Eastern nations from time immemorial, and they have long been employed in India, China (where D. ferox is used), and the islands of the Eastern Archipelago to facilitate the commission of theft and other crimes; for which nefarious purposes the Datura Stramonium appears, of late years, to have been in some few instances employed in France and Germany. Here the cases of poisoning by the species of Datura are so frequent, that the natives usually recognise them by their characteristic symptoms. The motives that prompt the administration of the poison, appear to be extremely various. It is remarkable, that although administered under many different circumstances, and with varied motives, it should so seldom prove fatal here, that not a single case, in which the effects of Datura could be distinctly traced, has terminated fatally; and of 51 cases that were treated in the Bombay Hospital during the past year, only four presented alarming symptoms. Notwithstanding the recent prevalence of Datura-poisoning, it has been only on the presumptive evidence of its characteristic symptoms that its action has been inferred. The poison is administered so stealthily, and the natives are so backward in aiding the cause of justice, that it is next to impossible to obtain positive evidence of the administration of the poison, or to trace it to the culprit; although, from their familiarity with its nature, and with the modes of its administration, it is evident that many of the lower orders of the people are acquainted with the adepts who employ it. These remarks, however, apply with equal truth to cases of poisoning by such substances as arsenic and corrosive sublimate, the presence of which may be determined by the surer methods of chemical analysis. From the information Dr. Giraud has been able to collect from natives, it would appear that the seeds are the parts of the plant usually administered. They are powdered and thrown into Rice, Bajree, and other grains; or mixed up with cakes and sweetmeats. Sometimes, however, an infusion or decoction of the leaves is prepared and introduced into the vessels in which the food is being cooked; but of the usual quantities of the seeds employed, or of the strength of the infusion and decoction, Dr. Giraud has had no means of judging. Of the cause that has produced so sudden and remarkable an increase in the use of this poison, it is difficult to form any conjecture. Viewing the most prevalent motive to Datura-poisoning, it would seem as if some regularly organised band of thieves had, within the last year invaded our island. From 1837 and 1838, when a few cases of poisoning, supposed to be from Datura, were noticed by Drs. Bell and M'Lennan, in the annual reports of the Native General Hospital, up to 1848 only from six to ten such cases have been annually recorded; but during the past year, 51 cases have come under hospital treatment. In a note received by Dr. Cleghorn from the superintendent of Thuggee in Mysore, it was stated, that the seeds of Datura alba were employed by thieves to narcotise their victims, and deprive them of the power of resistance. 5. *Report on the State of Vegetation in the Edinburgh Botanic Garden.* By Mr. M'Nab. The latter also exhibited several sections of Oak stems found in the course of excavations made at Tanfield, Canonmills, and read the following notice supplied by Mr. M'Caul, who had superintended the operations:—"In the course of excavating a pit for a new gasometer nine years ago, a number of Oak stems, the largest two feet in diameter, were found, of which Nos. 1 and 2 are sections. At that time I did not take any interest in such things, and therefore cannot give any accurate information regarding them. In the pit now excavating, and from 80 to 90 feet from the one alluded to, two fine trees were found, from which the sections Nos. 3 and 4 were cut. The position they occupied were about 10 feet below the original surface, beneath the lowest bed of gravel, and immediately over the boulder clay, their direction being nearly east and west. Three of the pieces were lying horizontally, and two of them had a rise towards the east at an angle of 10°. At the western part of these stems roots in connection with them could be traced; but they mouldered away to the touch." The sections exhibited have been presented by Mr. M'Caul to the Museum at the Botanic Garden. A specimen of Hyoscyamus raised from seeds communicated to Mr. Moore, of the Glasnevin Botanic Garden, by Major Madden, was exhibited. The plant grows in the Himalaya, and resembles H. albus in some respects. In the open border it attains the height of 2 feet. It has ovate leaves and terminal cymes. The flowers are of a dingy yellow, and the calyx is covered with glandular pubescence. Dr. Douglas Maclagan tried the effect of the plant on the eye. A single drop of the fresh juice caused dilatation of the pupil in 20 minutes, and the dilatation with slight double vision continued for 24 hours.—Dr. Mitchell was elected Local Secretary for Nottingham, in room of Dr. Howitt, who has gone to Australia.—T. Ivory, Esq., was elected a Fellow.

ROYAL HORTICULTURAL OF CORNWALL, *May* 16.—This was the first exhibition for the present year. The prizes were awarded as follows:—Ornamental Plant, in flower, not previously exhibited (Abelia floribunda), Bronze Medal, Mr. F. Passingham. Best 12 Stove and Greenhouse Plants (Azalea indica grandiflora, Aphelexis spectabilis grandiflora, Pimelea Hendersoni, Azalea triumphans, Erica ventricosa incarnata, Eriostemon intermedium, Aphelexis humilis, Euphorbia splendens, Begonia sanguinea, Acacia pulchella, Leschenaultia formosa, Gloxiana Teuchlerii), Silver Medal, Mr. Passingham; 2d (Epacris grandiflora, Sprengelia incarnata, Pimelea decussata, Leschenaultia biloba, Azalea triumphans, A. optima, Tropæolum tricolorum, Vinca ocellata alba, Clerodendron squamatum, Chironia floribunda, Clematis Sieboldii, and a fancy Geranium), Mr. R. Friend, gr. to Mrs. G. C. Fox; 3d (Euphorbia splendens, Clematis azurea grandiflora, Begonia floribunda, Epacris miniata, Gardenia florida, Zichya tricolor, Azalea alba, Erica Cavendishii, Chorozema cordifolium, Oxalis floribunda, Azalea carminata, Corræa ventricosa), Mr. G. N. Simmons; 4th (Clerodendron splendens, C. affine, Leschenaultia grandiflora, Epacris miniata, Vinca ocellata, Tropæolum tricolorum, Aphelexis sesamoides, Tetratheca verticillata, Erica florida, campanulata, Pimelea Nieppergiana), Mr. Daubuz. Best 6 varieties of ditto (Aphelexis purpurea macrantha, Epacris miniata, a Gompholobium, Leschenaultia formosa, Chorozema rotundifolium, Begonia alba coccinea), Mr. F. Passingham; 2d (Tetratheca verticillata, Ardisia crenulata, Erica ventricosa superba, Pimelea Hendersoni, Aphelexis purpurea macrantha, Azalea triumphans), Mr. R. Friend; 3d (Eutaxia myrtifolia Leschenaultia biloba, Adenandra speciosa, Clerodendron affine, an Everlasting, Eriostemon intermedium), Mr. Daubuz; 4th (Pimelea hispida, Tropæolum tricolorum, Azalea indica alba, Epacris grandiflora, Epiphyllum Jenkinsoni, Nerium Oleander), Rev. T. Phillpotts. Best specimen of Stove Plant (Torenia Asiatica), Rev. T. Phillpotts; 2d (Clerodendron affine), Mr. Daubuz; 3d (Euphorbia splendens), Mr. F. Passingham. Best Greenhouse specimen (Aphelexis purpurea grandiflora), Mr. F. Passingham; 2d (Pimelea Hendersoni), Mr. R. Friend; 3d (Chorozema varium), Rev. T. Phillpotts. Best 6 Orchids, in flower (Phaius Wallichii, Calanthe veratrifolia, Oncidium flexuosum, and two Lycastes), Rev. T. Phillpotts; 2d (Cattleya Mossiæ, Calanthe veratrifolia, Oncidium leucochilum, and O. pumilum), Mr. G. N. Simmons; 3d (Lycaste cruenta, Maxillaria pubescens, Cattleya Forbesii), Mr. W. M. Tweedy. Best specimen (Cattleya Mossiæ), Rev. T. Phillpotts; 2d (Calanthe veratrifolia), Mr. W. M. Tweedy. Best 6 Gloxinias, Gesneras, Achimenes, or Sinningias (Teuchlerii, Fyfiana, Maxima, Sinningia guttata, Achimenes grandiflora, A. picta), Mr. Daubuz; 2d (Gesnera Douglasii, G. Suttonii, G. bulbosa, Achimenes picta, A. grandiflora), Rev. T. Phillpotts. Best 6 Bulbous Plants, in flower, Mr. R. Friend. Best 6 Geraniums (Orion, Beck's Rosy Circle, Arnal's Virgin Queen, Forget-me-not, Marmion, and a Seedling), Mr. R. Friend; 2d (Gulielma, Field Marshal, Gaines' Meleager, Beeswing, Cruentum, Forster's Constance, Mr. Daubuz. Best 6 Fancies (Queen Victoria, Anais, Lady Rivers, La Belle Africana, Unique, Sidonie), Mr. F. Passingham. Best 6 Heaths (Bowieana, Cavendishii, ventricosa conspicua, v. purpurescens, v. fasciculata rosea, v. superba), Mr. F. Passingham; 2d (elegans, perspicua nana, Loddigesii, dilecta, and sauveolens), Mr. Daubuz. Best Specimen Heath (Erica coccinea minor), Rev. T. Phillpotts; 2d (ventricosa blanda), Mr. F. Passingham. Best collection of Azaleas, Rhododendrons, or Kalmias (Azalea indica grandiflora, Herbertii, triumphans, optima, splendida, Broughtonii), Mr. F. Passingham; 2d (Indica alba, Exquisite, Rosea, Duke of Devonshire, Knight's optima, Rosea punctata), Mr. Daubuz. Best specimen of ditto (variegata), Rev. T. Phillpotts; 2d (optima), Mr. F. Passingham. Best collection of Cinerarias (Cerito, Annie, Miss Harriet, Climax, Purpurea, Princess Royal), Mr. F. Passingham; 2d (6 seedlings), Mr. W. M. Tweedy. Best specimen of ditto (Cerito), Mr. F. Passingham. Best collection of Calceolarias (Elegans, Eclipse, Lucy Neal, Rebecca, Alboni), Mr. Daubuz; 2d (Delicata, Queen of Beauties, Captivation, Resplendens, Standard, Sir C. Napier), Mr. F. Passingham. Best specimen of ditto (Seedling), Mr. Daubuz. Best collection of Heartsease (Zabdi, Sylph, Prince of Orange, Optimus, Cornish Lass, Rainbow, Caroline, Polynices, Climax, Duchess of Rutland, Supreme, Marchioness of Lothian, Magnificent, Attraction, Superb, Juventa), Mr. W. Woolcock; 2d (Ophir, Lady Sale, Taglioni, Lucy Neal, Splendid, Blue Perfection, Great Western, Caroline, Oats's Seedling, Climax, Malvern, Punch), Rev. Canon Rogers. Best 6 Roses in pots (Baronne Prevost, Niphetos, Duchess of Sutherland, Highclerc Seedling, Madame Laffay, La Belle Allamande), Mr. F. Passingham; 2d (Souvenir de la Malmaison, Géant des Batailles, &c.), Mr. R. Friend; 3d (Triumphant, Géant des Batailles, Madame Desprez, General Lamoriciere), Admiral Reynolds. *West Briton.*

SOUTH DEVON HORTICULTURAL, *May* 20.—This new Society held its first exhibition in the Royal Botanical and Horticultural Gardens, Plymouth. Several prizes were awarded; but we have only been furnished with a list of the awards, without the names of the flowers for which they were given.

## Garden Memoranda.

W. O. HUNT'S, ESQ., STRATFORD-ON-AVON.—In the garden here, there is one of the handsomest plants in the kingdom, of the Chinese Glycine, or Wistaria sinensis; it covers at the present time 2243 superficial feet of wall; there are at least 25,000 racemes of blossoms upon the tree, the effect of which is magnificent. *J. B.*

LADY SCOTT'S, PETERSHAM.—This interesting villa stands on the banks of the Thames, near Richmond. In front of the house is a small, but well arranged flower garden, whose beds are quite a mass of gaudy flowers all the spring. This is effected by means of Anemones, Hyacinths, Tulips, Narcissus, Nemophila, the beautiful hardy yellow Primrose, and its delightful companion the single dark blue Russian Violet. These are succeeded by the usual bedding plants; the walks here and there are trellised over and covered with Rose trees, as is also the west front of the house. The greenhouse was full of handsome flowering plants, and the lawn closely mown and in beautiful condition. The kitchen garden is small but compact. As in the ornamental ground, everything there does much credit to Mr. Winton, who has been gardener to Lady Scott for these last 20 years. There are two glass houses in this garden, which are used for wintering plants in for turning out in summer, as well as for growing Strawberries, Vines, &c., in. Mr. Winton has two ways of growing his Asparagus—in beds, and in single rows; but he says the single rows are always in cutting a week or more before the beds. This place is altogether quite a blaze of flowers during the summer. The moment a set of plants is done blooming another lot takes their place, from the reserve garden, and in this way the garden is constantly maintained in great beauty.

## Miscellaneous.

*Method of Preserving young Fruit Trees from the attacks of Hares and Rabbits.*—All lovers of gardens know by experience that hares and rabbits devour with great avidity the annual bark of young fruit trees, and particularly of dwarf Apple trees, among which the most healthy and vigorous are always destroyed the first, in consequence of their bark being the most tender and savoury. As soon as the ground is covered with snow, these animals, no longer finding anything in the fields on which they can browse, begin their devastations in the gardens: if they are numerous, and the fall of snow heavy, a few nights only are sufficient for them completely to ruin the most beautiful plantation, and to annihilate the result of many years of labour and care. Happily, nothing is more easy than to place these trees beyond the attacks of these marauders protected by the law. The following is the plan I have adopted with complete success during the last six or seven years. I mix about 4½ pounds of quick-lime, in lumps, with 2½ gallons of water, and add a few handfuls of soot, stirring the liquid until the two substances are intimately incorporated. I then take a handful of Rye-straw and bind it on a stick to form a kind of brush, with which I grey-wash the trunk and branches of my trees from the ground to at least a yard above it; for should the snow drift by the wind against the foot of the trees, the hares, by means of the inclined plane thus afforded them, would be able to attack the trees at a much greater height. The wash, applied hot, has also the advantage of preserving the bark of the trees in a state of perfect health, and preventing the increase of moss, which is often pernicious in its effect, and always very disagreeable to the eye. It is desirable that this preservative application should be made in dry weather, in order that the mixture on drying may adhere to the bark; for should it rain at the time, or immediately afterwards, the mixture would be washed from the trees, and it would be necessary to re-commence the operation. If the mixture also is applied during a frost, there would be little chance of perfect success; as the part of the bark on which it would be laid would be thawed. If, however, through want of foresight, a frost sets in during the course of the operation, and it becomes urgent to complete it, we may do so with perfect success by choosing that moment of the day in which the sun strikes most strongly with his rays the trees on which we wish to operate. Three gallons of this wash are sufficient to secure two or three hundred dwarf trees from the ravages of hares; a result that may be obtained for a pennyworth of lime and the day's work of an active labourer. This plan is equally infallible for the preservation of grafts and all nursery collections. *From the French of the Baron Vander-Straeten (in the Journal Agricole de Verviers.)*

*Sale of Orchids.*—A small collection from Veragua and Sierra Leone, was sold the other day, by Mr. Stevens, at the following prices:—The Sweet Trichopil, 2*l.* 15*s.*; a Brassia, 1*l.*; Trichopil, new sp., 1*l.*; the Long-tailed Lady's Slipper (Cypripedium caudatum), from 2*l.* to 9*l.* 10*s.*; Sobralia labiata, from 1*l.* to 1*l.* 4*s.*; a Huntleya "with white flowers," ditto; the Spotted Saccolabe (S. guttatum), from 2*l.* to 3*l.* 15*s.*; Angræcum caudatum, from 1*l.* 10*s.* to 2*l.* 2*s.*; other lots, of which there were in all 155, realised from 1*l.* to 2*l.* per lot. At a previous sale, which consisted chiefly of Dendrobes, a few plants of D. albo-sanguineum of Lindley, a beautiful new species, fetched from 2*l.* 12*s.* 6*d.* to 3*l.* 5*s.* each.

*The Gardnerian Herbarium.*—In consequence of the lamented death of Mr. Gardner, instructions have been given to the executors to sell, without reserve, the entire of the above-mentioned collections of this gentleman, which have recently been received in London for that purpose. The whole Gardnerian Herbarium, that is, the collection arranged by himself for his own use, it is wished should be disposed of separately and by private contract; it is admirably arranged, and as fully and correctly named as probably any of like extent, all the specimens upon the best stout demy folio paper, measuring 16 inches long by 10½ inches broad. Every genus is included in one or more envelopes of the same paper in folded sheets, and marked on the outside with the name of the genus, that of the Natural Family, and numbered according to the numbers and arrangement in Endlicher's "Genera Plantarum." The specimens are invariably in excellent condition, no trace of insect having been seen in any of them; and we have reason to believe that they are all poisoned. From as accurate a calculation as has yet been made, there are about 14,000 papers containing specimens, and we think we are within bounds when we say that there are 12,000 species of Phænogamous plants and Ferns. The collection is, as may be antici-

pated, extremely rich in Brazilian and Ceylon plants, gathered mostly by himself during 5½ years' travels in the former country (and they are the authority for his many published species), and during his 4 years' sojourn in Ceylon. It further includes numerous plants prepared by himself in Mauritius, and a still more extended assortment from the Neilgherries; a rich collection of Malacca plants from the late Mr. Griffiths; Hong Kong plants from Captain Champion; South European ones from Mr. Bentham, and others from various parts of the globe; the whole forming an extensive and well-authenticated herbarium, such as is seldom offered for sale to the botanical world. Mr. Samuel Stevens, 24, Bloomsbury-street, London, is charged with the disposal of this, and further particulars may be obtained on enquiry of him, as also a sight of the plants. The books, almost exclusively botanical, and a few unarranged bundles of duplicate plants, will be sold by auction hereafter at Mr. J. C. Stevens's Room, King-street, Covent-garden, London.

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

There are many common plants which, if grown well, make a splendid appearance in the greenhouse or conservatory in the early part of the winter, when the generality of plants are going out of flower. Among these are the various Salvias, some Begonias, Plumbago capensis, Veronica salicifolia, &c. If these are now planted out in rich soil they will make magnificent plants by September, when they should be taken up, potted, trained, and placed in a shady situation to recover; and then brought into a light house, when the finest display of flowers will be obtained, at the most acceptable period. It is at all times, and with every one, an important object to preserve plants in flower as long as possible. To this end, as soon as their blossoms are perfectly expanded, they should be removed to a cooler atmosphere than that in which they have been grown, and carefully shaded from gleamy sunshine. To counteract the drying effects of strong currents of air, which are unavoidable in hot weather, the house should be kept moist by frequently sprinkling the floor and walls, or both plants and flowers will flag, in spite of the shading; much, however, may be done by hanging a thin bunting before the openings, and occasionally syringing it; this breaks and cools the current of air as it passes through it. In dull or damp weather, however, a directly opposite mode of proceeding must be pursued; moisture is then injurious, and must be carefully avoided; and the plants should stand sufficiently far apart to secure a full and free circulation of air amongst them. Let no blossoms remain after they fade, nor ever allow the energies of a plant to be exhausted in producing seed, unless it is positively required. Plants of which it is desired to make large specimens in the shortest possible time, should not be allowed to produce flowers until they have attained the desired size. All specimen plants should have plenty of room, and should be occasionally turned round, in order to prevent their growing one-sided. Leaves of Gloxinias should now be inserted into pots of sand; these, if well managed, will form strong bulbs this season, and will flower during February and March in 6-inch pots.

FORCING DEPARTMENT.

Pineries.—Look carefully to the fruiting plants, to see that they are not overburdened with suckers, and let them have an occasional watering with liquid manure, to assist the swelling of the fruit. If the plants, which are just on the point of showing, are in pots, it will be an advantage to shift them immediately into larger ones; to top-dress them with some rich turfy loam, or to turn them out entirely into the soil, which is by far the most preferable method. Where the pot system is pursued, many of the plants, especially of the young stock, will require repotting; and at this time they should receive a large shift, as their most active growing season is now approaching. After potting, a closer and moister atmosphere must be kept up for a few days, till they begin to root into the new soil. No plant stands in greater need of shading during bright sunshine than the Pine-apple; but as it is not only unnecessary, but injurious in dull weather, the canvas should be so adjusted, by means of rollers, that it can be applied or removed at pleasure. Vineries.—If the fruit is all gathered in the earliest house the Vines should again be treated with a moderately warm atmosphere, and syringed daily, to destroy insects, and to keep the foliage in a healthy state as long as possible. In order that the Vines may have every means of recruiting their energies for next season, let them have occasional waterings of liquid manure of moderate strength.

FLOWER GARDEN AND SHRUBBERIES.

All is now hope and activity with the enthusiastic gardener, in anticipation of the speedy realisation of the dreams of floral splendour, which he has been indulging in for the last six months; and for the accomplishment of which he has, during that period, striven most energetically. While this state of things is gradually developing itself, let due care be taken to have every part of the grounds in the most careful order. As the young plants progress, some will require pegging down, and others tying up. For the former purpose, small Birch hooks are most substantial for plants of a stiff habit; but many plants, if once fixed in their position, retain it, either by emitting roots or by the natural inflexibility acquired by their stems. For the fastening down of such plants, we reserve all the roughest and coarsest of our bass matting, and cut it into pieces about 6 or 8 inches long; these we form into loops, which clip the shoots, and the ends are fastened into the ground with a blunt dibble. In performing this operation, the heads of the plants should be turned towards the north, as the young laterals will be drawn by the light towards the other points of the compass, and by this means the beds will appear well filled from all sides. The young plants in the beds will be considerably benefited by stirring the soil among them with a small fork, especially when it has been caked over by rain. This operation will at the same time destroy weeds, and the ground will keep clean twice as long as it will with merely hoeing and raking, and it will also admit rain more freely, and retain the moisture longer than when the surface is smooth.

FLORIST'S FLOWERS.

The season for Tulips will now be getting over, in the southern counties, whilst we hear that the shows in Lancashire, and northwards, will take place next week. We would remind the amateur to take care of the offsets. These, generally being exposed, require taking out of the ground first, so soon as the foliage becomes yellow: by attending to this, the bulbs dry of a nice light brown, a point of some importance. As for the main beds, we would remove the side awnings, but we have our doubts about the propriety of taking off the cover; if the foliage is in a healthy state, we believe they will be in a much finer state next season, by keeping them from excessive rains, which have a tendency to cause a grossness which florists would rather avoid. Pinks and Ranunculuses will now require considerable care—the spindling flower stems must be tied to neat sticks, and as soon as green-fly appears, brush them off with a camel-hair pencil; a man will go over a very large collection in a short time. They will require plenty of water, and occasionally liquid manure. Keep the Ranunculuses free from the Cicada spumaria, or "froth louse," which will often locate itself on the stems; shade seedlings from direct sun—exposure to its warm rays is prejudicial. Dahlias.—Plant out directly, &c.

KITCHEN GARDEN.

Every means should be put in practice for checking the ravages of insects of every kind with which gardens are now teeming, and which if not prevented will commit serious havoc among the crops of fruit and vegetables. Slugs and snails are most easily destroyed by picking them by hand during moist evenings and mornings, and wireworm may be attracted by pieces of Carrot, Turnip, or Beet, put into the ground where they may be doing mischief. The Leek is becoming so favourite a vegetable, that it will well repay a little additional care in its cultivation, its value depending upon the production of a long, thick, well-blanched stem. They may be grown in one season to 14 or 16 inches in length, and upwards of 2 inches in diameter; and from their growing so closely together, they form one of the most productive of kitchen-garden crops. The ground should be trenched 18 inches deep, the bottom of the trench being stirred up with a fork, and 4 inches of good rotten manure laid on to it; over which the whole of the soil from the next trench should be placed. If the ground has not been prepared previously, it is a very convenient course of proceeding to carry on the trenching and planting together, so as to prevent in a great measure the compression of the soil after or during planting. This is the more necessary in the method about to be described, as raking or forking about the plants will, for some time, be impossible. The plants should be put in about 6 inches apart, and 9 inches from row to row. Premising that the soil is sufficiently moist to prevent its falling in, the holes for the plants should be made 14 inches deep, with a dibber 2 inches in diameter, and into each of these a plant should be dropped and watered. The plants are thus placed in the most favourable position for growing, which they will continue to do till Christmas. Forking or stirring the ground among growing crops is highly beneficial to them, and it is at the same time an excellent method of destroying weeds, which are now advancing rapidly. Cutting should now be entirely discontinued from a portion of the Asparagus beds, especially from those intended for forcing early next winter. Continue to put in successional crops of Peas, Beans, Lettuces, and Turnips. A few rows of Cauliflowers, Cabbages, and autumn Broccoli, should be planted at intervals of from 10 days to a fortnight; selecting the strongest plants from the beds, and lifting and transferring them with as much earth as will hang to their roots. If Beet, Parsnips, or Carrots, have come up badly, sow again directly, as they will still have time to make useful roots. Some trenches of Celery should now be planted, and more got ready for successional plantings. If the Cardoon trenches have not yet been prepared, lose no time in doing so; as the first sowing should now be made in the open ground, and another in about a fortnight or three weeks. When sown too early, they are very apt to run to seed.

State of the Weather near London, for the week ending May 29, 1851, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 7th, 1846—therm. 90 deg.; and the lowest on the 3d, 1837—therm. 35 deg.

## Notices to Correspondents.

Accuba japonica: *J G.* Abortive fruits are occasionally produced by it. Perfect fruit, containing good seed, never.

Books: *Mrs G C* will find a little book called "Traité sur la Camellia," by M. de Jonghe, just published at Brussels, a safe and useful guide. The best separate work on Heaths is that of the late Mr. W. Macnab.—*A A.* The last edition of the Horticultural Society's Catalogue of Fruits was published in 1842. Its price is *3s. 6d.* to Fellows, *5s.* to the public.‡

Dried Apples: *Thos Osborn.* We believe that the tree from which the Normandy Pippin is gathered is the Reinette grise, largely cultivated in Normandy. It is understood to be prepared by scalding, so as to remove the skin, and then by simple drying.

Gooseberries and Currants: *G L.* They may be formed into standards by pruning away the lower branches, so as to induce them to make a clean bare stem.‡

Hardy Azaleas: *M L.* Cut them down in November next.

Horticultural Society: *Beginner.* Send your name and address to the Secretary, 21, Regent-street, London, and a schedule will be forwarded to you.‡

Italian Gardens: *Winter Garden.* You can either use sand of various colours, not very easy to procure; or you may have the walks constructed with cement artificially coloured. Any ingenious plasterer would point out the method of colouring it.

Names of Plants: *A S.* It looks like a fragment of the Carob tree, Ceratonia siliqua, and if so, is a greenhouse plant.—*L L L.* Flowers and leaves of the Bird Cherry.—*E S.* This is the Hippeastrum vittatum; the plant which was so called, by an accidental slip, was, if our memory is true, H. reticulatum. If not, and you can send another of the latter, its exact name shall be ascertained.—*Tim.* 1, Cyanotis vittata; 2 and 3, no flowers; 4, seems to be a morsel of Acacia decipiens.—*A B C.* 1, Anthoxanthum odoratum; 2, Poa pratensis; 3, Alopecurus pratensis; 4, some indeterminable Carex. We really hope you will find some friend able to give you the names of such common things.—*E M E.* The Alpine Rose is R. alpina: it is more likely to be found in Botanic Gardens than elsewhere, as it is not handsome enough for nurserymen.—*Sub.* Geranium pratense, and Vaccinium resinosum.—*Quercus.* 1, Solidago virgaurea; 2, Mentha incana, apparently. — *Reader.* 1, Euonymus latifolius; 2, Staphylea pinnata; 3, Lathyrus tuberosus; 4, Aristolochia tomentosa.—*J L.* Ranunculus aquatilis, Veronica chamædrys, Sedum album? a monster. —*M L.* 1, Lastrea dilatata; 2, Asplenium Filix-fœmina; 3, Lastrea Filix-mas; 4, Polystichum lobatum; 5, too young, and the specimen quite crumpled—may be an Asplenium Filix-fœmina; 6, Polypodium Dryopteris; 7, Cystopteris fragilis; 8, Lastrea dilatata. *S.*—A few inquiries stand over for further consideration.

Nightingales: *John Bailey.* Considering the long distance your bird has travelled, and the disturbance he has experienced so soon after being caught, it cannot be a matter for wonder that he should "not sing yet." If he is of a quiet disposition, your having removed the tissue-paper from before his cage thus early will be of little consequence. Pay him every possible attention, and treat him to a feast of ants' eggs from time to time, and the chances are he will prove his gratitude, at an early day, by making his sentiments known in *song. W. K.*

Pears: *Inquirer.* The Beurré Rance Pear, grown on walls, does not always ripen well. When this appears likely to be the case, the fruit should be put into a temperature of 60° in February. In order to prevent damp and mouldiness, give plenty of ventilation when the external and internal air is of the same temperature.‖

Pines: *H B.* You have ample bottom heat. If you want to grow good Pines, read Glendinning on the "Pine-apple," and follow his instructions exactly; when you have done that, and had some very good Queens, then read other treatises on the subject. In the meanwhile study attentively the directions in our "Calendar," which are given by one of the best practical gardeners in England, living in a climate like that of Cheshire.

Rose Trees: *M W K.* They are attacked by honey dew. The cure is to keep the plants in more vigorous health and a damper air.

Strawberries: *J Kenny.* A nicely-fruited plant. Will you favour us with your method of cultivation.‡

The Sola: *J R.* The botanical name of the Sola or Indian Cork, whose pith is used for electrical purposes, is the Æschynomene called Iagenaria by Roxburgh. It is a perennial, and requires to be treated like an aquatic.

Vines: *Gobemouche.* A Vine from 5½ to 7 inches in circumference may bear a hundred weight of Grapes, provided you allow it sufficient space.‖—*J M.* You had better take off the new bunches.

Walls: *W F.* Unnail the trees, and grout the face of your wall with good Roman cement; it will fill up the nail holes, and restore a clean face to the brickwork.

SEEDLING FLOWERS.

Calceolarias: *R R.* 1 is a nice flower, but it wants size; 2 is worthless.* — *E T.* Useless as show flowers.* — *R H.* Too "ribby," but beautiful in colour.*

Cinerarias: *P W.* Not received.*—*W C.* Unequal to kinds already out.*

Epiphyllum: *J G.* Very large and showy.*

Fuchsias: *E Woodward.* Received in bad condition, but apparently inferior to some of the light kinds now in cultivation.*

Pansies: *S B G.* Very much inferior to flowers of the same class already out.*—*W D.* The eye extends to the margin of the bottom petal, otherwise it would be a fair average flower.*

Pelargoniums: *W H D.* Quite fallen to pieces when it reached us. The upper petals appear to be good, but the under ones are defective in shape.*—*Beta.* Can you favour us with a better specimen? That sent was too much shrivelled up for us to offer any opinion on it.*

Petunias: *W C.* Very pretty medium-sized flower.*

Erratum: In the advertisement of the "Award of Prizes" of the Royal Botanic Society's Exhibition, at p. 322, it is stated that a Certificate was given to Mr. Willmer, of *Sudbury.* It should have been Mr. Willmer, of *Sunbury.*

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS,

AS THE

ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by Dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

NEW TURNIP MANURE, 50*s.* a Ton.—Mr. POTTER can strongly recommend the above as a cheap and efficient Manure, and capable of raising heavy crops. Delivered free on rail. The Bags to be returned or paid for.

POTTER'S GUANO, 7*l.* per ton; SUPERPHOSPHATE OF LIME, 6*l.* per ton; GYPSUM, 25*s.* per ton, including bags and delivery on rail.—28, Clapham-road-place, London.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

PEAT CHARCOAL can be had of G. H. FOLEY, Essex Wharf, Lea Bridge, Middlesex. Agent, by appointment, to the Irish Amelioration Society. Price at the above address, of the unmixed Charcoal, 60*s.* per ton, sacks included; mixed with night-soil, 45*s.* per ton, sacks included; or delivered at any of the London Railway Stations or Wharfs, mixed, 50*s.* per ton, and unmixed 65*s.* per ton, sacks included.

ARTIFICIAL MANURES.—PRIVATE INSTRUCTIONS in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.

Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 10*s.* per ton; and for 5 tons or more, 9*l.* 5*s.* per ton, in dock. Sulphate of Ammonia, &c.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9*l.* 10*s.* per ton, or 9*l.* 5*s.* in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

HOSE FOR LIQUID MANURE, Fire-engine, and agricultural purposes, made of canvass, lined and coated with gutta purcha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure, it is extensively used at the Government public works; also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY, empowered by Act of Parliament to execute all works of Drainage (including outfalls through adjoining estates), to erect Farm Buildings, and carry out every kind of permanent improvement upon estates under settlement; to provide the money, or to enable the landowner to employ his own capital, and execute the works by his agents, and to secure repayment of the outlay by charge on the property improved spread over a number of years.

Applications to be addressed to WILLIAM CLIFFORD, Secretary. Offices, 52, Parliament-street, London.

DO YOU BRUISE YOUR OATS?

HORSE KEEP.—Oat Bruisers, Chaff Cutters, Ploughs, 42*s.*, Shares, 5*s.* per dozen; Rollers, Wheat Mills, Bean Mills, Steam Engines, Scarifiers, Turnip Cutters, Dressing Machines, Drills, Threshing Machines, Wood and Iron Harrows, Steaming Apparatus, Scotch Carts, Hay-making Machines, Horse Hay Rakes, and Drug Mills. First class goods warranted. MARY WEDLAKE and Co., 118, Fenchurch-street. Most liberal discount for cash. Goods delivered free. On receiving six postage-stamps a list, with 107 engravings, will be sent free.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abethaw Lime, and Roman Cement. Fine Black, 25*l.* per ton, and Rich Purple-brown, 20*l.* per ton.—Offices of the Company, 1, New Broad-street, London.—JOHN A. WEST, Secretary.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.

PATENT VULCANISED INDIA RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and) Manufacturer, Goswell-road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use; are particularly suitable for Fire Engines, and are found exceedingly useful in dwelling houses for conveying Hot or Cold Water to Baths, &c.

Testimonials and prices may be had on application to the Manufactory.

N.B. Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

All Orders or Letters addressed to J. L. HANCOCK, Goswell-mews, Goswell-road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boats, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

**The Agricultural Gazette.**

MEETINGS FOR THE TWO FOLLOWING WEEKS.

| | | |
|---|---|---|
| WEDNESDAY, June | 4 | Agricultural Society of England. |
| THURSDAY, — | 5 | Agricultural Imp. Soc. of Ireland. |
| WEDNESDAY, — | 11 | Agricultural Society of England. |
| THURSDAY, — | 12 | Agricultural Imp. Soc. of Ireland. |

THE pains of newspaper editors are guessed at by everybody; some of their pleasures are unsuspected: for instance, it would hardly be thought what a store they have in hand of the pleasures of imagination.

*Omne ignotum pro magnifico* is a well-worn scrap from TACITUS. OSSIAN attains the sublime by veiling his heroes in mists and obscurity. Painters arrive at the same end by similar means, whereto MARTIN and DANBY bear witness; and TURNER, though of late incomprehensible to vulgar eyes unassisted by a pair of distorting spectacles, is pronounced by some *cognoscenti* to have reached the acme of art. IRVING'S unknown tongues had great success in their day; and some few of our correspondents, to descend a little, seem to think that they are likely to add to the glory and repute of the *Agricultural Gazette* the more they mask themselves and their proceedings under the vague and the anonymous.

This morning comes a letter *viâ* the *Gardeners' Chronicle* Office. We open it in tuneful mood, singing to ourselves the charming air,

"Oh where! and oh where! does our correspondent dwell?
He or she dwells far away, in the place no man can tell;
And it's oh! in our heart that we nothing know right well!"

So much the better for the pleasures of imagination. If people put a plain question, with full particulars, and their real name and address, as they would to a solicitor about a three-farthing debt, they would get a plain answer, and there would be an end of the matter. But instead of this, the poetic faculty has to go to work. The postmark, if any, the orthography, the calligraphy, the style, the *soubriquet* adopted, have all to be meditated upon. Dulness would be non-plussed, but genius cannot. The editorial faculties rouse themselves, and as a clever actor interests his audience, be the part assigned him never so meagre, so *we* flatter ourselves to have built sundry pleasing edifices, some in the palatial, some in the summer-house style, with a quantity of bricks and mortar, the scantiness of which would astonish our readers.

And now to the letter of our fair or gallant *incognito* or *ta*. It will be seen that no breach of confidence, which we would scorn towards man or woman, is about to be committed. The handwriting looks feminine, but we cannot exactly say; the spelling indicates no great learning; but polyglott scholars, in their confusion of tongues, are more liable to these slips than people of fewer acquirements. If we gave a *fac simile*, who could tell the more for that? The *time* of year of the writing is given, which is something; it was neither written last month, nor next week, but May 8th of *some* A.D. or B.C.

"Sir,—I am about to erect a poultry-house, for the accommodation of 50 fowls, which must be confined to their house, and to the walk in front of their house. The fowl are to be kept for their eggs, and not for breeding; and I enter into the speculation for profit, and not for pleasure. I should be exceedingly obliged if you, or some of your correspondents, would give me a plan of the dimensions, cost, &c., of such a building. It must be substantial enough to keep out the theif [so in MS.], and the cold; roomy enough, and cheap enough—and my object will be attained. And I will remain, while eyesight and income last, your reader and subscriber, H. ——."

Bravo! well done! May your shadow never be less! But (again singeth the Editor),

"Oh where! and oh where! doth our correspondent dwell?"

We have readers and subscribers in the five quarters of the globe, and wish to oblige them all. But a speculative answer must be confined to the British Isles, else we shall write the paper full, to the exclusion of the advertisements, which will displease our proprietors. So, *imprimis* as to materials; if you dwell in Caithness you will use slate, of which we have seen capital pig-sties there; it in the New Forest, prigged wood may come cheap; if in Suffolk, clay clumps may answer; if in Cambridgeshire, squared chalk; if here, or there, bricks, or stone, as it may be respectively. As to dimensions; are you a rural, suburban, or a city person? Will your walk be in the purlieus of the Poultry, or amidst the villas of Cheltenham? Or, will you be at liberty to enclose a small slice of Newmarket Heath or Salisbury Plain? The fowls are to be confined to their walk, as well as to their house. Are you near a fishing town, where worn-out nets are to be had a bargain? Or are you located next door to a skilful twister and interlacer of iron and other wires? Profit is with you the object: here, where this is written (you have no right to ask for *our* card of address, it is an impenetrable secret), *farmers* are selling eggs 24 a shilling; sometimes the identical coin will purchase even 30. Cheap materials and labour are necessary to the erection of your egg-producing establishment, if you hope to undersell *them*, whose hens have no such interest on their capital to pay out of their profits; *unless* you are a London milkman supplying Belgravia, and can get from 3*d.* to 6*d.* for every *warranted* new-laid egg; *or* have a stud of those Cochin Chinas which lay a half-crown every time they cackle,—which half-crown will soon become half-a-sovereign as amateurs improve in wisdom. But it cannot be such fairy-land birds as those, as *they* incubate; whereas yours are to be kept for their eggs solely, and *not for breeding*. If you do not keep everlasting layers, what will you do with your hens when they *will* sit? Certainly you will not treat them cruelly—dip them in pails of water, or thrust feathers through their nostrils. Eat them, then? One man's poison is another man's meat; but we will shut our ears to the sound of your dinner-bell till the course of incubators is digested and done with. *Quoad* the cold which you wish to keep out; if you are in Cornwall, you may dispense with what is indispensable among the Cheviot Hills; and anent thieves, if you erect your poultry house on certain lands in Ireland, the natives will steal *you*, or at least your life. In some districts in England poaching and fowl-stealing are found to bear an inverse proportion to each other, the sum total of the two being tolerably constant.

"But where! and oh where! does our correspondent dwell?"

So long as $x$ remains an unknown quantity, the formula of the ablest mathematician remains inapplicable. We *would* design a fowl-house and walk, but cannot. In truth, anonymous communications are as useless and non-practical as they are un-English. The Mysterious Lady is not looked up to with respect; the Mysterious Gentleman, were he to appear, would be set down as a charlatan by all except nincompoops. The precise and the real is the only entity to be grappled with, for any satisfactory result to come of it.

"Some there are that shadows kiss;
Such have but a shadow's bliss,"

said SHAKSPEARE. IXION embraced a cloud in place of a goddess, obtaining in recompence for his adventure a set of monsters and a severe punishment. Public writers might devote their whole energies and waste their entire time in the gratification of a complete seraglio of such clouds and shadows, if they did not resolve to cut scornfully all that does not come before them in an actual shape. Time, and the power of man's brain, *are* brief and intermittent. So, "I love my love with an H.,"—in these matters it is best to drop the plural We—and there stop in the amorous suit, without advancing a single letter further. Pity! but never mind. Perhaps the hand-writing was only feigned to be that of a lady. H, after all, may be the initial neither of high-born HARRIET nor handsome HELEN, but may really belong to some hirsute HENRY, or even if bad spelling be a guide, to a *h*ignorant *H*EDWARD, or a *h*awkard *H*ANDREW. We will not, therefore, quite yet devote ourselves to misanthropy and turnpike-gate-keeping, but still endeavour to answer, as well as we can, questions that strongly remind us of the schoolboy query, "What do you think of the Romans? Eh?"

## REPORT ON THE AGRICULTURAL SECTION OF THE GREAT INDUSTRIAL EXPOSITION OF THE NINETEENTH CENTURY.

No. IV.—We have now noticed most of the implements for tillage, and come next to Division B of Class 9, viz., "Drilling, sowing, manuring, and hoeing machines." The first DRILL that met our view was one manufactured by J. Guest, of Bedford, and called a "steerage drill." It is an improved form of the "Bedfordshire drill," invented at Woburn about 40 years ago. The axle-tree precedes the drill box, having two carriage wheels, with wooden spokes and iron rims or fellies. From this axle a pair of light wooden bars pass to some distance behind the drill, connected by a cross-bar, having a pair of handles at each end; by means of which the drill-man may steer the machine to a nicety while he is

attending to the cups and coulters. The cup barrel is turned by spindles and pinions connecting it with the wheels in front. The coulters, eight in number for corn, are scimitar-shaped or made with cutters curving up in front like the toes of our ancestors' boots; and are forced into the ground by an equal pressure upon each, given by a system of coupling levers from the centre of the machine. A similar drill, but with smaller coulters, is shown, for sowing Turnips, &c., with manure; the manure coulters being followed by horse-shoe irons for covering the manure before the seed falls. These may be useful little machines, but they have few advantages beyond the frame for easy guidance.

W. Busby exhibits a drill, which we should imagine would be useful on light peaty soil, when it is not desirable to have it broken up after it has been trodden solid by sheep. The levers carry scarifier tines, resembling small double mould-board ploughs without shares. The seed drops into the furrow opened by these tines. Each has an independent vertical motion; and the whole can be lifted at once by chains hung upon a long bar raised by a lever. There is a steerage wheel in front, turned by a lever crossing over the top of the machine.

A small drill (maker not named), distributes the seed without cups; sliders along the bottom of the box, being shaken to and fro by zigzag wheels on the carriage wheels. The slider in that part of the box intended for seed vibrates a number of horizontal segments under fixed brushes; these plates having each a circular hole which, by alternately coinciding with another hole below, and with the plate through which it is perforated, emits the seed intermittently, as in a drop drill. In the manure box, the slider is toothed like a rack, and rubs over a slit reaching from end to end, thus regulating the flow according to the progressive speed of the machine.

The difference observable in the sowing machines is very remarkable—some being of colossal dimensions, and covered over with a complication of chains, levers, and gear-work; while others are pretty toy-like pieces of mechanism, suited for operation in the paddock and shelter in the attic.

There is one of the smaller kind which, from its singular appearance, we must try to describe. It is exhibited by J. Gilbert, of Wardour-street, Soho, London; and seems to be all vitals without external covering, having no long box to hold its machinery, as in most drills. A light square frame of wood, about 7 feet long by 4½ feet wide, is supported about 2 feet from the ground. It is drawn by shafts; and in front is a wheel like that of a Bath chair, which can move any way. The back part has another frame about a foot below it; and an axle carrying an iron roller about a foot in diameter, and in five parts. Across the top of the frame, and about the middle of it, is an iron axle with eight cup-wheels and a band-wheel, about 2½ feet in diameter, turned by a strap from the roller. To each cup-wheel there is a small box or hopper, having inside a motionless brush, and a stop slider, with spiral spring to keep it open. These sliders can be pressed simultaneously by a rod and lever, to stop the feed. The seed runs from the cup-wheels down spouts to the coulters, which are wedge shaped or double winged, and fixed upon a bar or axle immediately above them; this bar is divided into two, and by turning either of these by a lever, four coulters are lifted together out of the ground. Behind the cup-wheels, and lower down, is a broadcast trough, with brush-wheels, &c., turned by pulleys from the axle. This, we suppose, is for sowing Clover, or small seeds; the grain sown by this machine must be a very diminutive quantity, indeed. Those who approve of thin seeding, and do not care to have the power of drilling from a peck or two to several bushels an acre, as may suit circumstances, may be inclined to purchase.

J. J. Rowley, of Cuckson, Worksop, exhibits an "improved machine for dropping peat, bone-dust, Turnip, Rape, or Mangold Wurzel seed, &c., patent." This drill deposits the seed or manure at intervals by an endless vertical strap, with flaps of leather projecting upon it, descending in a spout, open on one side—the flaps, a few inches apart, acting as valves to receive the seed, &c., falling from the cups, conduct it downward between them, as in cells, and drop it behind the coulter in separate lumps.

Ransomes and May have patented a "Universal Corn and Seed Dropping Machine," which appears well calculated to perform all that is required of a machine for this purpose. The frame is carried upon two large wheels, as in a common drill. In lieu of coulters, seven curved seam-pressers are attached to the levers, which rise and fall by a parallel motion; but the seams may also be formed either by drag coulters of similar form to dibbles, or by plain drill coulters. Above the levers are seven boxes for seed, terminating below in valve boxes, or depositors, following the pressers, and acting independently of them. A series of cams on an axle in front of the machine turned by wheel-work on one of the carriage-wheels, push or knock seven rods backward and forward; these by small cranks at their other ends working the valves in the depositors with a vibrating motion. These appear to receive the seed at one end of the stroke, and emit it at the other; a valve at the bottom of each depositor opening for the seed finally to escape, which it does within a few inches of the ground, thus insuring a great degree of regularity. The instant the horses start, the seed commences dropping with unerring uniformity of distance and quantity, and ceases at the same instant the horses stop; thus overcoming a defect which exists in most machines for a similar purpose. This machine will deposit a few kernels at a time, at detached and equal spaces, with greater precision than by hand dibbling; it can be adapted to all kinds of grain or seed, by changing the cups; will deposit any quantity of seed per acre; and can be regulated to drop the seed at intervals, so as to range in parallel lines, either directly or diagonally across the land or stetch, as well as lengthwise, in the direction of its draught.

Among the novel and yet famous machines of the day stands the Liquid-manure Drop-drill, invented and patented by F. Chandler, of Aldbourne, Hungerford, Berks, and manufactured by F. R. and J. Reeves, of Bratton, near Westbury, Wiltshire. Scoops, like those of a dredging-machine, take the liquid from a metal tank or cistern on wheels, and throw it down large drill pipes or spouts. The Turnip seed is let run into the same spouts—a slider, worked to and fro by a zig-zag groove on a drum or wheel, shutting and opening the seed spouts just above the point where they enter into the larger ones, so as to cause the intermitting or dropping action. Plain water, or liquid manure, or dissolved manure, such as superphosphate of lime, &c., may be sown by this machine; and the certainty of a Turnip crop in a season of drought hereby insured. While noticing this machine we may just refer to another of the same inventor—viz., a liquid-manure distributor. In this contrivance, instead of having spouts with a chain of buckets or scoops to each, a number of long zinc troughs, extending the width of the cistern, are carried upon endless chains within it, and fling the water, &c., over the back of the box, a ledge being there placed from which the liquid falls in a stream.

In the manufacture of drills for general purposes, Garrett and Sons, of Leiston Works, Saxmundham, Suffolk, and Hornsby and Son, of Spittlegate Iron Works, Grantham, Lincolnshire, undoubtedly stand unrivalled by any other makers, whilst rivalling each other. We dare not presume to draw comparisons between the machines of these firms, except in particulars that are easily discernible. Both have drills with a fore-carriage steerage; a triangular frame reaching from the frame-work of the drill on large wheels to a fore-carriage which has an axle as wide as that of the drill, only with smaller wheels; and the draught is taken from the upright spindle in the middle of this fore-carriage. This used to be guided by handles connected with it; but so much labour was required to hold it, that when the wheels passed over a large clod or stone, a strong man could not possibly prevent its swerving. Garrett's contrivance for overcoming this difficulty is a semicircle fixed upon the fore-carriage with its centre coinciding with the pivot on which the carriage turns. This iron arc is tightly pressed, by means of screws, against two small friction rollers within it, and situated on the triangular frame of the drill. The carriage is thus held steady by the friction, but yet not so stiffly but that it can be easily moved by hand. Hornsby's device is a "patent rack and pinion;" by which a man or a boy holding a crank handle attached to the pinion obtains a far greater leverage power, and can with ease keep the steerage wheels in the track or mark left by the drill wheels during the preceding course.

Garrett's drill for general purposes, is a remarkably neat machine; the simply loosening two screws and lifting off of the hinder and upper portion of the box converting the drill for all sorts of seeds and manure into one for only corn and manure. The seed coulters are attached to small levers suspended to the larger levers carrying the manure coulters; by which arrangement each one has an independent vertical action. Two sliders admit the manure to the distributing roller, raised or shut down by short levers having brass indexes or gauges to note the extent opened. The bottom also of the manure box beneath the roller, and over the edge of which the manure falls, is slided backward or forward by levers, so as to regulate the quantity sown. There is a slider above each cup-wheel to regulate the supply of seed; and all these are opened and shut by one handle, furnished with a gauge, though each may be altered separately, if required, without a pin or screw being withdrawn. The box is to be raised higher or lower above the frame, according to the size of the wheel used in gear with the teeth on the carriage wheel—a brass gauge-plate indicating the requisite heights. Levers are employed for this purpose, in place of nuts and screws; and, indeed, in every part of the machine, screws and racks and pinions have been discarded, and the choice given to the simple and direct lever.

Garrett's "drill for small occupations" has an admirable contrivance for obtaining a regular seeding on hilly land. The horses walk faster down-hill than up-hill, and when the cups are consequently revolving more rapidly, it is found that they throw the seed into the funnels, in addition to lifting and emptying it, so that a thicker seeding is the result. To remedy this, the barrel is worked from either end by wheels a little different in size; and by means of a lever and chains connected with it, by a single raising or depression of this handle, one end of the barrel is dropped into gear and then the other taken out, while the horses are going, so that no stoppage whatever need ensue; the alteration being made in an instant, according to the ascent or declivity of the ground. The same lever can take the barrel out of work altogether. The coulters are not in a row, but arranged so as to be alternately forwarder and backwarder, in order to facilitate their working. As the levers are all of equal length, if the weights with which they are loaded were equal, the pressure upon the forward coulters would be greater than on those behind; the weights, therefore, are properly proportioned, and so made that the drillman cannot possibly put the light or heavy ones upon the wrong levers by mistake. This drill will sow from 2 to 14 pecks of grain, or from 1 to 6 lbs. of seed per acre. A "manure and Turnip drill" has an admirable contrivance for making the manure "run." Many schemes have been tried for this purpose, and hitherto without entire success. Garrett invented a revolving bar, with pins on it, and made this rise and fall so as to squeeze down the manure into the delivery-box. Hornsby made his revolving stirrer slide to and fro endways, so as to leave no atom of the manure unmoved; but, for all this, the potterer would every now and then obstinately work clear of the clotted powder, which cohered together in a mass above it, until broken and pushed down by a stick, or drill spud. But in this drill, when the potterer works clear, a simple pulling of a handle sets the manure running again; an iron bar passing round the end and front of the manure compartment, inside, a little higher than the revolving stirrer, being lifted up and let fall again, so as to cut off the manure from lodging against the sides of the box. The Turnip and Mangold Wurzel cup-wheels are not enclosed in a long box, but are placed upon an axle behind the manure-box, each having a small seed hopper attached, and both cup-wheels and hoppers slide along the axle into different places, according to the number and situation of the coulters.

Hornsby and Son have made a great many improvements in the drilling-machine; one of them remedying what has always been a great imperfection in all drills, viz., their irregular conducting of the seeds to the ground. Tin cups, working one within another, have always been employed for conveying the seed to the coulter levers, which must be allowed free play up and down without altering the flow of corn or seed. The tins continually vibrating, more especially in windy weather, bounced the seed from one cup to another, consequently delivering it very irregularly, more particularly so with Beans or Peas. It was desirable, therefore, both to improve and simplify this part of the machine. Hornsby's "Patent Flexible or Elastic India-rubber Tubes," have supplied all that was wanted; the seed dropping down one single pipe, passes to the ground with the greatest nicety and precision, and neither wind nor rain has the slightest effect upon it. Hornsby has also an improvement for causing damp manure to run; by moving a lever, the stirrer is put in or out of action; and by pulling another lever, the front of the manure box, which is moveable, is brought forward. The slides for seed and manure are moved, not by simple levers, but by racks, pinions, cranks, and worms,—a complex, though accurate arrangement. In order to insure an equal pressure upon the coulters while they are diagonally placed, for the sake of freer working, the lever ends are not differently weighted, but the levers are fixed upon two coulter-bars, one behind the other. By the equal pressure, the seed is deposited at a uniform depth. The seed coulter-lever is attached to the larger coulter-lever underneath, and rises and falls independently of it. The upper lever is bent sideways, so as to leave room for the seed pipe; but as the weight is thus hung, as we may say, out of the straight line, we should think this would have a tendency to rack the lever joint. By the double-actioned lever, there is no difficulty in depositing corn, seeds, and manure regularly at any depth, one below the other. Most of the drills with double coulters have irons of a horse-shoe form between the manure and the seed coulters, to cover the manure, lest the seed come in contact with it. Hornsby has contrived an "improved patent convex rake," that is, a semicircle horizontally set, which covers up the manure with the finest mould, knocking aside the clods on each side the coulter-channel; and the seed coulter then follows and deposits the seed in the fresh stirred soil. The greatest novelty among the drills is Hornsby's Patent Drill, which, instead of having the barrel turned by a system of wheel-work at each end, with wheels to take off and on, has a number of different speeds in a case in the middle of the seed-box, a spindle connecting them with one of the carriage-wheels. The different speeds are set in train by spindles, and a single handle set in different notches. The slides are altered by racks, pinions, &c. The coulters are attached to a bar with "swing" action, which in a great measure compensates for the absence of a steerage. The box is not supported at each end, after the common method, but at the centre, and can be tipped more or less obliquely either way, so as to suit the most hilly land. This is done by a patent action at one end; consisting of a horizontal axis, having screw threads running in different directions, so as to form right-hand and left-hand screws on its two halves,—after the pattern of a railway-carriage link: by turning this with a crank, 2 bars, meeting at their upper ends, are brought from a slanting into a vertical position, or *vice versâ*, their upper ends being connected with the box. The drill-box is thus slanted, and held firmly in any required position, thus preserving its level over sloping land.

There are several machines in the court intended to lessen the labour, as well as equalise the result of broadcast sowing by hand. J. Windsor, of Oswestry, shows a barrow drill for sowing "all Grass seeds and Turnips on the flat." A long trough has a spindle with circular brushes upon it,—the quantity of seed being regulated by a disc of copper, which, being turned round, presents different numbers of holes of varying size, through which the seeds are to pass. J. Watt, of Biggar, Scotland

exhibits an improved broadcast sowing machine, for both grain and Grass seeds. The frame is on three wheels; the trough, which folds into three by two joints, is about 20 feet long, and iron fan-tailed pinions are substituted for the brushes. An index meter tells the number of revolutions. Garrett shows a broadcast barrow drill with a partition in the trough, for Rye-grass and Clover to be sown separately—the distributors being wheels and brushes. We observed also some examples of the driller attached to the plough, to sow on the preceding furrow.

Not content with the drop-drill mode of sowing, farmers have thought it desirable to obtain a machine for performing the identical operations involved in the process of dibbling. Not satisfied with the revolving-drums with trap-doors of Hornsby, the valves of Garrett, the tumblers of Ransome, and other inventions, most of which (excepting, perhaps, the last-mentioned) drop too much seed and manure together in each bunch; they want an implement that shall make the round holes, and leave a kernel or two in each, with less labour and time, and greater precision, than by men with pairs of dibbling irons, followed by slippery and heedless boys' fingers. Accordingly, the manufacturers have devised engines for the purpose, some for manual, some for horse-power; some light as playthings, others massive with timber and cast-iron; and most of them too complicated and delicate in detail to be understood at a glance.

The first DIBBLING MACHINE that struck our notice was the Patent Walking Dibble, invented by R. H. Nicholls, Elizabeth-street, Eaton-square, London; to the eye, at first sight, appearing to be a square-set, light, iron framing, all levers and connecting bars, with four long dibblers at one end, two handles at the other, and a balance weight in the middle; standing on four legs, the two in front terminating in spikes, and the hind legs resting on feet. By alternately lifting and bearing on the two handles behind, the implement advances at a slow gallop; the dibblers between the two front legs making holes as they fall, and leaving seeds in them as they rise. The dibble points are solid, and slide up into brass sockets to let the grain drop out. It is assuredly ingenious, and we hope the workman, taking counsel of his muscles, will not condemn it to inglorious rest.

The next was a patent seed-dibbler, invented by J. Eaton, of Woodford, near Thrapston, Northamptonshire. It consists of a long wooden frame, upon four wheels, the front wheels being made for steering; but whether it is for a horse to draw or men to push, we have not yet determined. The hind wheels are drums, each having four studs on its inner side, which lift and let fall a lever frame, to which are suspended two parallel rows of dibblers—six in each row in the direction of the movement of the machine. The ends of the dibblers are formed like two spoons set close to each other, one-half sliding up to let the seed escape. A lever is provided for raising the jumping-frame out of work. The machine is about 10 feet in length. We are unable to detail any of its good or bad qualities.

Saunder and Newberry's (of Norton, Oxfordshire), Patent Dibbling Machine, is one of those ponderous and expensive-looking engines to which the farmer has generally a fixed aversion; but this, we believe, has the credit of having performed its work well for many years. A strong square frame of wood, on wooden wheels, and drawn by shafts, carries one, two, three, four, or five large circular dibble wheels, which have dibbles projecting from their circumference, and intricate mechanism inside for depositing the seed. The dibblers are made in two halves, one-half of each being raised by an inclined curve, as the dibbling-wheel revolves in order to emit the seeds. There is one hopper to each wheel, the seed entering the wheel near its centre. The seed, delivered in a continuous flow by a drill-wheel, falls into cells or the spaces between large teeth, which catch it in pretty equal quantities as they revolve. From these the seeds pass in separate compartments to each dibbler. The earth is cleaned from the dibble-wheels by revolving scrapers of a peculiar shape, each having three dovetail blades; and as they are fixed in bearings at right angles to the dibble-wheels, they engage with the dibbles and are turned by them, in their rotation cutting out the soil clogging the wheels.

The "Improved Patent Horse Seed Dibbler," of C. Lampitt, of Neithrop, near Banbury, is evidently an alteration or improvement of Newberry's. As in the last machine, there are four iron box-wheels on an axle, with mechanism inside. The dibblers do not consist of halves like spoons, one sliding against the other, but are made whole, of the requisite conical form. A hollow box, called a "tumbril," occupies the inside of the dibble, and by protruding at the back of the dibble, just as it leaves the hole, lets the seed out. Instead of entering the wheel near its centre, the seed here passes into it as close to the circumference as possible. Each dibbling point has a funnel converging from it towards the inside of the wheel; these, in descending, pass the feeding-roller of the small hopper; and as the feed-roller and funnels conducting the seed into the tumbrils both move in the same direction, and as the seed has to fall so short a distance, a great degree of regularity is obtained. An eccentric motion closes the tumbrils as the dibbles approach the ground, thus preventing their being choked with dirt. The revolving scrapers are worked by a motion independently of the dibbles, by which the wear of both scrapers and dibbles is prevented. The wheels, of course, are of considerable weight; and while a toothed-wheel and pinion work the barrel and chains which raise them out of work, a break assists in lowering them to the ground. *I. A. C.*

## ON THE INTRODUCTION OF THE DRILL CULTIVATION OF BEANS INTO BELGIUM.

[Translated from the French of the Baron de LAFONTAINE.]

It has often been said, and said with truth, that there is nothing absolute in agriculture. Theory ought necessarily to have general laws; but it belongs to practice to select those which are capable of receiving an advantageous application. It is thus that the cultivation of the Bean, with a view to the production of seed, rather than as a green crop, so extolled in England, is not generally adopted by ourselves in Belgium, because all the circumstances of our soil and climate do not offer a complete correspondence with those in England, and consequently the Bean crop in Belgium is not uniformly a lucrative one. On this account, we shall only address ourselves on this occasion to those farmers in parts of the country where the Bean is successfully cultivated as a green crop, and often grown with Vetches and Peas. It is a question whether in these localities the drill culture of Beans, as producing the greatest amount of seed, would not be preferable to the broadcast system, so long pursued in them; and it is to this point that we wish particularly to direct the attention of those farmers by means of direct experiment. Sir John Sinclair reports, in his treatise on practical agriculture, an experiment made on three-fifths of an English acre, of which one-half was sown broadcast, and the other half in drills. It was found that, independently of the economy of the seed sown, the produce of the crop was greater in the drilled portion than in the broadcast, in the proportion of 11 to 9. The same field being sown with Barley in the following year, the crop was still more considerable in the drilled part, in the proportion of 34 to 27. This trial was made about 30 years ago, and from the publicity given to it, has much contributed to the establishment of that system in England. The adoption of drill cultivation, in general, belongs to a period that is fast approaching. If with our neighbours in Great Britain its advantages are no longer disputed, we have the satisfaction also to know that with our progressive farmers in Belgium a lively prejudice exists at the present time in its favour. It is even probable that in due time the application of this method will become the common rule. Can we indeed doubt that it will be so, when we reflect that broadcast sowing is a simple imitation of the procedure of nature, while the drill system constitutes its perfection? In reference to the origin of this improved system, it may be remarked, that if the facility offered by it in the cultivation of certain plants, has been the original spontaneous cause of its adoption, the reasonable desire so long felt to arrive at the suppression of fallows has tended strongly to its establishment.

It is not repose, strictly so called, that we wish to give the soil, but an increase of fertility by the different manipulations facilitating the successive disintegration of its molecules, and tending to the destruction of weeds. The drill cultivation of many kinds of plants known to be less exhausting, has been considered as a real fallowing in this sense, in consequence of the different preparations such system requires, without the deficiency which a fallow occasions in the general account of the farm, and in that production of manure which root crops in the other case so much promote. These truths, indeed, are well known, and scarcely require to be stated; but it is always well to repeat them, for the purpose of directing their application in a rational way; for it is almost inconceivable how the farmers in certain districts, unhappily still numerous in our country, can continue at the present day to sow Beet, Carrots, Turnips, and Beans broadcast. These crops replace fallows; but if we do not give them all the preparation they require, that is to say horse-hoeing, proper and uniform aeration, by means of placing in rows, earthing up, &c., how can we wonder at the disappointment of the farmers? Is it, under such circumstances, surprising that the produce of land under grain crops is in certain localities not so considerable as when the pretended repose of the land in fallow had been scrupulously observed? The rigorous deductions we ought to make from this very simple consideration, should induce farmers to multiply the modes of cultivation which fallowing affords us, retaining its advantages without its inconveniences. The drill husbandry of Beans is one of this number: amelioration of the soil, destruction of weeds, increase of crops, and diminution of the chances of failure, are the results of this method. Are such, it may be asked, the results of the broadcast system? Assuredly, it produces neither amelioration in the soil, increased amount of crop, or any of the advantages just specified; neither does it attain, either uniformly or completely, the object generally assigned to Bean cultivation, namely, that of a cleansing crop. To merit that character it ought to effect the complete destruction of weeds. Now this case never occurs under the broadcast plan of sowing; for a great number of plants, especially the Sow-Thistle, obstruct, and, by their reproduction, deteriorate the subsequent crop. We may remark, that we are here speaking of circumstances attending Bean cultivation, when entirely successful, under the system in question. But what happens when the crop is short, or altogether a failure, a result which occurs at least five times in ten years? In such case we have to wait for the rotation of a root-crop to repair the evil caused by the practice of a vicious system. If it be asked, whether Beans under such conditions can be regarded as a cleansing crop, I reply that they cannot, if we persist in the broadcast system of sowing them; but that they may be regarded in that light, if we adopt the drill cultivation.

We have thought it right to make a trial of the two systems previously to recommending either of them; not that we had any doubt on the subject, inasmuch as the results obtained in England on soils analogous to those of Hesbaye, where our own experiments have been made, were sufficient of themselves to establish our conviction, but because there are many truths in agriculture which can only be propagated by the evidence of actual experiment; or rather when reasons are based on indisputable facts occurring in a known locality, or on soils similar in every respect to those possessed by the farmers, who require to be convinced before they proceed to action. This caution on their part ought not to surprise us. The farmer is so often led into error by advice being given to him, without due regard being had to the difference of soil and climate, and without consideration of the demands of the market for his produce, that we may regard this very caution of his as in some degree a proof of practical wisdom. We will now state briefly a detail of the experiments in question. The field selected for trial was deeply ploughed at the end of the year. In spring it was divided into three parts, on two of which a good supply of manure was lightly ploughed in. At the time of sowing, one of these portions was sown broadcast in the usual manner; the other in drills, in the same manner as in Potato planting, namely, by placing the seed in every other furrow and covering it by means of the plough—a plan it was thought best to adopt as being the simpest that presents itself to the farmer who is not in possession of improved implements. The remaining part of the field on which no manure had been applied, was formed in high ridges, according to the Scotch method described by Low; and the Beans being sown in the hollows between the ridges, at a distance of about 24 English inches; the manure was placed upon the seed, and then covered in by a second plough, which passed through the middle of the ridges. In this manner the formation of the ridges, the sowing of the Beans, and the placing and covering in of the manure, were executed at one and the same time. It is truly to be regretted that improvement in cultivation requires in almost every case the employment of new implements, and consequently an outlay of capital, which, although repaid by increase of produce and economy of labour, is one of the causes of the repugnance felt by farmers at any innovations on old practices. The perfect and easy sowing on ridges in this case would have required the employment of a plough with a drill and double mould-board; but in order to confine the trial of this method within the ordinary limits of possibility, without incurring fresh expense, I made use of the ordinary plough, notwithstanding the difficulty of the good execution of work like that in question, particularly when the precaution is not taken of inclining the plough from the side opposite the mould-board, when covering in the furrows. The sowing of this third portion was executed by hand. A few days before the Beans came up, the whole of the three divisions of the field were equally harrowed. As soon as the plants were 4 inches out of the ground, hoeing was commenced, and was always executed in the same manner in the two drilled sections of the field. This operation ought to be repeated three or four times, with an interval of a few days between each, and always in a different direction; that is to say, taking care to turn the soil back to the stems of the plants, when, by a previous hoeing, it had been turned up in the middle of the interval between the rows. The implement indispensable for the good execution of these operations, is the horse-hoe of M. Omalius, with transposable shares. It works with the greatest facility, and earths up or exposes the plants at pleasure, according to the arrangement of the shares. The last earthing up, which is effected by a skim-hoe, adapted to this implement, ought to be executed before the first flowers of the Bean make their appearance, as the passage of the horse or implement might easily brush them away from the plant. Those weeds between the rows which have escaped the hoe may be removed by the hand. The extraordinary development of the stems and shoots soon raises the plant to a foot in height, the ground becoming covered in a short time with a thick shade, which maintains it in a state of suitable humidity during the remainder of the season. The reaping should be effected by the sickle, in order that the work may proceed row by row; as the employment of the scythe is rendered difficult, on account of the ridges. The following are the results obtained from the respective crops on the three divisions of the land submitted to trial:—

| | bush. | quarts. | |
|---|---|---|---|
| I. The first, sown broadcast, gave an ordinary return, but one which may be regarded as very satisfactory for the locality of Hesbaye ... ... ... ... | 25 | 19 | per English acre. |
| II. The second, sown in rows, as in Potato planting ... ... ... | 27 | 17 | do. do. |
| III. The third, drilled on ridges ... | 28 | 30 | do. do. |

We must add to each of the two last results, about $1\frac{2}{3}$ bushel, on account of the saving in using only half the quantity of seed for sowing. The amount in weight of the dry stalks is represented by the following figures:

1. Sown broadcast ... ... ... 22 cwt. 31 lbs.
2. Sown in rows ... ... ... 18 cwt. 25 lbs.
3. Drilled on ridges ... ... ... 19 cwt. 95 lbs.

It follows from these results, that the Beans sown in drills on ridges have an undisputed superiority in the

production of seed over those sown broadcast, and only an inconsiderable inferiority in the amount of straw. As to any fear which may be felt that the stems thus obtained will be unsuitable as food for cattle, on account of their too great development, we can assert such apprehension to be entirely groundless; our experience having proved, indeed, that animals reject no portion of them, although the fodder may appear to the eye as more gross and less inviting. We may conclude, on a consideration of these facts, that the cultivation of Beans in rows, according to the mode practised in Belgium, is by no means more advantageous than the cultivation on ridges; and it is therefore to this latter system that we wish to see the preference given. Besides the numerous advantages which attend it, there are in other respects exceedingly important consequences to be derived from it. Thus, for instance, the principal defect of this plant, even in soils best suited to it, is its liability to failure; and this tendency is such, that at the Hohenheim school in Germany, the seed produce of this crop varied in the course of five years from $10\frac{1}{30}$ to $37\frac{5}{7}$ bushels per English acre. The variable character of the Bean crop in Belgium is nearly as great as in Germany, but the causes are known to reside principally in drought and parasitic influence. Now this dryness is often combated with success by culture in rows, because the frequent workings given to the soil by the hoe, divide its particles, and obtain for it a greater degree of freshness. Garden culture also offers undoubted examples of the efficacy with which we resist, by frequent hoeings, the drying up of the soil; and the careful earthings which terminate the operations contribute at the same time in retaining the requisite humidity at the foot of the plant.

As to parasitic tendency, if the new system does not constitute a preservative, properly speaking, against that constant enemy of the Bean, it gives at least great chances of success in arresting, as we must suppose, its progress. We know that the plant is almost uniformly attacked at its top either by cryptogamous vegetation, commonly termed "rust" (mildew or blight), no doubt on account of its apparent resemblance to the rust or oxide of iron, which shows itself in the hot damp days of summer; or by a parasitic insect called the "collier," which generally makes its appearance at the same time as the rust fungus. It is to be remarked, too, that, in row culture, the flowers low down in the stem are those which principally bear the seed, because their blowing is favoured in the spring by the aeration given to the plants; while, in the broadcast system, these flowers are particularly liable to droop for want of due circulation of air. Now, as this scourge of the Bean plant occurs but rarely in the spring, the flowers which have blown at the lower part of the stem have set for seed by the end of that season, and two-thirds of the crop are accordingly saved before the ordinary epoch when the devastation begins. The facility also with which we can pass between the rows in fields sown in drills, allows easy access to the plants for the purpose of cutting off their tops, and thus diminishing in a great degree the ravages of the parasite. In broadcast culture, on the contrary, the farmer may fold his arms despairingly in the presence of a destruction, which is sometimes a total one, of his seed crop. When we take into account, too, the influence of drill cultivation on the succeeding crop, we shall find new reasons that plead in its favour. Thus the Wheat grown on the different divisions of the field which was the subject of our experiment, had a marked advantage in the two portions on which the Beans had been raised in rows, not only in quality of grain, but also in amount of produce; while the ridged portion maintained the same relative superiority in this respect as to Wheat, as it had done in the previous year in reference to Beans.

We shall terminate the enumeration of these motives of preference connected with drill cultivation by citing another not less important one, drawn from actual circumstances of the markets. For several years Bean-flour has been much sought after, and the price it has fetched has accordingly kept steadily above that offered for Rye-flour. This article of provision, therefore, being now an easy and advantageous object of sale, it is on that account important to draw attention to the means of increasing its production. Do we mean to say, it may be asked, that we recommend, without restriction, the transformation of the Bean crop, at present intended for consumption on the farm into a provision of sale, without attending at the same time to the necessity of introducing modifications of culture into the land, and of supplying the deficiency that must ensue in the production of manure? We reply: certainly not; but that if the farmer increases at the same time the production of substances proper for the food of cattle, which he can easily do by resorting to the cultivation of root crops on improved systems, we believe that the destination of the Beans for sale cannot occasion any injury to the general economy of the farm. *Journal Agricole de Verviers.*

## Home Correspondence.

*Feeding Cattle.*—Such a mild winter as the last is not recorded in the annals of agriculture since the year 1826. And the result in one respect has been highly beneficial to the generality of farmers in all districts, but more especially on the Scottish border, by causing an unexpected increase in the growth of Turnips, and counteracting in many cases the anticipations of an inferior crop. Stock of every kind has been thriving this season uncommonly well, attributable principally to the warmth so essentially necessary for the rapid improvement of their condition. I have observed that those animals fed in the open yards, have surpassed those fed in boxes, which, in my opinion, is, to a certain extent, a proof of the principle upon which Mr. Warnes recommends box-feeding, although in an opposite manner; the probable reason of the success of the open shed this year will enable us to draw a practical inference. First, then, keep beasts ever so well ventilated in the boxes, they still sweat and blow, and when they have filled their stomachs, instead of lying and quietly ruminating their food, they have appeared uneasy, and continually getting up and down, whereas, in the open yard, they are almost invariably settled, and sufficiently cool to digest their food comfortably. I am, for the sake of argument, supposing them to all feed alike. Now, most of those who have any experience on the subject, are of opinion that box-feeding is decidedly the most profitable, and in previous years have brought them quickest to perfection. From the present exception (which may never occur again in our lifetime), we see practically proved by the old plan what has been advocated by the supporters of the new system—viz., that excess of warmth is more prejudicial than even the opposite extreme; an overplus of food is required to make amends for loss of animal matter in the shape of perspiration, and more rapid respiration; now in the usual run of seasons, the same principle applies to the opposite extreme, for an overplus of food is then required to sustain sufficient animal heat to exclude the absorption by the skin and lungs of this generally cold and humid atmosphere, then again in frosty weather we all know cattle in the open yard thrive better than in warmer and wet weather. Why? because they have only one opponent to contend with instead of two.—only the temperature of a cold atmosphere instead of a cold and wet one. In the northern counties many practical men have expressed their opinion, when questioned on the subject, as follows: that they are perfectly of opinion, "that box feeding with a regular moderate temperature is a saving of food, and a rapid mode of bringing cattle to the market." On the other hand they object to them as not putting down into manure a sufficient bulk of straw, and as requiring a considerable outlay of money to erect the necessary buildings even on the cheapest principle. To the first of these objections I would say there is an increased value on the manure far surpassing a larger quantity of wet straw, and that the overplus of straw might be mixed in my opinion very advantageously with compounds of soil, mud, &c., and amply repay the extra labour. The second objection is a matter between landlord and tenant, and I am sorry to say too frequently the landlords either leave the tenant to erect buildings at his own expense, or else insist upon raising costly buildings for appearances sake and little utility, requiring a heavy per centage from the tenant, leaving him disgusted with boxes and box feeding. *E. B. H.*

*Produce of Cows.*—I noticed in your paper of the 10th inst. a communication from my man, respecting a cow of mine, and take the liberty of saying that you do not do justice to the subject, inasmuch as the article of your correspondent, on the production of cows, was as far back as March 29, since which the Grass has made its appearance in abundance, causing a wide difference in the production of cows. I think you should have inserted his letter in your next paper, viz., April 5th, and then your readers would see the comparison clearly. *John Storold.* [You are right: but it is not possible sometimes to give immediate insertion to communications].

*Bed and Alley.*—In the system practised by Mr. Smith, the "bed and alley" occupy a width of 5 feet, and there are 3 rows of Wheat sown on each bed, at a foot apart, therefore it is 2 feet from the outside row to the other; yet I consider that the 3 rows occupy a width of 3 feet out of the 5; 6 inches on the outside of each outside row should be reckoned as cropped. For instance,—was the whole of the ground sown, there would be room for only 2 additional rows in each alley; therefore, instead of half of the ground being cropped, it must be three-fifths; and if three-fifths, instead of Mr. Smith's crop having produced between 8 and 9 quarters per acre, supposing the whole to have been sown, it must have been between 7 and 8 quarters per acre, or 4 quarters and 2 bushels off three-fifths of an acre. *Wm. Griffin, Eydon, Daventry.* [Will you not give us your experience of the "Penny Savings Bank," alluded to last week.]

*Tullian Growth of Wheat: A Word in Season.*—Many of your readers will recall the correspondence that has lately appeared in the *Gazette* on the Tullian theory of growing Wheat year after year upon the same land, and without manure, simply by means of preparatory deep trenching and annually digging between the rows of the growing Wheat. There is so much in the principle this involves that is opposed to the general ideas as to the importance of manure, and at the same time so much is to be gained in our practice, if it be true that by improved cultivation the occasion for manure for growing corn may be lessened, that I am watching with great interest the progress of the seventh crop of Wheat so sown, which the author of "A Word in Season" has now growing, and it was with much pleasure I read the following letter from him:—"Vicarage, Lois Weedon, Towcester, April 29.—My dear Sir: You have taken so much interest in my farming operations, that you will be glad, though not surprised, to hear that my 4 acre field of Wheat, which you saw in the winter, is attracting astonishment. It is certainly the most beautiful growing crop I ever beheld; it has all the fine qualities we look for at this season, even all over the land, and not varying an inch in healthy colour." This report of the Wheat I was fully prepared to hear, from the fine appearance I saw it presented in the winter; and now let me ask what more can be said of any crop, that has had a preparation and a seeding at treble the cost? This instance of what may be done by tillage, without manure, to grow grain with much less than the usual charges, I regard as most worthy of attention. Not, as I have before said, as an example to be precisely copied by farmers, but as showing the benefit to be gained from deep tillage and fine comminution of the soil between the growing crop; a lesson which an intelligent farmer would read to apply to trench ploughing his land, and hoeing and scarifying the ground between his young corn. The Hop grower adopts the practice between his Hops; in the spring of the year he turns over the ground with a fork, and breaks up the surface between the rows with his nidget, and he will tell you the practice is necessary to ensure a healthy and luxuriant growth, and the scuffling plough and scarifier have long been introduced between the rows of Beans and Peas, and roots on the best cultivated farms in Scotland, and the north, with great advantage to the growing crops, and still more to those that follow; and what is there to prevent a general extension of the practice to Wheat, Oats, and Barley, now that we have Garrett's horse-hoe, which, at a cost of less than 1*s.* an acre, enables the farmer to perfectly hoe all corn drilled as close as 9 inches. In instancing this narrow width, I am far from thinking it so successful as much wider. I have long since abandoned anything nigher than a foot, and am still getting wider; I have Oats and Barley at 21 inches, so as to admit the scuffling plough passing between the rows, and expect I shall find this width near enough; and how can I think otherwise, when I find Tull in ruder times could grow 4 quarters of Wheat an acre, year after year, from double rows, with 4 feet intervals, and without manure; and I see Mr. Smith realizing 33 bushels an acre yearly, from three rows upon 5 feet beds, and also without manure; and I will appeal to farmers holding only arable land, whose accounts have been so kept that their stock shows its cost and the expenditure and loss upon it, whether a practice which lessens the occasion for manure and for keeping of stock be not a desideratum in corn growing, of the greatest importance. The lessons we have had in shed-feeding, &c., are of the greatest value in teaching us how to raise manure at least cost, but the most valuable lessons of all will be those which shall teach farmers to do with less manure. Now that we have learnt how to raise manure, let us see if we cannot improve our tillage, so as to make it go very much farther. The cost of manure raised at home is far greater, and has far more to do with the profit and loss to be made in farming, than many are aware of. *Hewitt Davis,* 3, *Frederick's-place, Old Jewry.*

*Game.*—Will the Rev. George Wilkins have the goodness to answer the following questions: 1st, Who does he consider is the master on the farm, where game is preserved? 2d, How much does a hare or rabbit cost the landlord? 3d, How much the tenant? 8th, What effect on the county rates if the Game-laws were abolished? 9th, How is it that when a large landed proprietor takes to farming himself, he always does away with the game preserves? 10th, Would it not be better for a landlord to let each of his tenants preserve his own game, and do away with that most obnoxious person—the keeper; who is the cause of all bitter strife between the landlord and tenant? I am sure that the farmer would not totally destroy his best friends, the winged game, as they live upon his enemies. *James Cuthill, Camberwell, London.* [Questions 4, 5, 6, and 7, on the relation of the Game-laws to crime, have been omitted. We wish to confine our correspondents to the purely agricultural aspect of the subject.]

*Deep Draining.*—Will Mr. G. Wilkins, whose communication on open furrows appeared in the *Journal* of May 17th, be kind enough, in a few brief unscientific sentences, to set a common-going farmer right, who should thus address him:—"I occupy land of all degrees of stiffness; some very stiff, some a jointy, brashy, mixed kind; and some half clay, half sand, or, at least, partaking of the character of the two. I am hurt by the water from the clouds, which does not get readily off. Drains cut just out of the reach of the plough-share, or the poaching of a horse's hoof, would surely catch it sooner than a drain from 3 to 5 feet deep, and in addition to this, how is it to get so low through a stiff subsoil in time to do me good, for as soon as the stiff earth, which is thrown back into the drains, becomes solid, and closes on the tiles so forcibly as even—according to a late correspondent—to break their backs, it seems to me that they might just as well be at the Antipodes. Why is it so generally recommended to fill up the drains with loose, penetrable, rubbishy stuff, that the water may more readily get down to the pipes? If so, why go to such a depth at all?" This is a commonplace expression of the notions of hundreds of owners, and occupiers, and, though I doubt not, the point has been often treated of, perhaps Mr. Wilkins would once again clear the matter up, and, I am sure the kind indulgence of the *Agricultural Gazette* will lend its columns to the elucidation; and either much prejudice will be dissipated, or it will be acknowledged that there is a just medium between the two extremes. *An Inquirer.*

*The Acre.*—In answer to your enquiries as to the rod, pole, or perch in this country, I have to inform you

that we have two local measurements in common use here, namely,—the Cheshire and Lancashire, the latter appearing to be the same as the Irish, as quoted in your letter. I give you below the measurements of the statute, Cheshire, and Lancashire perches, and also an extract from a table published many years ago by a land-surveyor of this town, equalising the three measurements. *Lawrence Walker, Stockport; to Mr. Abraham Hardy.* One statute perch contains 30¼ square yards; 1 Cheshire, 64 square yards; 1 Lancashire, 49 square yards. One statute acre contains 4840 square yards; in Cheshire measurement 1 r. 35.625 p.; and in Lancashire measurement, 2r. 18.7755p. One Cheshire acre contains 10,240 square yards; in statute measurement, 2 a. 0 r. 18.5123 p.; and in Lancashire measurement, 1a. 1r. 8.9795p.* One Lancashire acre contains 7840 square yards; in statute measurement, 1 a. 2 r. 19.1735 p.; and in Cheshire measurement, 0a. 3r. 2.5 p.——At your request we have made enquiries for the number of square yards in a rod, pole, or perch, and also of an acre in Cheshire and Lancashire, and have received the above detailed reply: from which it appears that the Cheshire square measure is—64 square yards are 1 rod, pole, or perch; or 10,240 square yards are 1 acre; and the Lancashire square measure is—49 square yards are 1 rod, pole, or perch; or 7840 square yards are one acre. *Hardy & Son, Maldon, Essex.*—— Land measure here in Berwickshire is the same as in England. The old Scotch acre is now out of use; it is sometimes, but seldom, used in the Lothians. Five English acres make nearly 4 Scotch, which, I believe, contains 6104⅛ yards. *Wm. Nicholson; to Mr. Hardy, Maldon, Essex.*

## Farmers' Clubs.

STOCKTON DISTRICT, *May 7*: The above club held their first meeting for discussion. The subject was—*The Cultivation and Management of the Turnip Crop.*

Mr. PARRINGTON remarked that he considered the subject an appropriate one for the season, and the meeting to-day afforded those present an opportunity of inquiring of each other the best way of getting a crop, which every one would allow was essential to the farmer. In this district we laboured under great disadvantages from the difficulty of thoroughly preparing strong clay land for Turnips. The first step to be taken is to drain land thoroughly. He would not discuss the merits of this or that system of draining (that would afford a subject for future discussion), he would merely say the land should be thoroughly drained. In this county Turnips generally followed a grain crop. The plan he adopted, and which he recommended to the consideration of all the farmers present, was to clean the land well in autumn; there was no plan so cheap and effectual as this. One man, with a fork, followed by three women, can do a great deal in a day, and by this process you have two-thirds less weeds to eradicate than by cleaning in the spring. You cannot plough land too deep for Turnips; it should be ploughed not later than November, and not less than 9 inches deep. He did not consider it advisable where land had only been ploughed 4 inches, to plough it at once 9 inches, but gradually to deepen the soil, bringing a small portion of the subsoil to the action of the atmosphere at a time. Having ploughed your land in the autumn, you should not begin with it in the spring until you are certain you can have all complete and ready for sowing, for if you get your land prepared and it come rain, strong clay will run together, and your labour is lost. He thought no manure was so good as farm-yard manure for Turnips. He applied to his Turnip crop 2 cwt. of guano and 12 loads of farm-yard manure per acre; and pumped the contents of his liquid manure tank upon his manure heap once a week; and when the heap was ready for the Turnips it cut like soap. Every farmer should have a liquid manure tank, as it would save him much trouble, and much valuable manure. In sowing your Turnips, it is a good plan to have 15 or 20 rows prepared at night, and your force and plough ready for the following day. It is not desirable to begin to hoe too soon; some prefer to hand-pick the Turnips before hoeing, but he did not think it necessary. The horse-hoe should be kept going two or three times; and the land should be gone over, according to the inclination of the land to throw up weeds. The Turnips will be ready for pulling off about November, when they should be stored in pits covered with the tops, and above that a depth of soil to keep them from the wind. The seed he used had been grown on his own farm, and had been grown by his father for 50 years. He produced two specimens of very fine bulbs grown from the seed alluded to.—Mr. DYKE said he had used the same seed procured from Mr. Parrington, and had Turnips from it equal in size and weight to those upon the table.—The Rev. S. H. DYKE coincided with most of the opinions expressed by Mr. Parrington, and thought that good plucking was necessary to the proper cultivation of the land for Turnips; and was glad to find, from the specimens which he had witnessed at the late ploughing-match, held under the auspices of this Club, that we had many good ploughmen in the district. The work of the men was very good, but that of the boys' class was excellent. He was glad the Club had supported such meetings for ploughing and other work, and hoped it would continue to do so. He thought it impossible to get a good crop by shallow ploughing. When he came from the south, farmers used to boast of ploughing 1½ acre a day; if they could have boasted of doing half an acre well, it would have been better. No land should be ploughed less than 7 inches for Turnips; and many thought it sufficient to plough in spring, but he was of opinion that land for Turnips should always be ploughed in November. He manured his Turnips with 12 loads of good farm-yard manure (his stock being fed on Linseed, Bean-meal, and Turnips), and 2 cwt. of guano; but differed from Mr. Parrington in the time of putting the liquid manure upon the heap; and thought, that if put on periodically, it soaked through, and much was lost; he therefore preferred pouring it on the heap a day before it was wanted for the Turnips. Many persons objected to storing Turnips against a stone-wall, but he considered that the main point was to exclude the air, as he had himself stored some against a stone-wall, which were as sound, and many as heavy as the specimens upon the table. His dung heap was covered with linseed-straw, and covered that again with rotten manure, and his Turnips were now quite sound, and would, he expected, keep some time longer. He considered that many crops were lost from the seed being bad, as persons did not always consider the kind they had got, and when they had bad crops it was attributed to the land; but he would recommend every farmer to grow his own seed. He thought that it was sufficient to leave the plants in singling 10 inches apart. Some persons say you ought not to hoe Turnips in dry weather, as you let the drought in, but he differed from this altogether. When it can be done, it is very advantageous to feed off your Turnips by sheep on those clay soils, and would be very desirable. Mr. Graham, who was present to-day, had a field at Wynyard, which he fed off, strong clay. The sheep were driven to the pasture in wet weather, but were taken back when the weather permitted.—Mr. HARRISON, of Ormesby, did not agree with Mr. Dyke about eating on the land, as he thought it would be unprofitable. He had a relative in the Wolds, who, 20 years ago, never drew a Turnip; he has now began to draw some, and by adding a little light manure he g ts equal crops, and has his manure for other purposes.—Mr. DYKE stated that Mr. John Parrington, of Sockburn, had a field which he manured in the autumn, and had an excellent crop.—Mr. S. PARRINGTON said his brother had a good crop, but he did not find the system answer as a general rule.—Mr. FAWCETT, of Ormesby, did not approve of Mr. Parrington's system of cleaning the land, but adopted the following plan:—He put on a skimmer, and skimmed 4 inches deep; then dragged across the skimmer, then harrowed after that. He used the clod-crusher, and then used the scarifier again; also mixed ashes with his guano, and ploughed 4 inches deeper, and then it the land was not clean, he repeated the above process. He had an excellent crop of Turnips. The drag he used would drag 8 acres a day; the skimmer would do 5 acres.—Mr. PARRINGTON said Mr. Fawcett's farm, when he went to it, was covered with weeds. Mr. Fawcett, by this process, had done a great deal toward cleaning the land, but his remarks referred to those cases where the land was in a usual state of cultivation, and where the weeds were comparatively few.

METEOROLOGICAL REPORT.—MAY.

* † ‡ Notwithstanding the steadiness of the barometer and the fineness of the weather, I anticipate it will be found that to the westward there has been heavy weather (probably from thunderstorms).

§ In this case the wind having sprung up from exactly the opposite point of the compass, the barometer began to give way from the storm approaching, and our being on the eastern verge of it. This storm came from the westward (and probably from the West Indies), and crossed to the eastward. A remarkably brilliant sunset on the 25th.

S.L.—This change of wind, with settled weather and a barometer steadily rising, is very unusual; it would arise from the storm curving suddenly to the northward, whilst over these islands.

Dorchester, May 29th. *F. P. B. M.*

(*To be continued.*)

## Miscellaneous.

*New Source for the Supply of Guano.*—We understand that information has been received at the Colonial Office, that a discovery has been made of very extensive deposits of guano on the coast of Western Australia, to the north-east of Swan River. Hitherto this coast has been very imperfectly surveyed, but this discovery will, no doubt, lead to a careful examination of it, and of the bays and passages by which it can most easily be approached. Lord Grey takes too lively an interest in all that tends to promote the advancement of the material and industrial interests of our colonies to permit such a source of wealth, both to the colony and the mother country, to remain undeveloped. It is understood that several vessels have already carried cargoes of this guano to the Mauritius, and that the quality is fully equal to that which was derived from Ichaboe. *Economist.*

## Notices to Correspondents.

BONES AND ACID: *Iago* will be both chemically and agriculturally right in mixing them with charcoal.

DUNG AND LIME: *J T W.* It is not economical to place lime near dung in the land, because, in the presence of lime, ammonia at once assumes the volatile form, and may be lost. In adhesive soils, however, which have the power of retaining ammonia, there may practically be no mischief arising from a practice which strictly is incorrect.

FARMERS' FOWLS: *T* has addressed us in a letter, bearing the Liverpool post-mark to this effect:—"A leading article some time since patronised the silver-spangled Hamburghs [this is inaccurate; the golden-pencilled were mentioned] or the cuckoo fowls, and now a reviewer speaks of getting 'back to Dorkings and common sense.'.....I would suggest that the poultry critic of the *Agricultural Gazette* should adopt a breed for the farm-yard without any *ors*, and stick by it until the time arrives for him to announce the *fact*, that another breed will be found more profitable, and the particulars which make it so." This is a very acute observation, and therefore, to follow it up, we will in future recommend one breed of cattle, and one breed of sheep indiscriminately for all farmers in the kingdom. The Durhams, say, shall be recommended not only to the lands where they now are, but to take the place of the Galloways on the Argyleshire mountains, and of the Herefords before a Norfolk plough. The Leicesters do exceedingly well in many parts of England: we will stick by *them*, and have no *ors*, but send them to the next Cheviot-hill farmer who asks our opinion. No doubt the *Gardeners' Chronicle* will embrace a like principle, and advise the same varieties and species of flowers and culinary vegetables to be grown in Devonshire and in Northumberland, in the Isle of Dogs and on the Cumberland Hills. It will save a deal of trouble. But our friend "T." will kindly again read over the leading article which he (incorrectly) quotes. He will obligingly peruse the little sentence, "The advice given must be accommodated to what the farmer *wants*," and those which follow; and we then answer his question, "What is the *best* breed of fowls for the farmer to adopt, the object being plenty of eggs, chickens, and good fowls for the table?" Try the cuckoo fowls, *or* the Surrey, *or* the Dorking, *or* the Cochin China. Any of them *may* suit you; *which* is probably the best *for you* we cannot say, as you give us no opportunity of viewing the locality of your poultry-yard. *Perhaps* a good stock of game fowls (the black-breasted red, *or* the duck-winged), may thrive in your situation better than any of the aforesaid candidates for your favour. At any rate, hold to your resolution to keep but *one* breed, and that pure.—Our correspondent will perceive from this comparison that he has altogether overlooked the grounds on which variety of recommendation is unavoidable.

FORTY-DAY MAIZE: *A Subscriber.* If you have a very hot summer, you may ripen the seed, but you cannot be sure of it.

LIQUID MANURE PUMPS: *Constant Reader.* Apply to Read, of Regent Circus, London.

MANGOLD WURZEL: *A B.* The manure should be, as I have already explained, deposited first in the holes, for making which a dibble, about 3½ feet long, and shod with iron, is the best: distance apart, 27 by 14 inches. The seed, two or three at a time, is then lightly pressed on the manure, and the hole covered up; the seed should not be deeply buried. The superphosphate, if used, must be mixed with plenty of ashes, or better still the scourings of drains, and peat earth, as without this addition the superphosphate alone would burn up the seed and be useless. Half a pint of manure will be found ample; having tried both a pint and a half pint. The former I found more than necessary. *H. E.*

MR. PAINE'S PORTABLE RAILWAY: *W Edwards.* The portable farm railway is made of the best yellow deal; the inner edges upon which the trucks run being shod with thin iron. The rails are socketed together, and are held fast by an iron clamp; they are made in lengths of 15 feet, and are easily carried by a couple of men or lads. The rails are held firmly together by the transverse pieces or sleepers on which they rest and are fitted into. Mr. Crosskill charges 2*s.* 6*d.* per yard, therefore every 100 yards will cost 12*l.* 10*s.*; but this charge does not include the cost of trucks, sidings, turn-tables, &c., which is, of course, dependent upon the requirements of the purchaser. I have pointed out some improvements in the form of the turn-tables, crossing of public roads, &c., to Mr. Crosskill, which he has adopted. The rails are easily repaired, and, indeed, can be made by any common carpenter; but I doubt whether much saving can be effected, seeing that Crosskill does so much work by machinery. When not in use, this railway ought to be carefully packed away; I have been compelled to build up a shed on purpose, mine being a long one. *J. M. Paine.*

PROFESSOR HENSLOW'S BARLEY EXPERIMENT: *To our Readers.* We should be glad to know the addresses of any who may have thought of leaving a part of their Clover seeding unseeded with Barley, as suggested by Professor Henslow, to determine the effect, if any, upon the future Clover crop.

RED MANGE: *Barkley.* It is not the effect of the acari insect. It is sometimes incurable. A lotion composed of pyroligneous acid, 1 oz.; water, 1 pint, may be tried; and if it fail, mercurial ointment. *W. C. S.*

## Markets.

COVENT GARDEN, MAY 31.

Trade is somewhat brisker. Peaches, Nectarines, and Cherries may be obtained; the former at from 12s. to 20s. per dozen, and the latter at from 6s. to 12s. per pound. Hothouse Grapes are plentiful and cheap. Pine-apples are more abundant. The same remark applies to Strawberries. Dessert Apples chiefly consist of American Newtown Pippins. Oranges and Lemons are plentiful. Nuts remain nearly the same as last week. Vegetables of all kinds are abundant. Asparagus, young Carrots, French Beans, and Green Peas are still received from France, Cucumbers from Holland, and considerable quantities of Potatoes and Asparagus from Cornwall, as well as green Gooseberries. New Potatoes may be obtained at from 2d. to 6d. per pound; old kinds realise high prices. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1s. 3d. per pottle. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Double Primroses, Stephanotis floribunda, Cinerarias, Moss and Provins Roses.

FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 8s to 12s | Oranges, per doz., 9d to 2s |
| Grapes, hothouse, p.lb., 5s to 10s | — per 100, 6s to 14s |
| — Portugal, p.lb., 1s to 2s 6d | — Seville, p. 100, 7s to 14s |
| Strawberries, per oz., 6d to 1s | — — p. doz., 1s to 2s 6d |
| Pears, per doz., 2s to 5s | Chestnuts, per peck, 2s to 5s |
| Apples, dessert, p.bush., 6s to 10s | — per 100, 9d to 1s 6d |
| — kitchen do., 5s to 8s | Nuts, Barcelona, p.bsh, 20s to 22s |
| Almonds, per peck, 6s | — Brazil, p, bsh., 12s to 14s |
| — sweet, per lb., 2s to 3s | Cobs, per 100 lbs., 50s to 55s |
| Lemons, per doz., 1s to 2s | |

VEGETABLES.

| | |
|---|---|

end Hetton, 15s.; Wallsend Laudton, 14s. 6d.; Wallsend Stewarts, 15s.; Wallsend Tees, 15s.—Ships at market, 173.

POTATOES.—Southwark, May 26.

The Committee report that the market continues to be well supplied both coastwise and by rail. Trade was very heavy, and, with every description of Potato, prices had a downward tendency. Coarse second-rate samples were nearly unsaleable at any figure. The following are this day's quotations:—York Regents, per ton, 60s. to 90s.; Scotch do., 60s. to 75s.; ditto Cups, 65s. to 80s.; Catholics and whites, 45s. to 55s.; Cambridge whites, 45s. to 70s.

SMITHFIELD, Monday, May 26.

We have a few more Beasts than on Monday last, but the demand having increased, we are enabled to retain that day's quotations. There is a much larger supply of Sheep and Lambs, and on the average trade is not so good as on Monday, but rather better than on Friday last. It is difficult to effect a clearance. Good Calves are not plentiful, and are sold rather dearer. From Holland and Germany there are 435 Beasts, 1340 Sheep, 144 Calves, and 18 Pigs; from Norfolk and Suffolk, 2400 Beasts; and from Scotland, 300.

| Per st. of 8 lbs.— | s | d | s | d | Per st. of 8 lbs.— | s | d | s | d |

| Best Scots, Herefords, &c. | 3 | 4 | to 3 | 6 | Best Long-wools | ... | | | |
| Best Short-horns | 3 | 2 | — 3 | 4 | Ditto Shorn | 3 | 4 | to 3 | 8 |
| 2d quality Beasts | 2 | 6 | — 3 | 0 | Ewes & 2d quality | ... | | | |
| Best Downs and Half-breds | ... | | ... | | Ditto Shorn | 2 | 6 | — 3 | 2 |
| Ditto Shorn | 3 | 8 | — 4 | 0 | Lambs | 5 | 0 | — 6 | 0 |
| | | | | | Calves | 3 | 0 | — 4 | 4 |
| | | | | | Pigs | 2 | 8 | — 4 | 0 |

Beasts, 3835; Sheep and Lambs, 27,070; Calves, 247; Pigs, 490.

Friday, May 30.

The supply of Beasts is small; they are readily disposed of at fully Monday's rates. In a few instances a small, but not a quotable advance is realised. The number of Sheep and Lambs is large; however, there is a fair demand; the former maintain late rates, but there is a small reduction in price of the latter. Trade is very dull for Calves, and 4s. is rarely exceeded. From Germany and Holland we have 48 Beasts, 720 Sheep, and 218 Calves; from Spain, 210 Sheep; from Scotland, 100 Beasts; from Norfolk and Suffolk, 400; from France, 6 Beasts and 48 Pigs; and 108 milch cows from the home counties.

| | | | | | | | | | |

Beasts, 734; Sheep and Lambs, 11,560; Calves, 484; Pigs, 495.

MARK LANE.

Monday, May 26.—The supply of English Wheat to this morning's market was small, and an attempt was made to establish a slight advance in price, which, however, was only successful in a few instances, the bulk of the arrival realising last week's prices. The receipts of foreign Wheat have not been large this week, but French Flour continues to come to hand too freely to admit of any advance in price. Barley was fully as dear as last week. The receipts of Oats since this day se'nnight amount to upwards of 23,000 qrs.; the demand, however, being large, factors were enabled to obtain an improvement of 6d. per qr. upon the rates of Monday last.—Beans and Peas fully maintained former prices.

Friday, May 30.—The arrivals of English Wheat this week amount to only 2950 qrs.; whilst from abroad we have received 7580 qrs. of Wheat, and 6560 sacks of Flour. The trade was firm this morning, and Monday's quotations were well supported. Our market was attended by several country millers from a distance, who purchased secondary and inferior sorts of Wheat at full prices. Choice marks of French Flour were in request, with the turn in price against the buyer. Inferior sorts continue very unsaleable. Barley, Oats, Beans, and Peas in short supply, and prices of all have an upward tendency.

Liverpool, Tuesday, May 27.—The arrivals from foreign ports are upon a very moderate scale, notwithstanding that favourable winds have prevailed throughout the week. There was a good attendance of buyers at this day's market. Good fresh parcels of Wheat were disposed of to a fair extent, at quite as good prices as last week, but old and secondary qualities were neglected; approved brands of Flour supported late rates; in a few instances American barrels gave way 6d. Indian Corn declined 9d. to 1s. per qr. from last Tuesday, at which a few parcels changed hands, and the market closed with rather more firmness. The supply of Oats was beyond the demand, and the few sales made were at a reduction of ½d. to 1d. per bushel. Oatmeal was not lower, nor was there any change in the value of Barley, Beans, or Peas. —— Friday, May 28.—This morning's market was fairly attended. The demand for Wheat was moderate, but there was no perceptible change in Tuesday's quotations for any sort. Flour was rather easier to purchase, and in some instances American barrels were 6d. lower. To get on with Indian Corn from the ship a decline of 6d. to 9d. per qr. was submitted to. Oats were ½d. per bushel lower, leaving the top value of the best Irish at 38s. per 45 lbs. Oatmeal was not any cheaper, nor was there any change in the value of Barley, Beans, and Peas.

| 12 " " 15 " " 70 " 85 " | ..... | 1 0 | 1 2 |

*Packed in boxes of 50 feet each.*

6 by 4 in. and 6½ by 4½ in., 12s. per box; 7 by 5 in. and 7½ by 5½ in. 13s. 6d. do.; 8 by 6 in. and 8½ by 6½ in. 15s. do.; 9 by 7 in., 9½ by 7½ in., and 10 by 8 in., 16s. 6d.

*N.B.—The Patent Rough Plate, one-eighth of an inch thick, is supplied in quantities 62 by 18 inches, for 10 feet span ridge and furrow roofs, at a reduced price.*

Note.—Squares are charged according to the superficial contents, except where the length exceeds the restriction above, in which case the higher price is charged irrespective of the contents.

*Bending.—1-8th, 6d.; 3-16ths, 9d.; ¼ inch, 1s. per foot, net.*

*Irregular shapes are charged as squares.*

*When Crates are ordered, the 30-inch widths will be sent, unless otherwise specified.*

THE PATENT ROUGH PLATE, one-eighth of an inch thick, and weighing 2 lbs. to the foot, has now become an article of very extensive and increasing consumption.

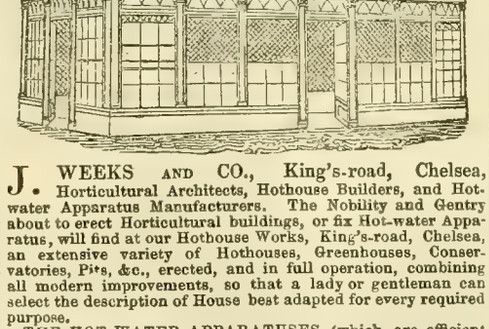
*It is universally admitted to be the best and most suitable Glass for Ridge and Furrow Roofs, Greenhouses, Factories, Workshops,*

And all such like purposes, and is a cheap and efficient substitute for Fluted or Obscured Glass, where the object is to intercept the vision without diminishing the light. Its non-transparency, strength, and cost (being no more weight for weight than Common Sheet Glass), render it eminently suitable for the Glazing of Conservatories and Roofs of all kinds; Blinds are unnecessary, and when used in Greenhouses *no scorching occurs.*

Where still greater strength is required the 3-16ths and ¼ inch thick will be found much cheaper than the Common Rough Plate. Samples will be forwarded on application, by applying to

JAMES PHILLIPS & CO., HORTICULTURAL GLASS MERCHANTS, 116, BISHOPSGATE-STREET WITHOUT, LONDON.

HORTICULTURAL BUILDING AND HEATING BY HOT-WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY and ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which for elegance of design, good materials and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP, AT THE LOWEST POSSIBLE PRICES.

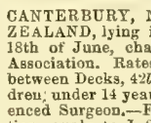
J. WEEKS and CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. Weeks and Co., King's-road, Chelsea, London.

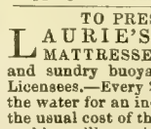
EXHIBITION GOLD PENS.—Superior Gold Pens, 2s. 6d. each; ditto, extra fine, 3s. 6d. each; ditto, best manufactured, same as sent to the Exhibition, 5s. each. Sent post free on receipt of Post-office order or postage stamps for the amount.—Address Messrs. Lindsey and Co., Pen Manufacturers, Birmingham.—*** A liberal Discount to the Trade.



BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S-ROAD, CHELSEA.

E. DENCH having erected Two Patent Hothouses at the west end of the Great Exhibition, invites the attention of Gentlemen to the superior qualities, with the lowness of price, attending the erection of his Patent Houses; and having now ready for sale FIVE HOUSES of different sizes and descriptions on his premises, and some of them at a great reduction in the price, thinking of making alterations on his premises.



Hothouses built to be Glazed without Putty for Wood, and warranted not to drip under any circumstances.

Heating with Hot-water on the most scientific and economical principles.

TO BOTANISTS, &c.

MR. SAMUEL STEVENS, NATURAL HISTORY and BOTANICAL AGENT, begs to announce that he is favoured with instructions to dispose of the very choice, valuable, and extensive HERBARIUM of the late GEORGE GARDNER, Esq., Director of the Royal Botanic Garden, Peradenia, Ceylon. This collection, which is presumed to contain upwards of 12,000 species, and about 14 000 specimens of Phænogamous Plants and Ferns, is beautifully arranged and in the finest condition, and, as far as possible, named, and with the greatest care. It is particularly rich in Brazilian and Ceylon plants, gathered mostly by himself during 5½ years' travels in the former country, and 4 years' residence in the latter, and are the authority for his many published species. It further includes numerous plants from Mauritius, the Neilgherries, Malacca, Hong-Kong, South Europe, and from various parts of the world, and altogether forms one of the finest Herbariums ever offered for sale. The plants may be inspected, and further particulars obtained by applying to Mr. S. STEVENS, 24, Bloomsbury-street, London.—Mr. S. S. has also on sale several sets of Dried Plants from Texas, New Mexico, Chagres, South Africa, New Holland, &c.; and large collections of Insects of all orders from the Amazon, Brazils, and other parts of South America; also from Africa, New Holland, India, South Europe, Madeira, &c.; Bird and Animal Skins, Shells, Reptiles, &c., &c.

---

FOR PUBLIC SALE, at the New Corn Exchange Tavern, Mark-lane, on MONDAY, June 2, at 2 o'clock precisely, by order of Messrs. Antony Gibbs and Sons, the Importers, 500 Tons, more or less, damaged PERUVIAN GUANO.—Catalogues, and further particulars, in due time, from J. A. RUCKER and BENCRAFT, Brokers, 26, Commercial Sale Rooms.

---

TO BE DISPOSED OF, with immediate possession, or in Autumn, an old Established NURSERY and FRUIT GROUND, the proprietor retiring from business. It is situated in a populous neighbourhood, six miles from London; the ground is unrivalled for Trees and Shrubs, also for producing the finest Fruit.—For particulars apply to J. C. HARDY, Esq., National Guardian Assurance Society, 19, Moorgate-street, London.

---

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

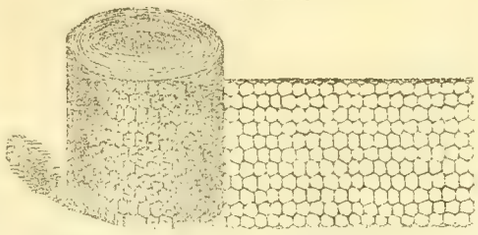
---

TO GARDENERS AND OTHERS SEEKING A CHEAP CONCERN.

TO BE LET, within four miles north of London, with immediate possession, a COTTAGE, containing four Rooms, with a Garden, where a good ready-money Plant business has been done, and which may be improved. The Show and Propagating Houses, and two Greenhouses, to be taken at a valuation. Rent, including taxes, 18*l.* per annum. Apply to Mr. GEORGE RUTHERFORD, Brook-street, Upper Clapton, near London.

---

A GOOD OPPORTUNITY.



TO BE LET, an Established SEED BUSINESS, doing a good Trade in Seeds, Plants, and Dutch Bulbs; stands well for jobbing work, being situated in the main thoroughfare of a densely populous neighbourhood. The above consists of a large showy Shop and four rooms. Rent and taxes, 20*l.* Coming-in for stock, fixtures, &c., only 25*l.* Three-quarters of an acre of ground may be had, if required: rent, 3*l.*—Apply to J. SEAWARD, London-st., Greenwich, Kent.

---

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.

---

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT-STREET, WESTMINSTER, LONDON;
48, NORTH-BRIDGE, EDINBURGH;
32, ST. ENOCH-SQUARE, GLASGOW:
1, CASTLE-BUILDINGS, DERBY-SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

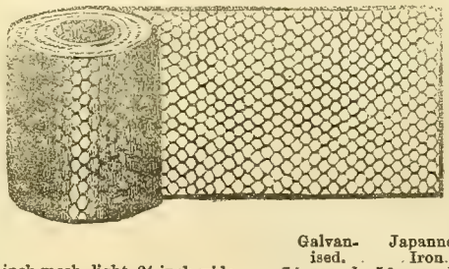
The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30*s.* ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

| | | | |
|---|---|---|---|
| Or a web of 100 yards, 18 ins. wide, will cost | ... | ... | £3 15 0 |
| Do. of 100 yards, 24 ins. wide | ... | ... | 5 0 0 |
| Do. of 100 yards, 30 ins. wide | ... | ... | 6 5 0 |
| Do. of 100 yards, 36 ins. wide | ... | ... | 7 10 0 |

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has in many instances been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.



C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2¼ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. YOUNG and Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

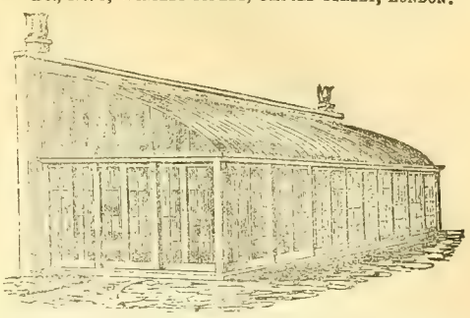
---

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

| | | Galvanised. | Japanned Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24-inch wide | ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch ,, strong ,, | ... | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, | ... | 12 ,, | 9 ,, |
| ¾-inch ,, light ,, | ... | 8 ,, | 6 ,, |
| 1⅜-inch ,, strong ,, | ... | 10 ,, | 8 ,, |
| 1⅜-inch ,, extra strong ,, | ... | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

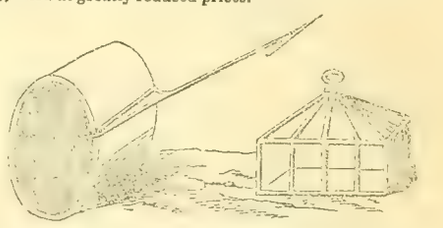
Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.



---

WILKS'S GOLDEN TAPESTRY PATTERNS.—Under this distinctive title, a new and beautiful style of decorative Needlework on Canvas, representing Flowers, Ornament, &c., has just been introduced. The advantages these Patterns possess over the Berlin Patterns, are, firstly, their great simplicity, being tinted for working in four colours only, viz., three shades of gold colour, grounded in crimson, blue, or green: secondly, their being drawn on a large check, calculated for working on coarse canvas; in addition to which, all the lines being on the surface, instead of being obliterated by a thick layer of colour, as in the Berlin Patterns, they are followed with the greatest ease, without fatiguing the eye. Ladies are respectfully invited to an inspection of the worked specimens exhibited at the Warehouse, 186, Regent-street, as affording the best practical illustration of the boldness, the richness, the beauty, and the varied applicability of these Patterns. They are perfectly new, both in principle and effect, and are quite distinct from the British Gobelin Crochet Patterns, published at the same house. The series has commenced with squares for Cushions, &c., measuring, when worked, about 20 inches, 2*s.* 6*d.* each, free for 36 stamps, or two under one cover for 5*s.* 6*d.*; also borders or stripes, 1*s.* the sheet, or free for 14 stamps.

WILKS'S Warehouse, 186, Regent-street, London.



---

COTTAM & HALLEN, ENGINEERS, IRON FOUNDERS, &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON.

COTTAM and HALLEN having had long experience in the erection of HOTHOUSES and CONSERVATORIES (made of Iron or of Iron and Wood combined), and from many improvements they have made during that time, can with confidence undertake to erect such buildings with economy and dispatch.

HOT WATER APPARATUS for heating the above and other buildings (of which they have constructed upwards of 3000), fixed at greatly reduced prices.

COTTAM and HALLEN have on show, at their repository, No. 2, Winsley-street, Oxford-street, a great variety of the following articles, for GARDENS, &c., at Greatly REDUCED PRICES, viz.:—

| | |
|---|---|
| Garden Rollers | Hand-glass Frames |
| Garden Engines | Flower Stakes |
| Garden Syringes | Flower-bordering |
| Watering Pots | Flower Stands |
| Garden Vases | Garden Arches |
| Mowing Machines | Garden Chairs |

Every description of Work, both Plain and Ornamental, in wrought and cast iron, for Gardens, &c., &c.

HORTICULTURAL TOOLS and AGRICULTURAL IMPLEMENTS of all kinds.

STRONG IRON HURDLES, strained Wire Fencing, &c.

Show Rooms at the MANUFACTORY, 2, Winsley-street, and 76, Oxford-street, three doors West of the Princess's Theatre.

---

THE BRITISH FLORA; comprising the Phænogamous or Flowering Plants and the Ferns. The Sixth Edition, with Additions and Corrections; and numerous Figures illustrative of the Umbelliferous Plants, the Composite Plants, the Grasses, and the Ferns. By Sir W. J. HOOKER, F.R.A. & L.S., &c.; and G. A. WALKER ARNOTT, LL.D., F.L.S. & R.S. Ed.; Regius Professor of Botany in the University of Glasgow.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

HAYMAKING ECONOMISED.

WEDLAKE AND THOMPSON, Inventors, Improvers, and Manufacturers of the double-cylinder HAY MACHINE (which obtained the prize of the Royal Agricultural Society), beg to call the attention of agriculturists to the above valuable Implement; the motion of which, by a very simple contrivance, is reversed, and turns the hay after being shaken from the swathe, thereby effecting a considerable saving in the expence of manual labour. Horse, Hay, and Corn Rakes, Oat Bruisers, and every description of Agricultural Implements, upon the most improved principle, and at a great reduction in price.—Address Union Foundry, Hornchurch, Essex.

FOWLER'S PATENT DRAINING APPARATUS.—GRAND EXHIBITION, No. 28, Class 9.—A PUBLIC TRIAL of the above Machine (which cuts the drain and lays the pipes at one and the same operation without disturbing the surface) will take place at WORMHOLTS SCRUBBS, on and after WEDNESDAY, the 28th May, until further notice. Carriages and equestrians can enter by Wood-place, Shepherd's-bush, and will be permitted free ingress and egress into the Scrubbs during the time of trial, between the hours of Nine o'clock and Four in the afternoon.

May 31. For JOHN FOWLER, Jun., HENRY LOWCOCK.

P.S. Distance from the Exhibition, across Kensington Gardens, about three miles.

THE GREAT EXHIBITION.—HINTS TO VISITORS.—Among the tens of thousands who will grace the Industrial Fair, every nation will contribute bright samples of its youth, beauty, and fashion. The frequenters of the Ball, the Public Assembly, and the Promenade, will find both personal comfort and attraction promoted by the use of ROWLAND and SONS' valuable aids; and what better mark of esteem can be offered to friends on their return home, as a momento of the Great Exhibition, than a packet of

"ROWLANDS' UNIQUE DISCOVERIES."

ROWLANDS' MACASSAR OIL,

For the growth, and for preserving, improving, and beautifying the Human Hair.

ROWLANDS' KALYDOR,

For improving and beautifying the Skin and Complexion, eradicating all Cutaneous Eruptions, Sunburn, Freckles, and Discolorations, and for rendering the Skin soft, clear, and fair.

Sold by A. ROWLAND and SONS, 20, Hatton-garden, London; and all Chemists and Perfumers.

WHITSUNTIDE HOLIDAYS.

THE ZOOLOGICAL GARDENS, REGENT'S PARK, contain three ELEPHANTS, and an ELEPHANT CALF; HIPPOPOTAMUS, RHINOCEROS, GIRAFFES, and four pairs of LIONS. Admission Sixpence every day in Whitsun week, except Saturday.

NEW SHOW ROOMS FOR BEDSTEADS.

HEAL AND SON have erected some extensive Warerooms for the purpose of keeping every description of Bedsteads. In Iron their Stock will include every sort manufactured, from the cheap Stump, for servants' use, to the handsomely ornamented tubular-pillared Canopy, as well as Brass Bedsteads of every shape and pattern; and in wooden Bedsteads their Rooms are sufficiently extensive to allow them to fit up a variety, both in Polished Birch and Mahogany, of Four-post, Canopy and French, and also of Japanned Bedsteads—in fact, to keep in Stock every sort of Bedstead that is made; and they have also a general assortment of Furniture Chintzes, Damasks, and Dimities, so as to render their Stock complete for the Furnishing of Bedsteads as well as Bedding. And without attempting to compete with the prices at which the lowest class of Furniture is sold, and which is fit for no useful purpose, their new Stock will be found to be priced on the same principle by which their Bedding Trade has, during the last 30 years, been so successfully extended, and the goods, whether of a plain and simple pattern, or of a handsomer and more expensive character, are of well-seasoned materials, sound workmanship, and warranted.

HEAL and SON'S List of Bedding, containing full particulars of Weights, Sizes, and Prices of every description of Bedding, sent free by post, on application to their Factory,

196 (opposite the Chapel), Tottenham Court Road, London.

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—The Public is respectfully informed, that these favourite Ales may be had genuine, in casks of 18 gallons and upwards, at their respective stores, as under where also a list of the bottles may be obtained.

The Brewery, Burton-on-Trent; Stores, 61, King-William-street, City, London; Cook-street, Liverpool; High-street, Birmingham. The Exchange, Manchester, 33, Virginia-street, Glasgow.

BEDSTEADS, BATHS, and LAMPS.—WILLIAM S. BURTON has OPENED THREE LARGE ADDITIONAL SHOW-ROOMS, communicating with his original ones (which are the largest in the kingdom), devoted exclusively to the SEPARATE DISPLAY of Lamps, Baths, and Metallic Bedsteads. The stock of each is at once the largest, newest, and most varied that has ever been submitted to the public, and marked at prices proportionate with those that have tended to make his establishment the most distinguished in this country.

| | | |
|---|---|---|
| Bedsteads, from | ... ... | 12s. 6d. to 12l. each. |
| Shower Baths, from | ... ... | 7s. 0d. to 7l. each. |
| Lamps (Palmer's), from | ... | 1s. 6d. to 6l. each. |

(All other kinds at the same rate.)

Palmer's Candles ... ... ... 6½d. per lb.

WILLIAM S. BURTON'S Stock of GENERAL FURNISHING IRONMONGERY, including Cutlery, Nickel Silver, and Plated Wares, is literally the largest in the world, detailed Catalogues of which, with engravings, sent (per post) free. The money returned for every article not approved of.—39, Oxford-street (corner of Newman-street), Nos. 1 and 2, Newman-street, and Perry's-place, London. Established in Wells-street, 1820.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—The SECOND EXHIBITION of PLANTS, FLOWERS, and FRUIT, will take place on WEDNESDAY next, JUNE 11th; and the Exhibition of ROSES on SATURDAY, JUNE 21st.

Tickets, to admit the holders to either of the above Exhibitions, for upon any one day in the month of June, except Sundays, may be obtained at the Gardens by orders from Fellows of the Society, or by letters from Foreign Ambassadors and Ministers, 5*s.*: or on the days of Exhibition, 7*s.* 6*d.* each. The Gardens open at 2 o'clock.

N.B. The Ticket Office closes at 6 o'clock. The Victoria Regia continues to flower freely.

NATIONAL FLORICULTURAL SOCIETY, 21, REGENT-STREET.

NOTICE is hereby given, that the Censors—J. Riley, Esq., Huddersfield; W. H. Story, Esq, Newton Abbott; Rev. R. Carth, Farnham; C. J. Perry, Esq., Handsworth; R. Stains, Esq., London; J. W. Newhall, Esq., Woolwich; W. Cock, Esq., Chiswick: Mr. J. Keynes, Salisbury; C. P. Lochner, Esq., Paddington; Mr. T. Moore, Chelsea; and Mr. Gaines, Battersea, will be in attendance on THURSDAY, June 12th, at 1 o'clock precisely, at which time all subjects must be entered, labelled, and staged.

The Committee begs to announce that as a large number of members and floral friends may be expected in town by the combined influences of the Royal Botanic Exhibition, the Gardeners' Benevolent Anniversary, the Seedling Pelargonium Meeting, and other causes, this meeting may therefore possess additional interest. Every facility will be granted for the admission of Non-members at an early hour; Exhibitors and Censors will therefore be punctual in their attendance, and prompt in their arrangements. By order,

June 7. JOHN EDWARDS, Hon. Sec.

SEEDLING PELARGONIUM EXHIBITION, ROYAL BOTANIC GARDENS, REGENT'S PARK, on WEDNESDAY, JUNE 11, 1851.

The Subscribers to the PELARGONIUM SEEDLING FUND are respectfully informed that the Censors specially appointed will (by the kind permission of the Royal Botanic's Council), be in prompt attendance at 10 o'clock to award the Prizes, the amounts of which will be made known at the earliest opportunity; the number will be limited to seven, and the whole of the Funds subscribed will be awarded in proportion to the merits of the productions.

In connection with the above, a Fund has been subscribed to reward meritorious Fancy Seedling Pelargoniums, in four Classes, and three Prizes in each Class.

The Censors for both Classes are—

J. RILEY, Esq, Birkley, near Huddersfield.
R. STAINS, Esq., Marylebone.
Mr. JAMES VEITCH, Jun., Exeter.
Mr. ROBINSON, Pimlico.
W. COCK, Esq, Chiswick.

JOHN EDWARDS, Wace Cottage, Holloway, Treasurer.

Subscribers will do well by forwarding their Donations prior to the Exhibition day, to facilitate the arrangements.

SCARLET RUNNER BEANS.—For SALE, a few bushels of SCARLET RUNNERS, at 25*s.* per bushel—Apply to Mr. HENRY CLARKE, Seed Merchant, 39, King-street, Covent-garden, London.

BEAUTIFUL BOUQUETS OF FLOWERS may be preserved perfectly fresh and blooming, for several days, in GLASSES adapted for gentlemen's coat button-holes, any part of a lady's dress, the hand, or for plaiting into the hair; and are forwarded to any part of the kingdom, post free, in a box containing one dozen of the various kinds, on receipt of postage stamps value 2*s.* 6*d.*, by JACKSON and TOWNSON, 89, Bishopsgate-street Within, London.

THE VICTORIA REGIA IS NOW FLOWERING, GROWING IN THE OPEN AIR, AT

J. WEEKS AND CO'S., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers.

NEW DAHLIAS; E. FOSTER'S, ESQ., CHOICE PELARGONIUMS; PICOTEES, CARNATIONS, HOLLYHOCKS, PANSIES, &c.

WILLIAM BRAGG, Star Nursery, Slough, begs to say his Catalogue of the above Flowers is now ready, and can be had on application. His choice SEEDLING DAHLIAS will be sent out the first week in May at 10*s.* 6*d.* each, viz:—

ADMIRAL, rich lilac, very constant, gained first Seedling prize, 25*s.*, at the Royal South London Exhibition; 21*s.* Shacklewell Open Shows, &c., fourteen first class certificates; the most successful flower of the year.

CARMINA, rich carmine, constant show flower, gained six first class certificates, &c., shown in several winning stands.

The Hon. Mrs. ASHLEY, waxy white, tipped with rose, splendid show flower, &c. W. B. thinks it the best Dahlia of the season; was awarded by Dr. LINDLEY a certificate of merit at the Horticultural Society, &c. Gained five first class certificates.

QUEEN OF FAIRIES, Domeyer. W. BRAGG has purchased the stock of this fine and constant fancy Dahlia, from the above amateur, who will give 5*l.* in prizes the next season for this flower. It gained a Seedling prize and first class certificate, with Edwards's Mrs. HANSARD; at the Royal South London Open Show Exhibition five first class certificates.

W. B.'s stock of Picotees, Carnations, and Pinks are strong and good; the best Hollyhock Seed ever sent out can be had in 2*s.* 6*d.* and 5*s.* packets, post paid, for prepayment.

CALIFORNIAN FLOWER SEEDS.—The undersigned having received a collection of CALIFORNIAN SEEDS, chiefly Perennials, among which some striking novelties may be anticipated, he offers them at the following prices, in small packets, prepaid:—

The entire collection of 30 packets ... 18*s.*
Half of ditto, or 15 ditto ... ... ... 9*s.*
A selection of 10 sorts ... ... ... 7*s.* 6*d.*

Referring to his advertisement in the *Gardeners' Chronicle* of the 3d and 10th inst., he begs to suggest, that the flower seeds may still be sown with advantage during the next fortnight. Of the hardy Annuals, he recommends half to be sown now, and the other half in the autumn, for early flowers next year. The cold, backward springs of late, render such precaution necessary. Perennials and Greenhouse Seeds may be sown till July.

JAMES CARTER, Seedsman and Florist, 238, High Holborn, London.

MITCHELL'S SUPERB SHOW OF RANUNCULUSES.

EDWARD MITCHELL, FLORIST, Bristol Gardens, Brighton, begs most respectfully to inform the Admirers of the RANUNCULUS that his unrivalled Beds, containing upwards of 70,000, is now on view every day except Sundays, and Tickets may be had, at 1*s.* each, of Messrs. Hurst and McMullen, Seedsmen, Leadenhall-street, London; and at E. MITCHELL'S, 55, Marine Parade, Brighton.

EDWARD GEORGE HENDERSON begs to call attention to the following NEW and SELECT PLANTS, for descriptions and prices of which he begs to refer to his new Spring Catalogue, which will be sent post free on application.

STOVE PLANTS.

ACHIMENES Baumannii hirsuta, A. coccinea grandiflora, A. Kleii, A. longiflora alba (or jamregia), A. gloxiniflora, A. Tugwelliana. GLOXINIA argyrostigma, G. Grande Duchesse Helené, G. Maria Van Houtte, G. Madame Malibran, G. Virginalis, G. Madame Aglaé Adanson, G. spectabilis, G. Victoria Regina. Æschynanthus pulchellus, Alloplectus sparsiflorus, Begonia fuchsioides alba, 5*s.*; Capanea grandiflora, Gordonia javanica, Centroselina glabra, Clitoria brasiliensis, Cyrtanthera magnifica, Cyrtoceras Paxtonii, Dipladenia urophylla, Dipteracanthus spectabilis, Echites nobilis grandiflora, Eranthemum leuconervum, Erionema enea, E. marmoria, Franciscea eximia, F. macrophylla grandiflora, Gesnera coruscans, G. macrantha purpurea, Hebeclinium ianthinum, Inga splendidissima, Isoloma triflora, Ixora salicifolia, Lycopodium Wildenovii, L. cœsium arboreum, Passiflora alata superba, Rogiera alba, R. amœna, R. cordata, R. thyrsiflora, Sinningia punctata, Siphocampylus longipes, S. orbiguanis, and Thyrsacanthus barlerioides.

GREENHOUSE PLANTS.

Azalea Symmetry, Aphelexis Barnesii, Burtonia pulchella, Calceolaria grandis, Chorozema lanceolata, Daphne Fortunii, Gloriosa species nova, Hardenbergia ovata alba, Hemiandra pungens, Jasminum Poiteau, Leschenaultia formosa (Hunt's variety), Oxalis elegans, O. caprina pleno, Passiflora cærulea grandiflora, Rhododendron formosum, R. javanicum, Statice Halfordii, Stylidium (two species), Tacsonii Hellerii (distinct), Tagelia bituminosa, Tehlia fuchsioides (a fine free blooming winter plant), Tritonia aurea, Tree Carnations (for winter blooming), Tropæolum Hockerii (flowers in summer and winter), Zichya europhylla nana, Lantana Bonardii, L. duratifolia, L. grandiflora (fine), and Epacris delicata.

ERICAS.

Candolleana, cerinthoides coronata, favoides purpurea, Devoniana, Holfordiana, longiflora, Murrayana, Princeps Templæa, retorta splendens, tricolor Wilsonii superba, tricolor rosea, ventricosa Bothwelliana, ventricosa grandiflora (Story's variety), Vernonii superba, inflata rubra, &c.

RHODODENDRONS.

Aureum Broughtonii, aureum congestum, aureum macranthum flavum, aureum superbum, Ambrosii, Jacksonii, Boddaertianum, Mars, &c.

BEDDING AND OTHER PLANTS.

Calceolaria Hero (Cattell's), fine dark; C. sulphurea splendens, C. viscosissima major, C. Sultan (fine dark crimson), Heliotrope Gem (fine); six varieties of Phlox Drummondii, distinct colours; Lobelia erinus oculata, herbaceous Lobelia compacta, herbaceous Lobelia Aurora, Salvia amabilis, Pentstemon gentianoides Esterii, P. Cobæa (not blue, as stated in error in catalogue), and Campanula carpatica alba, 1*s.* 6*d.* each, or 12*s.* per dozen.

E. G. H. recommends his NEW FUCHSIAS "Prime Minister," "Resplendent," "Lord of the Isles," and "Madame Sontag," and many other novelties which will be found in the Catalogue.

Wellington-road Nursery, St. John's Wood, London, June 7.

JOHN HAYES, FLORIST, Farnham, Surrey, begs to state that he has a large stock of BEDDING GERANIUMS (strong plants), he can send out at 2*s.* 6*d.* per dozen in pots; 2*s.* per dozen out of pots; and a few other kinds of Bedding Plants 1*s.* 6*d.* per dozen out of pots. Descriptive Catalogue sent on the receipt of one postage stamp.

TO THE VISITORS OF THE GREAT EXHIBITION.

HENRY GROOM, Clapham Rise, near London, by appointment FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to say that his collection of ANEMONES is now in bloom; and that he expects his extensive assortment of RANUNCULUS will be in flower towards the middle of next week. They may be viewed from 9 o'clock until 6, Sundays excepted. Admittance gratis.

Priced Agricultural Seed Lists supplied on application.

BASS and BROWN, Seed Establishment, Sudbury, Suffolk.

CHRYSANTHEMUMS.

CHANDLER AND SONS, NURSERYMEN, Wandsworth Road, London, are now sending out the best varieties of CHRYSANTHEMUMS from 9*s.* to 12*s.* per dozen; good sorts, for borders, 6*s.* per dozen. A printed list, with names and colours, can be had.

Post-office orders payable at Kennington Cross.

"THE FLOWER OF THE DAY."—This elegant variegated GERANIUM may now be seen in bloom, under glass and bedded out, at J. and C. LEE'S Nursery, Hammersmith, near London.—June, 1851.

THE BEST EARLY TURNIP FOR FIELD CULTURE.

SUTTON'S EARLY SIX WEEKS. A field of these Turnips, grown by Mr. E. W. Moore, Steward to Earl Radnor, on poor soil, at Coleshill, gained the 20*l.* prize at the Farringdon Agricultural Show in 1849.

JOHN SUTTON and SONS confidently recommend the above for first sowing, to feed off for Wheat.

*Also, for succession, the New Lincolnshire Red, and* SUTTON'S *Purple-topped Hybrid yellow Turnip.*

The Lincolnshire Red Turnip (the stock of which was presented to Messrs. SUTTON, in 1849, by Philip Pusey, Esq., M.P.), should be fed off before Christmas; and SUTTON'S Purple-topped Yellow Hybrid, which is equal to a fine Yellow Swede, may be sown very late with certainty of success, and will keep till spring either in the field or housed.

Sold in quantities of not less than 10 pounds weight, at the undermentioned prices. *Carriage Free*, to any station on the Great Western, South-Western, or South-Eastern Railways:—

SUTTON and SONS, Seed Growers, Reading, Berks.

Agents for the sale of Rivers's Stubble Swede Seed.

CHOICE SEEDS, suitable for present sowing, all of the best quality. Per paper.—*s.* *d.*

| | | |
|---|---|---|
| ANTIRRHINUM, saved from a superb collection | 0 | 6 |
| ANEMONE, new hybrid, splendid colour | 0 | 6 |
| CALCEOLARIA, saved by an amateur, from the most splendid show flowers | 1 | 0 |
| CINERARIA, from the choicest show flowers, saved by one of the best growers, from a superb collection of prize show flowers | 1 | 0 |
| HOLLYHOCK, double, saved by a celebrated grower, from Chater's best flowers | 1 | 0 |
| PANSY, very choice, saved by Thomson, and other celebrated growers | 1 | 0 |
| SWEET WILLIAM, very fine, singular colour | 0 | 6 |
| STOCKS, AUTUMNAL FLOWERING, 6 best and brightest colours, very double (per collection) | 1 | 6 |
| WALLFLOWERS, 6 beautiful varieties, imported; these will produce a proportion of double flowers (per col.) | 1 | 6 |

The above are confidently recommended, having given great satisfaction previous seasons.—To be had of WILLIAM DENYER, Seedsman and Florist, 82, Gracechurch-street, London.

"CANTUA DEPENDENS."

(A beautiful new Hardy Greenhouse Plant from Peru.)

MESSRS. VEITCH AND SON have the greatest satisfaction in offering to the Public the above lovely plant, from the Andes of Peru, where the flowers are so much esteemed by the natives that they adorn their chambers with them on feast days.

It was exhibited in Regent-street on the 15th of April last, and received the "*Large Silver Medal*" (see *Gardeners' Chronicle* of April 19th.)

It was again exhibited at Chiswick on the 3d of this month, and was then awarded the highest prize given for new plants—"*The Silver Gilt Medal.*"

It is a plant of neat habit and foliage, blooms freely in a small state, and may be kept in a cold pit or frame through winter, being of about the same hardiness as the Fuchsia, and as easy of cultivation; from its novelty and beauty, it will be an acquisition to every collection, and be cultivated by every florist. It is figured in Curtis's "Botanical Magazine" for this month, and will also shortly appear in Paxton's "Flower Garden." Good established plants will be sent out on and after the 12th of June, at 21*s.* each, with the usual discount to the Trade.—Exeter, June 7.

THOMAS JACKSON AND SON'S PRICED CATALOGUE OF PLANTS is now ready, and may be obtained by prepaid application; it contains Orchidaceous, Stove, Greenhouse, and Herbaceous Plants; Roses, Shrubs, Ornamental Trees, &c. &c.
Nurseries, Kingston, Surrey, June 7.

CHOICE CINERARIA SEED.

LUCOMBE, PINCE, AND Co., have saved from a Select Collection of all the Newest and Finest Varieties of 1851, which they have this season grown in great perfection, some Cineraria Seed, of excellent quality; and they beg leave to offer it for sale, in Packets, sealed and warranted by them, at 2s. 6d. each, free by post. If sown soon, strong plants will be produced, which will flower in 1852.
Exeter Nursery, June 7th.

"BERBERIS DARWINII."
(Beautiful Hardy Evergreen Shrub, from the Snow Line on the Andes of Patagonia.)

MESSRS. VEITCH AND SON feel the greatest confidence in offering for sale the above valuable BERBERIS, a plant and also a cut specimen of which were exhibited at the Horticultural Society's Rooms in Regent-street, the 1st of April last, and received the "*Large Silver Medal.*" They beg to refer to Dr. Lindley's report in the *Gardeners' Chronicle* of April 5th, as follows:—

"This proves to be a species whose importance it is almost impossible to overrate, inasmuch as it is exceedingly handsome, perfectly hardy, and naturally produces its rich orange blossoms in great profusion during the early months of the year. Indeed, for general value, we have nothing at present at all to be compared with this fine Berberry."

Strong plants will be ready for sending out on and after the 12th of June next, at 21s. each, with the usual allowance to the trade.—Exeter, June 7.

GERANIUMS.

BASS AND BROWN have still a fine Stock of the following choice GERANIUMS, bushy plants, with abundance of buds, for immediate flowering: Magnificent, Flying Dutchman, Painter, and Prince of Orange, 3s. 6d. each.

Cassandra, Cavalier, Clara, Crusader, Distinctus, Elegans, Empo, Forget-me-not, Grandiflora, Gulielma, Jenny Lind, Queen of Scots, Painted Lady, Princess, Rachael Superb, Rebecca, Refulgent, Resplendent, Rolla, Rosa Mundi, Scarlet Defiance, Star of the West, Sundown, Symmetry, and Windsor Castle. The above set of 25 for 30s., or any 12 for 18s.

Augusta, Brockii, Camilla, Desdemona, Duke of Cornwall, Duke of Hamilton, Gigantic, Isabena, Josephus, King, Lord Chancellor, Madeline, Marmion, Minna, Mogul, Mustee, Negress, Orion, Peri, Pluto, Pulchellum, Rosy Circle, Sarah Jane, Sir Robert Peel, The Jew, and Zenobia. The set of 25 for 15s., or any 12 for 9s.

Also the following fancy varieties:—Anais, Black Prince, Beauty of Winchester, Clown, Dandy, Harlequin, Jehu Improved, Jenny Lind, La Belle d'Africana, Lady F. Hastings, Maid of Anjou, Mazeppa Superba, Princess Alice Maude, Princess Helena, Queen of Summer, Statiaski, and Yeatmannianum. The set for 15s., or any 12 for 12s.

Catalogues supplied free on application.
Seed and Horticultural Establishment, Sudbury, Suffolk.

MEDINILLA MAGNIFICA.

MESSRS. VEITCH AND SON have much pleasure in offering this splendid and unique Stove Plant, with pendulous bunches of flowers 12 to 18 inches in length, having beautiful large rose-coloured bracteas.

It was exhibited at the Horticultural Society's Room, Regent-street, on the 2d of April, 1850, and was awarded the "*Large Silver Medal.*" For description, see *Gardeners' Chronicle*, April 6th, 1850.

It was again exhibited at Chiswick, on Saturday last, May 3d, where it received the "*Certificate of Excellence.*"

It is figured in Curtis's "Botanical Magazine" for September, 1850.

It has been so much admired by all who have seen it, and is altogether so first-rate a plant, that Messrs. VEITCH and SON can recommend it with the most perfect confidence.

Strong plants will be ready for delivery on and after the 12th of June next, at 63s. each, with the usual allowance to the trade; and, when six plants are taken, an additional one will be put over.—Exeter, June 7.

TRANSPLANTED TURNIP SEED.

R. JOSLING begs to offer to Agriculturists his very excellent variety of PURPLE-TOP SWEDE, a cross between the Golden Melon and the Liverpool, decidedly one of the best in cultivation—a heavy cropper, stores well, best quality, seed warranted growth of 1850, from Transplanted Roots, at 1s. 3d. per lb.

All orders of 25 lbs. and upwards carriage free to any Railway Station in England, or packet office in London. A remittance must accompany the Order.
ROBERT JOSLING, General Seed Warehouse, St. Alban's, Herts.

IPOMŒA LIMBATA (LINDLEY).
(A New and Beautiful Hardy Climbing Annual.)

MESSRS. WM. ROLLISSON AND SONS have the pleasure to inform the Nobility, Gentry, and Public in general, that they intend sending out, on and after the 24th of June, their new and beautiful IPOMŒA (named by Dr. LINDLEY Ipomœa limbata), 10s. 6d per plant, just coming into flower; the usual discount to the trade.

N.B. Fine plants of the true RHODODENDRON JAVANICUM, from 7s. 6d. to 10s. 6d. and 21s., according to the size of the plant.—Tooting, Surrey.

TO TURNIP GROWERS.—Observing the great superiority of some sorts of Turnips, both as to bulk and nutritive properties, J. SUTTON AND SONS have for many years paid especial attention to that important agricultural root; and having carefully tested the comparative merits of many varieties, *they can with the greatest confidence recommend the sorts named in their Advertisement in the first page of this week's Paper*, where the prices are also quoted (carriage free).

PERMANENT PASTURE GRASSES,

*Mixed expressly to suit the soil for which they are required, at the reduced prices of 22s. 6d. to 28s. per acre.*

*From a Member of the Council of the Royal Agricultural Society.*

"Messrs. SUTTON,—I was particularly pleased with your Grass Seed, which I employed by itself for laying down some fresh broken-up Land. It became a close fine sward by August. I have now about 30 acres of land to sow immediately, &c., and shall be glad of your advice for the purpose."

*From a Clergyman, an eminent Agriculturist and Member of the Royal Agricultural Society.*

"I have had the pleasure of praising your Seeds in many quarters beside that to which you refer. This I have done from a sense of justice only."

*Another Clergyman writes us:*

"My Turnip crops are the admiration of all the farmers round, especially the Swedes and your Purple-topped Hybrid. I hope you have some of the same kind this year, as I am certain the superiority of my crops is mainly owing to the stocks."

*The above are similar to hundreds of others.*

N.B. Instructions for sowing accompany every parcel of Grass Seeds; and any other information required by post will be promptly given.

*Goods delivered free of carriage to any office in London, Bristol, Gloucester, Exeter, Southampton, &c.*

Address JOHN SUTTON and SONS, Seed Growers, Reading, Berkshire.

AZALEA INDICA "SYMMETRY."

J. AND C. LEE are now sending out this fine variety, well established plants, 21s. each, with the usual discount to the trade.
Nursery, Hammersmith, near London, June, 1851.

GLOXINIA "PETOIANA."—Messrs. YOUELL and Co. have the greatest satisfaction in offering the above magnificent Gloxinia, raised at the seat of Samuel Morton Peto, Esq., M.P., Somerleyton Hall, Suffolk, and is without exception the handsomest of the genus. The flowers are white, suffused with the most delicate tint of blush, the upper and lower parts of the throat being surrounded (as in Gloxinia Fyfiana) with the richest crimson Lake. The following opinion of it is given in the *Gardeners' Journal* of Sept. 14th, 1850: "Superb in substance; ground white, of crystal-like appearance, just tinged with an exquisite shade of blush; the lower portion of the throat is magnificent crimson lake, minutely speckled with the same towards the base of the bloom, which is of the most perfect consistency."

Good established plants will be sent out on and after the 26th of June at 15s. each, with the usual discount to the trade when three or more are taken.—Royal Nursery, Great Yarmouth.

COCHIN CHINA HENS, AND NEW-LAID EGGS FOR SETTING, FOR SALE.—Apply by letter, post-paid, to "W. O.," at Mr. MacLachlan's, 6, Birchin-lane, Lombard-street, London.

SHEET GLASS.

A. ADAMSON, 20, Davies-street, Berkeley-square (from C. Jarvis, Castle-street, Oxford-street), begs to acquaint gentlemen and gardeners that he has a superior stout Sheet Glass, in sizes from 12 by 10 to 40 by 30, at 3d. per foot, almost free from those defects on the surface generally found in common Horticultural Glass, and which is so detrimental for Horticultural purposes, on account of its acting as a lens, and destroying the plants it was intended to protect.

GLASS MILK PANS, &c. &c.

JAMES PHILLIPS AND Co., 116, Bishopsgate-street Without, beg to hand their prices of various articles for the dairy and domestic purposes.

MILK PANS.

G. and J. DEANE are sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with the Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom.

Also, wholesale and retail Agents for Saynor's celebrated Pruning Knives, used exclusively by the first gardeners in the United Kingdom. GEORGE and JOHN DEANE (opening to the Monument) London Bridge.

NEW HARDY JAPAN PLANT.
DEUTZIA GRACILIS (true)

JOSEPH BAUMANN, Nurseryman, Ghent, Belgium, having a good stock of the above beautiful and distinct DEUTZIA, will send it out on the 1st of August.

Extra strong well established plants ... ...£1 0 0
Smaller do. do. ... ... ... 0 12 6
Grafted, 4 to 5 feet high ... ... ... ... 2 6 0

J. B.'s Deutzia gracilis will never grow higher than 2 feet. Messrs. Hugh Low and Co., of Clapton, have seen it in bloom, and have ordered 40 plants of it.

This plant may be had in bloom six months in the year.

J. B. has received the following prizes for this plant. 1850, Ghent first prize; 1851, Chiswick, May the 3d, prize of excellence; Regent's Park, May 14th, first prize. Bruxelles first prize, Antwerp first prize, Mechlin first prize, Louvain first prize, Mentz first prize, Erfurt first prize, Paris first prize.

One over to the Trade on three. No discount if less than three plants are ordered. Free to London.

Deutzia crenata vera, new (D. gracilis of some), 1s.

NOTICE.—AMERICAN PLANTS.

GEORGE BAKER begs to announce that his extensive collection of AMERICAN PLANTS will be in b oom on and after the 30th May, and may be seen gratis. The Nursery is situated seven miles from Staines Station, South-Western Railway, and three miles from Virginia Water, where conveyances may always be obtained.

G. B. takes this opportunity of informing the Nobility, Gentry, and Public that he is a Contributor to the American Exhibition, Royal Botanic Garden, Regent's Park.

Windlesham Nursery, Bagshot, Surrey, June 7.

ROSE NURSERIES, HERTFORD.

E. P. FRANCIS offers the following Stock of Bedding-out Plants, strong and vigorous, in 60-size pots, and which will be sent to any part of the kingdom, carriage paid to London:

SCARLET GERANIUMS, Tom Thumbs, &c., 4s. per doz., strong.
VERBENAS, all the best varieties in cultivation, 3s. per doz.
SALVIAS, blue and red, 4s. per doz.
FUCHSIAS, all the best leading varieties, 4s. per doz.
HELIOTROPES, including the new varieties, 3s. per doz.
PENTSTEMONS, fine varieties, 4s. per doz.
AGERATUM CŒLESTINUM, 3s. per doz.
CALCEOLARIAS, Viscosissima and other varieties, 3s. per doz.
ANAGALLIS, blue and red, 4s. per doz.
NIEREMBERGIAS, 4s. per doz.
CUPHEA PLATYCENTRA, 3s. per doz.
GAILLARDIA PICTA, &c., 3s. per doz.—June 7.

THE AMERICAN NURSERY, BAGSHOT, SURREY.

JOHN WATERER begs to announce that his splendid Collection (containing many thousand specimens) of RHODODENDRONS, AZALEAS, &c., is now in full bloom, and may be seen daily, gratis, Sundays excepted.

The Nursery is situated three miles from the Blackwater Station, South-Eastern Railway, and near the Farnborough Station, South-Western Railway.—Conveyances are always to be obtained at either Station.

He also begs to state, that he is the principal contributor to the great American Plant Exhibition, now on view at the Botanic Gardens, Regent's Park.

JAMES TURRELL has to offer the finest and best New Scarlet GERANIUMS in cultivation.

FIRE KING.—Intensely vivid scarlet, very clear white eye, fine habit, and free bloomer (*individual* flowers, 1½ inch in diameter). Price 7s. 6d., strong.

WARNEFORD PET.—Bright scarlet, with white centre; good shape. This variety is most valuable for bedding, as it is more dwarf than compactum, and a good bouquet flower. Price 5s., strong.

NEW FANCY PELARGONIUM, "STRIATA COCCINEA."—Beautiful dark mulberry upper petals, the lower strikingly veined, and of the same colour. Price 10s. 6d.

Strong Bedding Plants, of sorts, 4s. per dozen; Crusader and Mount Etna, 1s. each. The Trade liberally treated.

Providence Nursery, Ramsgate.

FERNS.—The present prevailing taste for this interesting and elegant tribe of plants, has induced the Subscribers to offer them in selections as under:—12 distinct exotic species, 30s. to 60s.; 25 ditto, 50s. to 100s.; 20 distinct hardy species, 1s. to 1s. 6d. each. Selection of sorts left to H L. and Co. It would be advisable to state if they are required for Wardian cases, as small growing sorts would then be selected.—Hugh Low and Co., Clapton Nursery, London.

SELECT BEDDING PLANTS.

BASS and BROWN have a large and fine Stock of the following, well established, and now sending out; they are mostly in small pots, so as to be packed in a little compass. Those marked * can be sent free by post, if required.

SCARLET GERANIUMS, in variety, strong, 6s. and 9s. per dozen.
* VERBENAS, a large collection of the best sorts for forming dwarf beds, such as Apollon, Anacreon, Defiance, Emma, Eclipse, Eyebright, Junon, Princess Alice, Psyche, Rosati, Vulcan, White Perfection, and others, 4s. per dozen.
* PETUNIAS, a large collection of bright purple and crimson flowers, 5s. per dozen.
* FUCHSIAS, a large collection of select varieties, 5s. p. doz.
DAHLIAS, the best varieties, both show and fancy, 5s., 9s., and 12s. per dozen.
Heliotropes of sorts, 4s. to 6s.; Bouvardias of sorts, 9s.; Lantana crocea, 6s.; Lobelia maxima, erinus, &c., 4s.; Blue Anagallis, 6s.; Cupheas of sorts, 6s.; Calceolaria of sorts, 6s. and 9s.; Dielytra spectabile, 12s.; Cheiranthus alpinus, 12s. per doz., and many others.

Also the following selections of newer varieties:
GERANIUMS, 12 fine show vars., 12s.; 12 superb do., 21s.
FANCY GERANIUMS, 12 beautiful vars., 12s.; 6 for 7s. 6d.
* FUCHSIAS, 12 fine vars., 9s.; 12 superb new vars., 15s.
DAHLIAS, 12 fine vars., 9s.; 12 quite new vars., 21s.
" FANCY, 12 fine vars., 9s.; 6 quite new, 10s.
* PETUNIAS, 12 fine vars., 9s.; 12 superb new vars., 12s.
* VERBENAS, 12 fine vars., 7s. 6d.; 25 do., 12s.; 12 superb new, 12s.
HARDY BORDER PLANTS, 100 select vars., 30s.; 50 for 30s.
" " superior and new, 50 vars., 30s.; 25 for 17s. 6d.
ROCK PLANTS, 25 select vars., 12s.; 12 vars., 7s. 6d.
ANTIRRHINUMS, 12 fine vars., 6s.; 12 superb new, 10s.
PHLOX, 12 fine vars., 6s.; 25 vars., 10s. 6d.; 12 superb newer, 9s.
PENTSTEMONS, 12 fine vars., 7s. 6d.; 6 vars., 5s.
GREENHOUSE PLANTS, 12 select vars., 15s.; 25 fine vars., 28s.
STOVE PLANTS, 12 new and select vars., 18s. to 24s.
* ACHIMENES, 6 splendid new, 7s. 6d.; 12 fine vars., 9s.
GLOXINIAS, 6 splendid new, 7s. 6d.; 12 fine vars., 12s.
NEW PLANTS, see a List in the *Gardeners' Chronicle* for May 3d, April 26th, and April 19th.

Stamped Catalogues forwarded on application, free.

Remittances requested from unknown correspondents. Post-office orders to be made payable to Bass and Brown, or Stephen Brown. Postage stamps received for small amounts.

Bass and Brown, Seed and Horticultural Establishment, Sudbury, Suffolk.

HORTICULTURAL SOCIETY, 21, REGENT-STREET.
NOTICE IS HEREBY GIVEN,
THAT
MR. HOSEA WATERER'S
EXHIBITION OF AMERICAN PLANTS,
IN THE GARDEN OF THIS SOCIETY, AT
TURNHAM GREEN,
*Is now open Daily, from* 9 A.M. *to* 6 P.M.

Fellows of the Society are admitted *free*. Tickets for other persons, available for every day except Sundays and the 6th and 7th of June, can be procured in the Society's Garden, price One Shilling each.

The purchase of such a ticket admits the bearer to the Garden without the order of a Fellow of the Society

NOTICE.—EXHIBITION OF AMERICAN PLANTS, KNAP-HILL NURSERY, NEAR WOKING, SURREY.—The American Plants, at this Nursery, are now in bloom, and may be seen daily (gratis), Sundays excepted. The Knap-hill Nursery is within one hour's ride of London, being near the Woking Station, South-Western Railway, where nearly every train stops, and from whence conveyances may at all times be obtained.

Hosea Waterer takes this opportunity of stating that the Exhibition of American Plants in the Horticultural Society's Garden, Chiswick, is entirely supplied from his Nursery, and that he is *not* this year a contributor to that in the Botanic Gardens, Regent's-park.—Knap-hill, Woking, Surrey. June 7.

FUCHSIA "CLAPTON HERO" (Batten). Ditto "PAGODA" (Batten).—These can with confidence be recommended as the best of the dark varieties of this season; price 7s. 6d. each.

POTENTILLA LUCIA; or, BICOLOR GRANDIFLORA.—Colour, sulphur yellow, edged with scarlet; vigorous grower, and produces the largest flowers of any known variety; 5s. each.

POTENTILLA ANTWERPIENSIS.—Colour, dark brilliant orange, dwarf growth, producing semi-double flowers in great profusion, which do not close at night; 7s. 6d. each.

SWEET ORANGES, 18 inches to 2 feet, in Fruit; 10s. each.

Also all the new English and Continental Verbenas, Fuchsias, Liliputian Chrysanthemums, German Daisies, &c. For particulars of which we refer to our general Catalogue just published, which can be had by post, free, on application.

Hugh Low and Co., Clapton Nursery, London.

Country Shows.—Thursday, June 12: Cheltenham Horticultural and Floral, and Highbury and North London Horticultural.—Friday, June 13: Durham Horticultural.

A correspondent of ours, some time back, spoke in high terms of the value of glass pipes for the conveyance of water for the use of man, beast, and plant; such pipes being free from those evils which belong to lead and other metals, all more or less disposed to form poisonous salts, by the action of the water upon their surfaces.

Our correspondent was Mr. Osborne, who had read a paper on the subject before the British Association; he concludes with this remark,—"We see no reason why the prediction of Sir Robert Peel, that glass water-pipes would soon be laid down, should not be immediately verified." Green bottle glass is cheaper than iron, and Mr. Osborne, as well as others, distinctly advises that it should be employed for purposes of water conveyance.

Desirable as must have appeared the use of glass pipes, yet an apparently insurmountable difficulty has hitherto served to prevent their being adopted. How were the several lengths to be connected together? All the known contrivances by which pipes of the various materials are now united, were inapplicable for joining glass. If the material of glass be selected for its suitability to convey water, on account of its purity, it is clear that no substance would be admissible in the formation of a joint, which would give off the slightest taste, or which would not resist the action of the air or of damp, equally with the glass itself. Moreover the substance of the joint must necessarily be of a firmness and durability that would bear the pressure of a column of water equal to that which the pipes, even in extreme cases, could be called upon to sustain. And further, it was desirable that the joints should be *moveable*, so that accidental breakage should be easily repaired, and alterations in arrangements be effected without trouble or expense.

Such are the obviously indispensable properties which the joints of glass pipes are required to possess, and we have reason to believe that they will be found to exist in the exhibition of glass pipes in the Crystal Palace, Class I., No. 18, at the south-west end, where may be found numerous specimens, in lengths joined together and carried in every curve and bend likely to be called for in practice. We think these deserving the careful inspection of all who take an interest in the question of an improved supply of water to our towns and our domestic dwellings, and to an improved medium of conveyance for such water, rather than through pipes of lead.

A card placed beneath the specimens in the Exhibition affords a few short particulars, which we refrain from publishing, in the hope that our readers will visit the place for themselves, and endeavour to ascertain what progress has been made towards the fulfilment of the great Sir Robert Peel's prediction.

We have frequently been asked, what is the best mode of preserving fruit, and whether there are not chemical means of keeping it, so that it may be preserved fresh and wholly unchanged for a long time; either by placing it in contact with some substance which shall counteract its tendency to spoil, or by plunging it in some gas or liquid which will prevent it from decomposing. There have been a great many attempts to do this, but they have all been attended with but very partial success. Fruit, for the most part, consists chiefly of sugar, gum, starch, cellular matter, water, and a small quantity of albumen and gluten; but besides all these, it also contains certain other substances, such as colouring matter, and a small quantity of some highly fragrant volatile oil, to which the taste and agreeable smell of the fruit is due. The most changeable component of fruit, therefore, is the azotised matter, which is generally that which first of all commences to decompose; usually, too, air is necessary to its change, and consequently those fruits which have thick dense skins, dry and shrivel up, when they are kept, without being spoilt. In drying, of course they lose some portion of the volatile flavouring matter, but they also retain some, and they may be kept for a long time, without their either putrifying or fermenting. The more delicate and highly flavoured fruits, however, are not of this description; their skins are so porous and open, that they very soon allow the air to pass into the interior of the fruit, and consequently it is impossible to preserve them by drying.

The immediate consequence of air coming in contact with the pulpy matter of ripe fruit, is that the azotised matters begin to absorb oxygen, and decompose; then the sugar, starch, and gum are acted on; the flavour is rapidly destroyed, sometimes spirit is formed, the sugar simply undergoing the vinous fermentation; at other times, the change goes on more rapidly, and the fruit soon becomes putrid. All these effects may be easily observed, by watching the ripening of any of the common varieties of fruit. The drying up of ripe Grapes, which are left to hang with their skins uninjured, and the immediate change which occurs if the skin is injured or punctured, is familiar to every one. The rapid change which takes place in ripe Gooseberries, when the skins burst, and which, in the first instance, is a mere case of common vinous fermentation, is also well known. The injury which all fruit sustains from bruises, though it often does not produce the same effect, is yet in chemical nature very similar to that which occurs in the Gooseberry. The cause of the evil in all cases is the oxygen of the air; and the mode in which it acts consists in the skin or cuticle being destroyed or injured, so that the air finds an easy entrance through the damaged part. In the case of delicate and thin-skinned fruits, they are so porous that the air enters on all sides, as soon as they are fully ripe, and even though they are not in any way injured, and this constitutes the chief difficulty in preserving them.

The fresh juice of the Grape readily ferments, as soon as it is exposed to the air, but the juice of a Raisin or half dried Grape no longer has the power of doing so, because it contains too much sugar to ferment. A weak solution of sugar, under favourable conditions, soon begins to ferment; whilst a strong one is unable to enter into the vinous fermentation. It is in part, on this fact, that the common mode of preserving fruits by means of sugar depends. In making preserves, too, the fruit is heated, and heat, by rendering the vegetable albumen solid, makes it less likely to decompose. The preservative influence of heat on all forms of organic matter is well known; the value of heat in preventing the decomposition of food generally, was minutely detailed by Appert in 1810, for which he was rewarded by the French Government with a sum of twelve thousand francs.

But both heat and sugar, though no doubt very useful agents in the preservation of fruit, are very far from being quite satisfactory; and though, by their use, the fruit may be prevented from undergoing actual fermentation, yet more or less of the flavouring matter of the fruit is always destroyed or lost. What is wanted is a means of preventing the decomposition of the fruit, without the use of any substance which could injure its flavour, either by the addition of a new flavour or the destruction of the natural one. After what has been done already in the storing and preservation of some sorts of fruit, and the improved modes of keeping it which have been devised, we do not altogether

despair of a satisfactory mode of preserving the more delicate kinds being discovered, although most of the recorded experiments which have been made with that view are certainly not very encouraging. The experiments usually referred to on the preservation of fruit by chemical means, are some which were made by Dr. HENRY in 1776, and described in the fourth volume of Dr. PRIESTLEY's "Essays on Air." The fruit in these experiments was suspended in carbonic acid, so that it was kept in an atmosphere containing no free oxygen. A bunch of Grapes exposed to carbonic acid remained fresh and plump for six weeks, whilst a corresponding bunch placed near it in a similar vessel, containing common air, was quite mouldy in three weeks. A second experiment was made with some ripe and rather stale Strawberries, which had been gathered the day before; the following day those which were exposed to the air had lost their taste, whilst the fruit kept in carbonic acid, "had become more dry, but was fragrant and well tasted; their fragrancy was even thought to be improved." On the fourth day, those in air became quite musty and mouldy, whilst those in carbonic acid were some of them firm, and had still a moderate degree of flavour at the end of eight days.

In this experiment of Dr. HENRY's there are two points which were decidedly against the preservation of the fruit, namely, that the fruit was already stale at the commencement of the trial, and that the carbonic acid employed was not pure, but contained common air. A number of similar experiments have since been made, the general result of which has been, that though the fruit kept well, it wholly lost its flavour; but we do not think that there is any reason to despair of ultimate success. It is plain, from all the trials which have been made, that it is easy to prevent the decay or fermentation of fruit; the difficulty is rather to preserve its fine flavour, and prevent it from becoming tasteless and insipid. When an Apple is bruised, the part thus injured soon turns brown, decay commences, it becomes mouldy, and the whole fruit soon rots; and this decay easily spreads from one Apple to another. If a little hole is cut through the skin of a sound Apple, and a small piece of a rotten one is inserted under the skin, the sound fruit will soon be brought into a state of decay; but if this is done in a jar of carbonic acid, no such effect will take place—the sound Apple will remain fresh, even though there is a portion of decayed Apple in contact with it. The flavour of fruit is apt to be spoilt, not merely from the loss of the peculiar volatile oil which it contains, but likewise from the absorption of other volatile substances; for fruit of all descriptions has a very remarkable power of absorbing odorous matters of various kinds.

Amongst the many plans for preserving fruit which have been described, and which more or less depend in principle on the exclusion of air, such as packing it in close sealed vessels, wrapping in fine paper, covering the ends of the stalks with sealing-wax, or arranging it in boxes filled with thoroughly dry sand, bran, straw, Fern, or other similar substance, the greatest care in all cases must be taken that the packing material has no odour; for if it has, the fruit, besides losing a portion of its own natural aroma, will acquire some of the odour of the packing material, and the delicate flavour of the fruit, and consequently its value, will be destroyed. On the other hand, when fruit is preserved by cold, and especially when for this purpose it is gathered before it is perfectly ripe, it is often found that on removing it from the ice-house or cold well in which it has been preserved, though at first it has but little flavour, yet that on gently warming it and keeping it a few days, the flavour improves and decidedly increases. This and other similar facts may fairly lead to the consideration, whether the odour and flavour of fruit which has been preserved some time in carbonic acid, nitrogen, or hydrogen, and which has in consequence become deteriorated, is, in truth, really altogether destroyed; and whether it might not be possible to recover the whole, or at least a portion, of the lost flavour?

The absorption of manure, or rather the manner in which plants fed with very strong manures acquire a peculiar and often very disagreeable flavour in consequence; and also the curious way in which the odour of flowers is sometimes modified by the absorption of particular substances, are probably also examples of the facility with which vegetables absorb odorous substances. Concerning the formation of odours by plants, very little indeed is known. There are, however, a number of curious facts bearing upon the subject, and showing how volatile odours, closely resembling those secreted by plants, are sometimes formed in the most unexpected manner. Thus, for example, in the process of bleaching rags by chlorine for making paper, it frequently happens that the bleached pulp has precisely the odour of ripe Apples; this is evidently due to the presence of some substance formed by the action of the chlorine.

---

WE have lately received from Mr. VERSCHAFFELT, of Ghent, flowers of two tree Pæonies of admirable beauty. They were intended for exhibition in London, but would not keep for that purpose.

One was rosy pink, large, and uncommonly showy because of the very fine colour of the flowers. When full blown they measured 7 inches across; but in this state they showed quantities of stamens in the centre, and some of the petals, though all of good substance, were much longer than the others, giving the general aspect of the flower a somewhat ragged appearance.

The other was French white, shading off into rose at the base of the petals, and rather smaller, but more double and regular, and consequently more compact, holding together well, even after it had been cut a very long time. Both kinds were exceedingly handsome, as all tree Pæonies are. A well grown specimen ornamented with such flowers in even tolerable profusion must produce a magnificent display.

We understand that these were produced by Mr. CHARLES GOETHALS, a gentleman residing at Ghent. The darker kind, called Gloria Belgarum, is described in the "Journal d'Horticulture Pratique," as a seedling which, in 1844, had flowered for five successive years, and at that time was producing blossoms at least 10 inches in diameter; a single plant bearing seven of them. It would seem that they are now appearing in great abundance, Mr. VERSCHAFFELT having been able to forward four of them. Certainly these Moutans are among the finest we have ever seen.

## ORCHIDS FOR THE MILLION.—No. IV.

By B. S. WILLIAMS, gr. to C. B. WARNER, Esq., Hoddesdon.

TREATMENT OF FRESH-IMPORTED PLANTS.—These, when newly imported, should be sponged over every leaf and bulb, and all the old decayed parts taken away. There are many insects that will harbour in them, such as the cockroach, and the different kinds of scale, which are great enemies. After they are clean they should be laid on dry moss and placed in some shady part of the house, where it is rather cool and dry. Too much light, heat, and moisture at first is injurious to them. The moss should be gradually moistened, and when they begin to grow and make roots they should be potted or put on blocks or in baskets, but care should be taken not to have the pots too large; for over potting is dangerous.

As soon as they begin to grow, those which come from the hotter parts of India should be put at the warmest end of the house, but they should not have too much moisture at first: those which come from the more temperate regions should be kept at the coolest part of the house, and they should not be allowed to stand under any drip, as this frequently rots the young shoots as soon as they appear. Such plants as Vandas, Saccolabiums, Aerides, Angræcums, Phalænopsis, are fastened on blocks as soon as they are received, and I place them so that the plants hang downwards, in order that no water may lodge about them, till they begin to grow and form new roots: this is much the safest mode of treating these valuable Orchids. This is also the mode adopted by Mr. Rollisson of Tooting, who is one of the most successful growers of these plants.

Mr. Warner's house stands north and south; it is 60 feet long, with a span-roof, 24 feet wide and 13 feet high; in the centre is a glass division, so as to make two houses, one for those that come from the warmer parts of India, next the boiler, and the other for those which come from cooler climates, and which require less heat and moisture. There are two middle tables, each 4 feet 7 inches wide, 2 feet 8 inches high, for plants, and a path 3 feet wide runs up the centre of the house. Along each side are slate cisterns for holding rain-water, and under these are three rows of 4-inch hot-water pipes; on the top of the cisterns is a table for plants, and up each side of the house there is a path 3 feet wide. York stone suits best for the floor of the house, because it holds more moisture than slate, but slate is best for tables; the latter should be made with a ledge, so that they can hold water during the summer, but in winter they should be dry: the water should never be permitted to be long on the shelves at a time. I change it once a week. I put a layer of small stones in the water to set the pots on, and in this way a good drainage is maintained.

For heating an Orchid-house nothing is better than hot water; three rows of 4-inch pipe should run round the house, and two round each centre table, and there should be an open tank in the centre, with means of turning off the water, when moisture is not required. Small iron ventilators, made to open and shut, should be inserted in the brickwork on each side, so as to allow the heat and moisture to pass into the house when required. At each end of the middle tables there should be a hole, provided with a sliding door, large enough for a man to enter under the tables, to examine the pipes at any time when the latter might be out of order.

GLAZING.—The laps here are close. The squares are 3 feet long and 11 inches wide, sheet glass, 22 oz. to the foot. On both sides there should be upright sashes, containing glass 15 inches high and 11 inches wide. The south end of Mr. Warner's house is glazed, and the north end is brickwork, for climbing Ferns and Orchids. Each sash-bar of the roof should have a small groove in it, to allow the water to run down to the bottom of the bar, where a small zinc gutter should be provided to catch the water; if this is not attended to, the latter will drip on the plants, which is very injurious to them.

VENTILATION.—This is of great importance; for if cold air is allowed to pass among the plants, they will not thrive, and all care which has previously been bestowed on them will be in vain. Means of ventilation should therefore be provided for, near the ground, close to the hot-water pipes, in order that the air might be warmed in entering the house. In the houses here there are three ventilators on each side of each house, two at the south end in the brickwork, and two at the north end near the top of the house. The ventilating shutters are made of wood, about two feet long, one foot wide, and hinged; there should be two glass ventilators at the south end near the roof, as the top lights of the house are not made to slide.

The best material for shading is canvass, and there should be blinds on each side of the house, with a strong lath at the top to nail the canvass to, with a roller at the bottom. The canvass must be nailed to the roller, but care should be taken in doing this that the blind should roll up regularly from the bottom to the top; I never, however, allow the canvass to be down, except when the sun is powerful, for I find that too much shade is injurious to most kinds of Orchids. The blinds will also be useful in the winter season for covering the house during a frosty night, being a great protection to those plants that are near the glass. It is advisable to have a covering on the top of the house for the blinds to be rolled under, in order to keep them from being exposed to the wet.

Slate cisterns are very important in a house for collecting the water which falls on the roof. We have cisterns on each side of the house over the hot-water pipes, which keep the water at the same temperature as that of the house.

## BRITISH SONG BIRDS.

(CAGE BIRDS, No. 17.)

No. XXXIII.—While my favorite, the nightingale, is yet with us; and 'ere his sweet voice ceases to be heard in our latitudes—in a few days more, parental cares, alas! will silence him for the season,—I am most particularly anxious to clear him, once and for ever, of the ridiculously false charge of his being a "melancholy bird," and his song indicative of "grief." Surely not,—surely not, ye lovers of melody. Whence this strange and unfair reading of my "pet's" musical voice, I know not. When HE sings, all nature is "happy." When silence prevails throughout the night, and HIS love-chant is *not* heard upon the breeze,—are WE not "melancholy" from the loss? Assuredly, yes.

It is a strange fact, that many of our best poets have ranged themselves together on the dark side of this lovely bird. Pollok, for instance, whose inspired powers none can dispute, apostrophises the nightingale thus:—

> "*Sad* bird! pour through the gloom thy *weeping* song;
> Pour all thy dying melody of *grief*,—
> And, with the turtle, spread the *wave of woe*."

Thus gloomily, too, sings our sweetest of bards,—Milton:—

> "Hail, lovely nightingale!
> Most musical, — *most melancholy bird!*"

Indeed, nearly all the Heaven-born poets follow, as if by mutual compact, in the same morbid strain; which to me is marvellous. Let us charitably hope, out of deference to the taste of the older poets, that our modern nightingale is quite a different bird from that immortalised in days of yore. It must be so. Let me confirm the thought, by quoting from one of our later poets, Coleridge. *His* ideas of love and music—sweet association!—are very closely akin to mine:—

> "List! to the '*merry nightingale*,'
> Who crowds, and hurries, and precipitates
> With fast thick warble, his delicious notes;
> Fearful, lest that an April night
> Should be too short for him to utter forth
> His love-chant,—and disburthen his full soul
> Of all its music!"

This view of our hero is graphically correct, and ought to be the popular one,—for cannot we all aver that never was bird more merry, bird more happy, bird more affectionately joyous?* Unlike us erring mortals, who

* In a little book, translated from the German by Sarah Austin, and entitled "A Story without an End"—a book, by the way, which every body should get by heart—we find a young and noble child wandering about, in ecstatic innocence and delight, among birds and flowers; and some of his pleasures are very delightfully recorded. As they refer particularly to the nightingale's joyous habits, and prove him to be anything *but* a melancholy bird, they could not be introduced at a more apposite season. "There was no end to the Child's delight. The little birds warbled and sang, and fluttered and hopped about; and the delicate wood-flowers gave out their beauty and their odours. Every sweet sound took a sweet odour by the hand, and thus walked through the open door of the Child's heart, and held a joyous nuptial dance therein. But the nightingale and the lily of the valley led the dance; for the nightingale sang of nought but love, and the lily breathed of nought but innocence; and he was the bridegroom and she was the bride. And the nightingale was never weary of repeating the same sentiments a hundred times over, for the spring of love which gushed from his heart was ever new; and the lily bowed her head bashfully, that no one might see her glowing heart. And yet *the one lived so solely and entirely in the other*, that no one could see whether the notes of the nightingale were floating lilies, or the lilies visible notes,—*falling like dew-drops from the nightingale's throat*. The Child's heart was full of joy, even to the brim." * *—No doubt it was. That boy was one of Nature's own children.

may indeed be said to "mope," when we are affectionately joyous,—(being subject to necessary and highly proper conventional observances,) Philomel, recognising no such trammels, gives way to unrestrained gaiety of spirit; telling us in all the expressive language which music alone can so happily convey, and liberty alone inspire,—the thoughts of his heart, the rapture of his soul. *This* is courtship, if you please. But as we are pledged not to be poetical, let us travel onward.

In order to keep your nightingales in good health, and cheerful withal, be careful to provide them with fresh, clean water, every morning,—so that they may take their bath regularly. When your birds are tame, and used to be waited on, you may open the door at the back of their cage, and hang thereon a square mahogany bath, similar to, but, of course, a size larger than the one I recommended for canaries. Into this they will jump; and so thoroughly will they disguise themselves by their ablutions, that recognition would be impossible. They will spend some little time in this aquatic diversion; and when tired, they will withdraw. Some considerable period will then be occupied in arranging their feathers, and completing their toilet. This done, they will commence singing merrily.

All these little *minutiæ* require to be dwelt upon; for unless such delicate attentions, as I have hinted at, be paid to your birds, and unless they see your delight consists in studying their happiness, that cruel demon—"jealousy," will destroy all their serenity of mind. I have had so many opportunities for verifying this, that I speak oracularly. Nor is it to be wondered at, that birds of such extraordinary vocal powers *should be* so "touchy,"—so alive to every slight. Accustomed as they are to rule the majesty of night, and hold the feathered race spell-bound by their nocturnal melody, it is no more than natural that they should like to have their supremacy duly acknowledged in the day-time also.

If you hang them out of doors, let it be in some snug corner, over-arched by a widely-spreading tree. Sheltered from observation—these birds love retirement, and shun the vulgar gaze—they will, towards evening, treat you to some lovely music. It is, however, advisable to take them in-doors before dusk,—lest, hearing their strains taken up, and repeated by their brethren in a state of freedom, they should pine for liberty, grow sulky, refuse their food—and die.

The nightingale revels in a treat of ants' eggs; and is remarkably fond of elderberries. I should, therefore, recommend one or two of these trees being planted in your garden. They grow rapidly, and bear freely. As, however, they are decided enemies to all other trees, and carry pestilence in their wake—plant them in an out-of-the-way corner, where nothing else will grow. A nightingale is also very fond of flies. He will take them eagerly from between your thumb and finger, and swallow them, one after the other, by the dozen. And here let me give my readers a caution.

In the summer season, when flies haunt us, and render our lives burdensome—this is the case very frequently in my locality—it is a common practice to kill them with a mixture of Quassia-root and sugar; the former made into a decoction with boiling water, the latter being added by way of a lure. The effect of the Quassia is first to stupify them and then to kill them. They sip it cautiously, and afterwards decamp, to die more at their leisure. Now for the evil of this. Your nightingales, ever on the look-out to capture as many flies as they can outwit, pounce on every one of these inebriated victims that blindly falls in their reach; and when swallowed, the poison is imbibed at one and the same time. I once lost two splendid birds in this way, and have never forgiven myself for my culpable folly. It will, however, be some reparation, if by this warning I prevent any further mischief. Now that the "Fly papers" are invented—and fatal engines of destruction they are—Quassia may be altogether dispensed with; though, let me add, the poor flies undergo, when chained to these resinous papers, agonies indescribable. The tortures of "the Inquisition" could hardly be greater. Cicero says—"*Cavendum est, ne major pœna quam culpæ sit.*" I hardly think the inventor of the "Fly papers" ever studied *this* rhetoric. With him, doubtless, "Ignorance is bliss;" and he would think it "folly to be wise," under the circumstances. *William Kidd, New-road, Hammersmith.*

## ENTOMOLOGY.

### The Large Pear Tree Astyages.

My attention was directed, at the end of May, 1850, to the state of several Pear trees trained against a wall, facing the east, in the gardens of the Horticultural Society, at Chiswick, which at that time were deplorably infested by myriads of small caterpillars, each enclosed in a blackish nearly cylindrical moveable case, although nothing of the kind had been observed in former seasons. The leaves exhibited large brown patches wheresoever they were attacked by the insects, and it was easy to ascertain in what manner this effect had been produced, as well as to be convinced that were the trees to be subject to similar attacks in subsequent seasons, they would certainly be thereby destroyed, the discoloured parts of the leaves being unable to perform their proper functions.

The cases formed by these caterpillars when full-grown, are nearly cylindrical, about half an inch in length, and of a diameter sufficient to enclose the bodies of the caterpillars, each end being open, the lower end circular, out of which from time to time the caterpillar protrudes its head and the fore segments of its body, and the upper or hinder extremity, which is partially closed, being elastic, but which the insect from time to time pushes open, in order to discharge its excrement; the case is rather narrowed at the mouth, so that the larva, although it protrudes the anterior part of the body with the greatest facility, is not able without difficulty to draw itself entirely out of its case, owing to the middle segments of its body being more dilated, as well as to the strong muscular power of the prolegs at the end of the body, which have the hooks set on so as to prevent the insect being forcibly pulled out of its case. The caterpillar is of a pale dirty fleshy-brown colour, the head is small and black, the upper surface of the first segment, behind the head, is black, horny, and shining, having a slender pale line down the middle; the sides are fleshy-coloured, with a small black dot; the second segment has a small double black triangular spot near its hinder margin above, and a small black dot on each side above the legs, as is also the case with the third segment; the following segments are fleshy, destitute of transverse rows of reflexed hooks, the sixth, seventh, and eighth having on the under side a pair of small tubercles, armed with very minute hooks, serving as prolegs; the terminal segment of the body is covered by a black scaly patch, and its underside armed with a pair of prolegs. When the caterpillar wishes to change its position it protrudes the front part of its body, and then advances forwards by means of the six feet attached to the segments following the head. On the slightest alarm, however, it instantly withdraws into its case, the mouth of which is brought into contact with the surface of the leaf, standing upright at right angles, its general position when walking being more oblique. When it has fixed upon a spot to commence feeding, it does not, like most other case-bearing larvæ, gnaw the edge of the leaf, but carefully forms a circular orifice in the cuticle of the leaf (generally the lower one, as the insect prefers the underside of the leaf for its ordinary abode); its instinct instructing it not to bite entirely through the leaf, but only through the surface on which it has taken its place; it then slightly attaches the mouth of its case to the edges of the orifices it has made in the cuticle, and commences feeding upon the parenchyme alone; it is thus enabled by degrees to introduce its head and the fore segments of the body into the cavity thus made between the two surfaces of the leaf, and thus we find the habits of the ordinary leaf-mining caterpillars (which are entirely enclosed between the two surfaces of the leaf), combined with the external wandering habits of the majority of caterpillars, a peculiarity possessed, so far as I am aware, by no other lepidopterous larva. When thus fixed, the larva mines the leaf all round the spot where it has fixed its case, to the diameter of half-an-inch or rather more; in fact it protrudes the head and front of the body out of its case, as far as it can, leaving the hind part, however, within the case, so as to make good its retreat, when necessary. When it has consumed a circular patch of parenchyme in this manner, it withdraws itself into the case, detaches the mouth from the circular orifice, and crawls off to a distance sufficient to enable it to perform the same operation in another part of the leaf, the blisters thus formed generally becoming confluent at the edges.

When the insect has acquired its full size, it leaves the leaf, to fasten the mouth of its case to the trunk of the tree, in some sheltered situation, and there undergoes its transformations, the moth making its appearance in the middle of July following. Singular as it may appear, this moth is one of our rarest micro-lepidoptera, and the specimens which I reared proved acceptable to most of our entomologists. It proves to be the Astyages (or Coleophora) Hemerobiella; its body and fore wings are of a greyish white colour, varied with very minute black specks, having an indistinct spot considerably beyond the middle of the fore wings; the hind wings are of a browner tint, and the hind legs are very hairy; it measures rather more than half-an-inch in the expansion of the fore wings.

Anxious to clear up several points in the history of this interesting insect, such as the mode of formation and enlargement of its case, the situation where the eggs are deposited, &c., I again visited the Horticultural Gardens towards the end of the present month of May, and was surprised to find scarcely a single specimen of the larvæ upon the trees, where last year they had swarmed to such a singular extent. This periodical development of particular species of insects, to an extraordinary degree, is one of the many phenomena of insect life which require investigation. In the present instance we can only conjecture that the deposition of eggs by the female moths was in some way or other prevented, or that the eggs were prevented from hatching; or, lastly, that if hatched, the young larvæ were in some manner or other destroyed as soon as hatched; the solution of these suggestions can, of course, be only obtained by continued investigation of the habits of the species.

As the cases are very conspicuous, vast numbers may be destroyed, if again found similarly numerous, by employing children to hand-pick the trees. *J. O. W.*

## Home Correspondence.

*The Trentham Machine for Destroying Weeds by the distribution of Hot Water and Salt.*—I have anticipated the issue of the *Gardeners' Chronicle* for the last two or three weeks with much interest, thinking that some article or articles might appear amongst the "Home Correspondence" commenting upon this very original piece of economy. It may be deemed presumption on my part to differ with you on a subject upon which the heavy artillery of a leading article has already fulminated (and it may be that you have in store a reserved battery for the unlucky wight who shall question the merits of the machine—be it so); but do me the favour to believe that no discourtesy is intended, and that what I say upon the matter is in perfect good feeling, and dictated only by a regard for the holy and beautiful principle of truth. "Magna est veritas et prevalebit." Premising thus much, I will only say that, having given the subject the most deliberate consideration, I have come to the conclusion that, when all the contingencies are calculated, there can be little economy, and that the little there may be is of that kind which no really philanthropic man of fortune would care to have exercised for him—a paltry saving of a sum of 80*l.* a year, to throw out of employment a few poor boys, old men, and women, in a most populous district, where their only ultimatum is the union workhouse, to which the wealthy proprietor must pay his quota; or the prison, to which idleness is the high road. I envy not the man who lives but for himself, and who would build up his own reputation with cash (not trash) "wrung from the hard hands of peasants." When we think how small an amount 80*l.* per annum is, and how limited a sum it would be thought in the purchase of a horse, a picture, or an article of vertu, and put it into the balance with the moral good it must do, and the social happiness it must effect, in employing the poor, will any liberal or well-regulated mind say that such an invention is in accordance with the age, or at all worthy of the enlightened and high-minded spirit in which the Exhibition of 1851 has been conceived and carried out. I think that gardeners have a duty to perform to their labourers, as well as their employers, and while I would scrupulously insist upon the employed doing justice to their master, I should at the same time endeavour to make them feel that the nobleman or gentleman for whom they worked did not regard them merely as a burden from which he would be free. Allow me, through the medium of your columns, to ask Mr. Fleming the following questions:—Has he not had more machines than one? Was not the first one too expensive? and what did machine No. 2 cost? Has he not killed his Box-edgings to some extent in the application? It is admitted that the machine must not go near the edges, a part of the walk where the weeds always grow in the proportion of three to one with the centres. The happy accident of the man "who happened to be at work" near the spot to help the boy, may be very well at Trentham, but in other places the men may be fewer and "far between" (rather awkward this). Mem.: 1 man is equal to 3 boys' wages per diem—thus, 1 man at 1*s.* 6*d.*, equal 3 boys at 6*d.*, and each boy will weed as much as the man. The machine costs nothing, coal costs nothing, salt nothing, and the thousands of gallons of water which deposit half an inch thickness of salt is raised without labour, or if not so, how is it? The recommendation to place ridges of sand to protect the edges appears to me most absurd—clay would be more appropriate. The water would trickle through directly, and the laying down this, and taking up, is no small labour, and must leave the walks in a "pretty pickle." The luxuriant Dandelions must imply a state of things wide of the economic point to begin with, and the dead roots washed to the sides of the walks by the rain (and, of course, left there on account of the expense), must have rather an odd effect; perhaps it is picturesque, and—but I fear I have got into hot water, and shall be pickled. *Henry Bailey, Nuneham-park, Oxford.*

*Asparagus.*—I have six beds of Asparagus, which have been planted, I should say, 30 years, and perhaps more. The plants are not spread regularly over the beds. In autumn last I raked all the soil off the plants into the alleys, covered them with good rotten manure about 2 inches thick, and on this replaced the soil to about the same thickness out of the alleys. This spring I applied a moderate coating of salt, and I must say that they have succeeded satisfactorily. My employer desires me to cut (to use his own words), "all before me;" but this I have objected to, and for the following reason: some of the plants are pushing weakly, as is the case in every bed of Asparagus, and by cutting the weaker one year, it is my opinion they will be weaker still the following

season, and that in two or three years I should not be able to procure a dish of Asparagus fit to be presented at table. Why not leave well alone, and only cut the strongest? Now, who is right in this matter, me or my employer? *Cymro.* [You are quite right in permitting the weak plants to grow.]

*Gardeners' Newspapers.*—I have had several gardeners here lately who subscribe to a certain gardening paper, requesting to know what is done with the overplus money which was intended for gardeners and their widows. Not one of those men are aware that this paper changed hands two years ago, and that those who had shares in it lost all; nor was even a notice sent to them upon the occasion of its breaking up. *A Disappointed Old Cabbage.* [We know nothing about the matter.]

*Forcing Strawberries.*—The following is the mode of treatment to which my Strawberries have been subjected. As soon as the plants were well rooted, I raised them carefully with a small ball, and potted them into the fruiting pots at once. I never layer the runners, as is usually done, as I consider that practice to be only waste of time. I would, however, recommend the plants to be potted in damp weather; I use 6-inch pots, and I only pot one plant in each pot. The soil I employ consists of two parts of Wimbledon loam, one part well rotted dung and charcoal, the latter in proportion of one to six; I also place a good portion of charcoal in the bottom of the pots, so as to ensure good drainage. The loam should be mellow, and in a rough state. After the plants are potted, I remove them to a south border, on which I have spread some coal ashes and quick lime, to prevent worms from entering the pots; I give plenty of manure water during the period of growth; and also when the fruit is swelling. In making the dung water, I employ only sheep droppings for the purpose; I would recommend the water to be prepared a considerable time previously to being used, and when used to be clear; I stack my plants in winter in coal ashes; but care must be taken that they do not then become too dry. At forcing time, I put them in a pit, with a gentle bottom heat, and remove the glass at all favourable opportunities until the fruit is all set; then I give them a shelter at the back of my Vineries, where they get plenty of heat and air. I have this season fruited a thousand plants under the above treatment with uniform success. The kind is Keens' Seedling. *John Kenny, Copse Hill, June* 4.

*Hardy Eucalypti.*—Perhaps it may be interesting to know that a variety of Eucalyptus grows in Essex in the open ground. The plants were raised from seed sent here by the late Dr. Norris, of Hackney, in 1842. They were kept in pots for two years. They were then planted in the American garden, where five are still alive and growing freely. They have flowered these last three years, and are showing bloom again this season. The largest is 25 feet high, and girths at 1 foot from the ground, 1 foot 3 inches; ditto 4 feet—10 ins.; ditto 8 feet—8 inches; ditto 12 feet—6 inches. They certainly are interesting objects growing amongst other trees, and would be more so were they able to support themselves; but I am obliged to prop them up with three rails each. I think, however, that after this season some of them will be able to support themselves. In 1847 or 1848 we had a sharp winter; the trees were then released from their supports, and allowed to blow about amongst the Rhododendrons. During the same winter one that was trained to a west wall was destroyed by frost; since that period the standards have been kept to their supports. Braxted Park is about five or six miles from the sea, but I am unable to say how much it is above its level. *George Taber, Gardener to Chas. Dulane, Esq., Braxted Park, Witham.* [The leaf sent with this corresponds with that of Eucalyptus coriacea from Van Diemen's Land; but the absence of flowers prevents its exact determination.]

*Cloth of Gold Rose.*—I am told that when this Rose was first introduced, Mr. Rivers gave a very flattering description of it. Many on that account purchased it, but it never realised their expectations, for they could not flower it at all satisfactorily, and some even termed it "an imposition." I have, however, much pleasure in testifying to the correctness of Mr. Rivers' statement. The plant here covers 176 feet of wall, and is ornamented with nearly 200 flowers, 30 or 90 being open on it at one time, and each bloom measures from 12 to 15 inches in circumference. This plant stood for some years without ever showing a flower, or even growing to any extent. I soon, however, discovered that this Rose, like all its tribe, wanted strength to flower well. I, therefore, about a year ago had all the old soil removed from the roots, and a large quantity of strong loam and dung introduced in its place. This caused it to grow very vigorously; I then had all the strong shoots nailed in full length, and the weak ones cleared away. It received no other pruning whatever, and every one who will adopt the same means will find that every bud will burst into flower—in fact, it is my employer's, as well as my own opinion, that this Rose, for size of flower, colour, and scent, stands without a rival in its class; it is now in full bloom, although a little past its best. *D. Kidd, Garnstone Park, near Hereford, June* 4.

*The Calceolaria.*—It is stated that the Calceolaria cannot be grown successfully from cuttings on chalky soils in the south of England. Having had considerable experience in its culture on soils of various kinds in different parts of the country, especially in the south, I may mention that I have experienced no such difficulty as Mr. Gilbert speaks of at p. 341. Ah, "G. H.," Mr. Gilbert might well involuntarily exclaim, if both are situated in localities where leaf or vegetable mould is not obtainable; but I presume there are few places in which the Calceolarias are cultivated where such is the case, even in districts where chalk abounds; and this mixed with some of the best surface soil, answers every useful purpose. I have found this treatment, with frequent applications of liquid manure, to answer admirably, even in what might be termed chalky districts, and I consider that if Mr. Gilbert were to follow the method above described he would be enabled to keep his plants in such health as to procure abundance of cuttings from them. *George Gorrie, Hassop.* —— Having a collection of Calceolarias in cold frames, in the spring of 1846, I took a portion of them and placed saucers under them containing liquid manure, for the purpose of testing its advantages, if it had any. The pots were well drained, so that the ball of soil was quite clear of the manure-water. I watched their progress with much interest, and soon perceived that they assumed a more vigorous appearance than those not so treated, and the flowers likewise well repaid the extra labour bestowed upon the plants. I have followed the same plan ever since, and with much success. I should not omit to mention, that both the plants experimented upon, and the others, occasionally received waterings of weak liquid manure. *Omega.*

*Penny Savings' Banks.*—In reference to the Penny Save, Penny Get Club, alluded to at page 310, the plan is the following:—In my school is a box with P. S. P. G. painted on the top, in which there is a slit to admit pence being dropped into it. Each child wishing to become a member of the Club, receives from me a card, of which this is a specimen. On this card I write the date and the money put by the child into the box. The child keeps the card and I keep a book in which I enter the name of each depositor, and his or her account. The rector (Rev. Francis Clerke) keeps the key of the box, and occasionally compares the cards, the book, and the money in the box, and certifies the correctness of the card and book accounts with the money in the box. The money he puts into the Savings' Bank, at Banbury, where it receives interest. Once a year this interest is divided amongst the depositors according to the amount of their respective accounts. As soon as a depositor's account amounts to 5*s.* 3*d.*, such depositor's money is taken from the general account, and placed in the savings' bank, in his or her own private account. In description, this may appear complicated and troublesome, but in practice it is surprising how little of either it is. By this plan all the money received during the year, being put into the savings' bank in one account, obtains interest, which is divided proportionately amongst all the depositors, and as soon as any child has 5*s.* 3*d.*, he or she has a private account in the savings' bank, which bears interest. There are no honorary members, and the children receive nothing more than the interest of their own money, with any present the rector may please to give them at Christmas. It teaches them provident habits, and they value the plan very highly. I have four children who have been members from the commencement. They have deposited upwards of 2*l.*; and I can answer for it, had not the rector, who is continually contriving something for the benefit of his parishioners, who established this "penny save, penny get club," that instead of their being worth upwards of 2*l.*, they would not have had two pence. They are, since they have had a bank book, equally as ready to put their pence into the "penny save, penny get club," as they used formerly to be in spending it. The present number of members is 27, and they have deposited, chiefly in pence and half-pence nearly the sum of 10*l.* *William Griffin, Eydon, Daventry.*

*Winter Peas.*—In the article at p. 324, on Foreign Gleanings, M. Masson says, "the Russians keep the Peas through the winter. We ourselves tasted Peas thus kept, and, to our taste, they were as good as any we ever met with." Will any of your correspondents be so good as to inform your readers how the Peas are to be treated, so as to be thus kept through the winter? By so doing, they will much oblige *F. H. S.*

*Night blowing Cereus (C. grandiflorus).*—This delightful plant, which has for many years past bloomed profusely here, was last evening quite an object of admiration. No less than 17 fully expanded blossoms were open on it at one time. The flowers, which are very fragrant, began to expand about 6 o'clock, p.m., and by 8 o'clock they were fully developed. The plant occupies a pot 14 inches in diameter, and has produced annually between 20 and 30 flowers, for these last 5 years. *Joseph Nickson, gardener to Viscount Middleton, Godalming.*

*Hint to Advertisers*—Will you have the kindness to suggest to Messrs. Francis and others, who advertise, thus late, the sale of bedding plants with prices attached, the necessity of doing so a little earlier another season, as most persons, like myself, have long since made their purchases. I have lately been buying plants at 4*s.* and 6*s.* per dozen, not "strong and vigorous," but the very worst I ever put into the ground; whereas it appears I might, had I known it, have purchased the same description of plants, vigorous and good, for half the sums. *An Old Subscriber, June* 2.

*Yew Hedges.*—There is something the matter with my Yew-tree hedges. The leaves are falling from the more compact parts, and the dead twigs look very bad and are covered with an unusual quantity of cobwebs; no insects are to be seen. Where the plant is not pruned nor confined in a hedge, it is quite healthy. *Yew.*

*New way of Cooking Potatoes after the 1st of April.*—After this date, Potatoes ought to be peeled at night for the 1 or 2 o'clock dinner, and for late dinners any time before 9 in the morning. I have repeated this experiment many times, and the improvement in the quality of the Potato is very great. It is well known that, owing to the inherent nature of the Potato, it will push in spite of every precaution to stop growth, leaving the tuber very spongy, and with much of the water extracted out of it. By peeling and steeping in cold spring water for ten or twelve hours, the pores of the cells become filled, however limpy the tuber may be; and in the process of boiling, this fresh water is again discharged, taking with it all bad flavour, as well as partly removing the dark spots which are often found in Potatoes. I tried them steeped in salt and water, thinking that in boiling the salt would remain in the cells, which it did, and gave the Potato a better flavour, but the salt turned the outside very brown, and did not look well. I have also steeped cut sets, which in twelve hours became firm; and, like steeping seeds, no doubt the practice would have a beneficial effect upon late planting sets. Water will, however, not penetrate through the tough skin of a whole Potato. *James Cuthill, Denmark Hill, Camberwell.*

*Beehives.*—There is a hive in the Exhibition in Hyde-park, numbered 208 A, Class 9, by Mr. Hayes, Enfield Highway, as a new invention; but as I myself, and some friends, had tried the principle long since, I found upon reference to the *Gardeners' Chronicle* for November, 1844, that a person named Smartt, of Enfield, introduced it. I refer to the plan now to prevent, probably, much disappointment, as it proved an entire failure, and was afterwards admitted to be so by its inventor. The principle consists in having two floors, one 3 inches above the other, the hive case being 30 or more inches long. On the upper floor is placed a stock of bees over a large hole, with smaller holes on each side for glasses. The great objections are, that the honey in the large 3-inch division is useless to the bees, and cannot be taken by the master; and as the bees keep only in the stock hive in winter, the other becomes mildewed and mouldy in nine cases out of ten, creating serious disease among the inmates. *Charles Wildman, London.*

## Societies.

LINNEAN ANNIVERSARY, *May* 24.—The President in the chair. The Secretary read a short notice of the members who had died during the year. Of these, 17 were Fellows, three foreign Fellows, and one Associate. The Treasurer read the cash report, when it appeared that there was only a few shillings difference between the expenditure and income of the last and the previous year. Among the presents on the table, was the 2d part of Dr. Hooker's Rhododendrons of the Sikkim Himalaya, and the splendidly illustrated work on the Victoria regia. Both were presented by the publishers, Messrs. Reeve and Benham. The members present proceeded to ballot for the Council and officers for the ensuing year, when Robert Brown, Esq., was re-elected President, W. Yarrell, Esq., Treasurer, J. J. Bennett, Esq., Secretary, and Richard Taylor, Esq., Assistant Secretary. The following five members of the Council were removed:—F. Boott, Esq., M.D., E. Forbes, Esq., C. M. Lemann, Esq., M.D., E. Newman, Esq., and Sir G. T. Staunton, Bart.; and the following five elected into the Council:—G. Busk, Esq., Lord Goderich, S. Hanley, Esq., J. D. Hooker, Esq., M.D., and J. Miers, Esq.

*June* 3.—The President in the chair. J. S. Lowell, Esq., was elected a Fellow. A letter was read from Professor Treviranus to Dr. Wallich, inclosing several letters of the botanist Schreber, whose life and writings had a short time since formed the subject of a communication from Dr. Wallich to the Society. Mr. Westwood stated that he had received further intelligence of the wingless bird which he had described at a former meeting, as an inhabitant of Lord Howe's Island, of its being found on a spot called "Cato's reef." Mr. Newport gave an account of his recent researches upon the embryology of the frog, and stated that his recent researches had quite confirmed all the results he had arrived at in his paper read before the Royal Society last session. The reading of this paper led to a discussion, in which the President stated that although he was not able to confirm Schleiden's view of the pollen cell becoming the new plant, he had ascertained most certainly that the contact of the pollen cell with the ovule was necessary to the growth of the embryo.

CALEDONIAN HORTICULTURAL, *May* 10.—A great many fine plants were produced on this occasion. The prize of two guineas, offered for the four finest Shrubby Greenhouse Plants, was gained by Mr. Reid, gr. to Professor Syme, with fine specimens of Pimelea linifolia, Leschenaultia formosa, Eutaxia myrtifolia, and Acacia grandis. For the finest Rhododendron, the prize was awarded to Mr. Crocket, gr. to Colonel Ferguson, for R. formosum. The prize for the four finest Stove Plants was gained by Mr. Ritchie, gr. to W. M. Innes, Esq., who produced large specimens of Gesnera splendens, Begonia coccinea, Epiphyllum Jenkinsoni, and Euphorbia splendens. The award of one guinea, offered for the four finest Cape Heaths, was gained by Mr. Reid, with Erica aristata major, Linnæoides superba, propendens, tubiflora, and elegans. A second prize was awarded to Mr. Crocket, for Favoides elegans, intermedia, Cavendishii, and vestita alba. For the finest flowered speci-

men of a trained perennial climbing plant, the first prize was awarded to Mr. Reid, for Tropæolum tricolorum, pyramidally trained; and a second to Mr. Thomson, gr. to Mrs. Balfour, for Tropæolum tricolorum grandiflorum, trained on a balloon-shaped trellis. The prize of one guinea, offered for the two best flowered specimens of Indian Azaleas, was gained by Mr. Reid, with fine plants of Gledstanesi and lateritia grandiflora; and a second prize was voted to Mr. Ritchie, for Prince Albert and Optima. There was a good competition in stage Auriculas, and two prizes were awarded; the first to Mr. Sanderson, for Headley's Conductor, Fletcher's Mary Ann, Grime's Privateer, Coldham's Navarino, Oliver's Lovely Ann, and Dean's Regular; and the second to Mr. Foulis, gr. to J. Tytler, Esq., for Campbell's Robert Burns, Stretche's Alexander, Millar's William Pitt, Tranter's Constellation, Moor's Violet, and Barr's Flora. Culinary Vegetables: The first prize was awarded to Mr. Anderson, gr. to the Earl of Stair, whose collection embraced 25 varieties, including excellent Kidney Beans, Mushrooms, Cucumbers, &c.; the second to Mr. Thomson, gr. to R. S. Wilson, Esq., who sent 32 varieties; and the third to Mr. Pender, gr. to D. Anderson, Esq., who sent 28 varieties. The prize for Strawberries was awarded to Mr. Pender for three pots of Keens' Seedling, well fruited. The award of one guinea, offered through the Society by Messrs. James Dickson and Sons, for the six best Cinerarias, was gained by Mr. Mitchell, gr. to Lady Keith, with fine plants of Carlotta Grisi, Cerito, Newington Beauty, Edmondsiana, Angelique, and Delight. A second prize was voted to Mr. Ritchie for Cerito, Lady Prudhoe, Climax, Pauline, Angelique, and Newington Beauty. In addition to the articles for competition there was a rich display of productions sent for exhibition only, and for these extra awards were made and thanks voted, according to circumstances. Messrs. Dickson and Co. sent a fine selection of hard-wooded and other greenhouse plants, including Azaleas and Heaths, and a specimen of Chorozema Lawrenceanum; also a box of seedling Pansies. Messrs. James Dickson and Sons also sent exotic plants, including Cinerarias, a light-coloured Rhododendron, and a species of Lachenalia. Messrs. P. Lawson and Son exhibited a selection of greenhouse and other plants, including Pelargonium erectum, Trichopilia tricolor elegans, Calceolarias, Ferns, and Alpines. Mr. Carstairs contributed a number of interesting productions, among which was a fine plant of Azalea ovata in flower, Rose Géant de Batailles, and a stand of Fairy Roses in miniature pots, two bouquets, and 25 stalks of Asparagus weighing 37 oz. Mr. R. M. Stark sent Heaths, Pimeleas, Chorozemas, &c.; and Messrs. Downie and Laird contributed a plant of the new Pentstemon cyananthus in flower, several beautiful Azaleas, and Pansies in pots. Mr. Methven sent a good selection of greenhouse plants, including Heaths, Epacris, &c., and a new seedling Rhododendron. Mr. Lightbody exhibited a collection of stage Auriculas, which were deemed worthy of an honorary award. From Messrs. Ballantyne and Son, there was a display of Tulips, Roses, and Auriculas; also Corydalis nobilis, with a basket of herbaceous and Alpine plants. From the garden of Dr. Neill, were Trichopilia tortilis and Dielytra spectabilis, &c.; also a collection of Alpines, among which were Rubus arcticus, Houstonia cœrulea, Gentiana verna, from Galway, Cochlearia acaulis, and Polemonium pulcherrimum; from the garden of S. Hay, Esq., greenhouse plants, including Pimelea Hendersoni, Erica Cavendishii, Daviesia latifolia; also forced Roses and Rhododendrons; from Professor Syme, exotics, including Heaths, Kennedya inophylla floribunda, and Daviesia latifolia floribunda; from Isaac Anderson, Esq., well-flowered specimens of Rhododendron formosum, Gastrolobium spinosum ovatum, Eriostemon scabrum, and Dielytra spectabilis; for these an honorary award was made. From C. K. Sivewright, Esq., dwarf specimens of Cinerarias, Adela Villiers, Cerito, Pauline, and Nymph, and nine seedlings; for two of which a certificate of merit was granted—the one a pale blue and the other white, both of fine form and substance, and dwarf habit. Mr. John Laing, gr. to the Earl of Rosslyn, sent seven seedling Cinerarias, one of which, named Countess of Rosslyn, was particularly deserving of notice. Mr. Baxter, gr. to Sir W. Gibson Craig, Bart., contributed a stand of border Auriculas, a seedling Gesnera—a hybrid between Douglasii and faucialis, and named by the committee, Baxteri, for which an honorary award was made. Mr. Shearer, gr. to the Marquis of Tweeddale, sent several promising seedling Cinerarias; and Mr. Anderson, Oxenford Castle, a dish of fine Strawberries. Keens' Seedling, and British Queen. From Mr. Forrester, Ratho, there were good stage Auriculas, and a fine plant of Trifolium uniflorum; and from Mr. Young, gr. to T. Oliver Esq., a trained specimen of Tropæolum tricolorum. Mr. Reid, Brucefield, Dunfermline, produced a seedling Ranunculus, named Countess of Harrington, which was recommended to be grown and exhibited again next season. Mr. Veitch, Parkhall, Linlithgow, exhibited six seedling Pansies and two seedling Cinerarias; and Mr. Cuthbertson and Mr. Thomson contributed stands of Wallflowers. Among the extra Vegetables sent for exhibition, may be particularly noticed some excellent Broccoli from Mr. Pender, the varieties of which were Melville's Late White, Mammoth, and Lauder's Late; from Mr. Carstairs, six stalks of very large and fine Rhubarb; from Mr. Douglas, gr. to Sir J. Lauder, a dish of Seakale; from Mr. Methven, gr. to J. Peter, Esq., a dish of Asparagus, and Early Potatoes from the open border; from Mr. Aitken, Dalkeith, superior Flanders Spinach and Victoria Rhubarb; and from Mr. Nicoll, a bunch of Early White Carrots. Mr. G. M. Butler exhibited a portable frame for striking Heaths and other hard-wooded greenhouse plants.

AMATEUR TULIP, *May* 29.—For stands of 9 blooms: 1st prize to Mr. Edwards, of Holloway, for Triumph Royal, Optimus, Cleopatra, Princess Royal, Cerise Blanche, Claudiana, Polyphemus, Triumph de Lisle, and Pilot; 2d, to Mr. Crook, of Brixton, for Roi de Siam, Claudiana, May's Ulysses, Royal George, Vivid, La Tendresse, Bijou des Amateurs, Triumph Royal, and Strong's King; 3d, to Mr. Sauders, of Staines, for Royal George, Strong's Queen, Cerise Belleforme, Polyphemus, Salvator Rosa, Marshal Soult, Rose Brilliant, Camuse de Craix, and General Bournouville; 4th, to Mr. Wallace, of Petersham, for Holmes's King, Rose Astonishing, Vivid, Polyphemus, Bijou des Amateurs, Catalani, Lucetta, Marshal Soult, and David; 5th, to Mr. Holmes, of Hoxton, for Franciscus Primus, Triumph Royal, Ponceau tres Blanc, Polyphemus, Holmes's King, Surpasse Cat., Aglaia, Vivid, and Laila Rookh. For stands of 3 Tricolors: 1st, to Mr. Crook, for Milo, Belladonna, and William IV.; 2d, to Mr. Holmes, for Aker's Lansoni, Miss Porter, and Carlo Dolce; 3d, to Mr. Wallace, for Carlo Dolce, Ariadne, and Ivanhoe. For the best 3 Roses: 1st, to Mr. Edwards, for Triumph Royal; 2d, to Mr. Bancks, for Catalani; 3d, to Mr. Wallace, for Aglaia. For the best 3 Byblomens: 1st, to Mr. Delaforce, for Jno. Delaforce, new; 2d, to Mr. Wallace, for Holmes's King; 3d, to Mr. Sanders, for Cleopatra. For the best 3 Bizarres: 1st, to the Rev. Mr. Jephson, for Vivid; 2d, to Mr. Holmes, for Vivid; 3d, to Mr. Lane, for Strong's King.

WARWICKSHIRE HORTICULTURAL.—The first floral exhibition of the season took place in the beautiful grounds of the Jephson Gardens, Leamington Spa, on the 28th May. Among the productions, those from the gardens of H. Colyer, Esq., of Dartford, stood pre-eminent, being alike remarkable for profuseness of flowers and healthy and luxuriant growth. The Ixoras, the Aphelexis, and Erica tricolor Wilsonii, were very fine specimens, and the general collection contained some capital plants. From Mr. Willmore's garden at Birmingham some good plants were produced; and A. Kenrick, Esq., of the same locality, had a few nice Orchids. Not less remarkable were the fancy Pelargoniums and other plants from the nursery of Mr. Ayres, of Blackheath, who produced (but not for competition) the same plants which obtained the first prizes at the metropolitan exhibitions. Mr. Bragg, of Slough, had some very fine Pelargoniums, with Tulips, Heartsease, &c. The fruit, more especially a Cayenne Pine, and the Peaches and Nectarines, from the gardens of C. N. Newdegate, Esq., M.P., was of first-rate quality. Mr. Colyer gained the first prize for greenhouse plants, and Mr. Bragg for Pelargoniums.

## Garden Memoranda.

HORTICULTURAL SOCIETY'S GARDEN, TURNHAM GREEN.—Perhaps at no period in the history of this garden has it looked better or possessed so many attractions as it does at the present moment. The red and white "May," the Horse-chestnuts, some of the Magnolias, Laburnums, Lilacs, and other ornamental flowering trees with which the arboretum is furnished, are now in considerable beauty; the Rhododendrons, a mass of flower, exhibiting the most charming variations of colour, and the lawn, though dry, being soft and green. The great Chinese Wistaria on the wall has been and is still loaded with large bunches of lovely flowers, but unfortunately they are now past their best. Not so those on standard trees, which are just in perfection; indeed the latter seem quite as much at home on the verdant lawn of an English garden as on the hill-sides in the provinces of Che Kiang or Kiangnan. It is scarcely possible to imagine anything more graceful or beautiful than a fine plant of this kind standing by itself, supported only by a stout stake. The walks in the arboretum are fresh gravelled, rolled, and in good order. The annuals, which have been temporarily put in the recently formed beds on the east side, are masses of blossom, and the different hues of the trees, which are now sufficiently thin to be seen to advantage, all add to the general effect, which at this season of the year is peculiarly striking. Mr. Fortune's Moutans, both in the open border and in pits, from which the sashes are removed in summer, have blossomed beautifully; and in one of these pits we remarked a large bush of the Californian Ceanothus papillosus, full of gay flowers, as was also a smaller plant of C. dentatus. If these should prove to be perfectly hardy, as it is expected they will, they will add what at present is a desideratum among ornamental hardy shrubs—a good blue colour. Solanum crispum was blooming profusely on the conservative wall. We remember seeing a plant of this in the shape of a standard in Mr. Rivers' Nursery at Sawbridgeworth, where it flowers finely in this state, and is very ornamental. In the large conservatory the huge Brugmansias were covered with long orange and yellow trumpets; and we observed that the white one, called Knightii, was likewise in bloom, as were also some of the Acacias and other things. The deliciously sweet scented Tea Roses, with which the sides of the paths in this house are furnished, were just beginning to expand their flowers and shed their fragrance. These are subjects which no conservatory can well dispense with.

By far the most attractive feature of the gardens, however, at present, is Mr. Hosea Waterer's magnificent EXHIBITION OF AMERICAN PLANTS, which is now open, from 9 A.M. to 6 P.M., free to Fellows of the Society, and to the public on payment of 1*s*. On entering this "garden of flowers," for so it emphatically is at the present moment, one is struck with the variety of surface which is presented, richly clothed with blossoms of the most brilliant colours, the whole being agreeably and suitably broken up into clumps, by gravel walks neatly margined with grass; here, winding along the level ground—there, ascending, by rustic steps, a gentle eminence, planted with gay Rhododendrons, and flame and yellow-coloured Azaleas—then into hollows, glowing with flowers, of the same charming plants, while here and there a huge specimen presents itself on a little mount of green turf, all producing an effect which no description on paper can possibly convey. Certainly, no collection of exotics, not even Orchids, could afford half so rich a display; and when we recollect that the whole of the beautiful varieties of Rhododendrons and Azaleas comprising this exhibition are perfectly hardy, that no expense in the shape of glass, pipes, or fuel, is incurred in their cultivation, they must be admitted to possess many claims upon all lovers of flowers. The skill of the hybridizer has wrought wonders in blending the rich colour of the Indian species with the hardy constitution of the Americans, and the results are the numberless varieties of tint in almost every shade from pure white to the richest crimson, and from pure lilac to the richest purple, all possessing a sufficient hardiness of constitution to withstand the winters of our climate. A more charming addition to a nobleman's flower garden than a collection of the best varieties of Rhododendrons could hardly be suggested, and in every place, however small, some appropriate situation might be found for their cultivation. Among the many magnificent sorts now in bloom in Mr. Waterer's exhibition, the following are particularly worthy of notice:—Rembrandt, rosy pink, flowers individually large and fine; Rubens, rosy pink, trusses *under canvas*, somewhat loose; hyacinthæflorum, a small lilac-blossomed kind, quite a bouquet of flowers; atrosanguineum, fine crimson; densiflorum, plum colour; Currieanum, large flowers, and a good trusser; Archimedes, rose; Titian, glowing crimson, flowers arranged in compact conical heads; cœlestinum, delicate lilac; catawbiense grandiflorum, lilac shaded with rose; and Everstianum, a good old sort. The best white is certainly Mont Blanc. Among Azaleas, pontica princeps—yellow slightly suffused with orange—was by far the most conspicuous. Of deep-coloured kinds A. coccinea major was as good as any. It need hardly be mentioned that the great fault of the finer Rhododendrons is their early habit of flowering. Their blossoms are out before the frost has left us; and unless some protection is afforded them, their beauty soon gets spoiled. We are, however, happy to see, that by means of judicious crossings this evil is fast being removed, or at least is greatly remedied.

In the Orchard department, the fruit trees are generally very healthy. Apples are likely to bear a plentiful crop. Pears on walls have been much thinned by the late frosts. Notwithstanding the cold nights in April, an abundant crop had set, and was going on favourably, till the 14th of May, when the thermometer fell about 5° below freezing. This was more injurious, in consequence of its occurring after a high temperature, which prevailed a few days previous; for the flow of sap was thereby greatly excited, and the sudden check caused much of the young fruit to turn yellow and drop. Some sorts have stood better than others, but none better than the Forelle, or Trout Pear; a sort, therefore, particularly valuable in such seasons, as we have lately experienced. Peaches and Nectarines on walls appear a fair crop, and the trees are now putting forth a healthy foliage. Strawberries are likely to be a good crop; and a plantation of the best new and old sorts will this year be in full bearing, so that any one can have an opportunity of judging fairly of their respective merits. The ground is everywhere clean, and the whole in excellent order.

We understand that plants of the new Sikkim Himalayan Rhododendron are nearly ready for distribution to Fellows.

## Miscellaneous.

*Food.* — The following is a copy of M. Masson's patent, for improvements in the preparation of certain vegetable alimentary substances, for the provisioning of ships and armies, and other purposes where the said substances are required to be preserved. Patent, dated November 2d, 1850.—"The object of this invention is the preservation of vegetables, fruits, and some kinds of seeds, which are gathered in a green, moist, or succulent condition, in contra-distinction to those which, like Wheat, &c., are first allowed to ripen and dry. The process is applicable to Cabbages, Cauliflowers, Spinach, Sorrel, Carrots, Turnips, Potatoes, Apples, Pears, Cucumbers, Melons, Beans and Peas, and many others, and consists generally in drying the articles by a gentle heat, and subjecting them to pressure, so as to consolidate them previous to their being packed in cases for the sake of rendering them more conveniently portable. Modifications will of course require to be made in the treatment of different vegetables, fruits, &c. Claims.—1. The combined process or processes of drying and forcibly compressing such substances for the purpose of preserving them. 2. The preparation of the stalks of Cabbages and similar vegetables by drying them, and grinding them to powder or flour. 3. The preparation of Peas and Beans by the combined processes of immersion in boiling water and subsequent desiccation." *Mechanics' Magazine.*

*Sale of Plants.*—A small collection, consisting of Orchids from Java, and Rhododendron Javanicum, was sold the other day by Mr. Stevens, at the following prices:—Phalænopsis grandiflora, from 2*l*. to 6*l*.; Dendrobium Henshalli, a "new species," from 1*l*. to 1*l*. 7*s*.; and Saccolabium Blumei majus, 1*l*. 5*s*. The Rhododendrons fetched from 11*s*. to 18*s*. per lot, of which there were in all 25, and of the Orchids 79.

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

LET neatness and order prevail in all the plant-houses, for however vigorous the growth of their inmates may

be, the effect produced is deficient, if the plants are not so arranged as that each may receive its proper share of room and light. Tying, stopping, and frequent turning, to keep every side of the various specimens in a healthy state, should be well attended to. Conservatory climbers will demand some attention, to prevent them from becoming entangled one with another. Let them be kept moderately thin, and not too closely tied in; for they never look so charming as when allowed to hang gracefully from the roof. Mandevilla, and some others, are very subject to green fly; and to keep these in check, use the syringe frequently in the afternoon, and endeavour to maintain a growing atmosphere, by sprinkling the dry surface of the borders every day after much sun heat.

### FORCING DEPARTMENT.

Admit plenty of air to Grapes which are colouring; maintaining a high temperature during fine clear weather. The litter used upon Vine borders may now be safely removed, except a little of the shortest and most decayed portion of it, which may be left as a mulching to protect any fibres brought to the surface by the warmth imparted to the soil during fermentation; and to prevent too sudden a check by the drying effects of strong sunshine upon the soil. Due attention should be paid to regulating the temperature to the various stages of the crops in Vineries. The healthy state of the foliage should always be kept in view; and to ensure this, admit air early; to dry off any excess of moisture before the rays of the sun come too powerfully upon the houses. Care should be taken to prevent, by frequent use of sulphur, the establishment of red spider or other insects. When no plants are grown beneath the Vines, the laterals may be allowed to extend themselves, so long as they do not by their shade interfere with the action of the sun on the principal leaves. Pay particular attention to the tying of the shoots, in the direction which will afford them the best opportunity of a healthy development. In the earliest house, as soon as the crop is gathered, the trees should be well washed with the engine, and syringed daily; the hot-water pipes, and any part of the house which is exposed to the action of the sun, should be washed over with lime and sulphur, to keep down red spider; and if the soil is dry, it should be well watered. These directions are given with a view to preserve the leaves, and to keep the plants in a healthy steady growing state as long as possible. By this means, the plants accumulate an extra quantity of elaborated sap, and avoid the injury arising from the alternate checks and excitements which are generally experienced during autumn in our variable climate, by plants which are allowed to go early to rest.

### FLOWER GARDEN AND SHRUBBERIES.

There are few plants which add so much to the beauty of the flower garden as the Humea elegans, of which some seed should now be sown, in order to secure a supply of fine strong plants for next season. The propagation of Pinks and many other useful plants for the flower garden should now be proceeded with, as they will strike freely at this season, and consequently no time should be lost in putting in a sufficient quantity of all the favourite kinds. Particular attention should be paid to the plants which were plunged in the reserve garden to fill up any gaps which may occur during the early part of the summer; and if any more can be spared from the late spring stock, they should be at once selected, as it is worth while to be at a little pains in keeping up a creditable display as late in the season as possible. Many of the fancy Pelargoniums are admirably adapted for planting in masses, and attention should be paid thus early to their propagation by those who possess only a few plants, that they may have as large a stock as possible for the next season. Amongst the most suitable varieties are Nosegay, Anais, Jehu superb, Hero of Surrey, Bouquet de Flore, &c. Shepherd's Victoria, and a few others which are very beautiful in the greenhouse, are too delicate for planting out of doors, except in very favourable situations, their flowers being of so slight a texture as to be quite disfigured by dashing rains.

### FLORIST'S FLOWERS.

Stretch a light awning over the Ranunculus bed; when shaded, water will not be so often required. If the flowers are intended for exhibition, they should have small glass caps or hand-glasses placed over them. These splendid flowers are not cultivated so much as they ought to be, considering the ease with which they may be grown. Carefully tend seedlings; those of the second year's growth will astonish, by the robustness of their habit; as they come into flower, mark those which show good properties, placing a small deal peg or tally against each, entering in a memorandum book their colour, qualities, &c. Should semi-double varieties exhibit any novel or striking points, these ought to be saved for the purpose of still further improvement, by crossing others with their pollen. DAHLIAS—Stake immediately, and water the young plants in dry weather. Sometimes snails make too free; it will be advisable by way of precaution, to put a ring of soot round each. Give Pinks liquid manure, reduce the buds according to the strength of the plants; keep them free from green fly; pinch out laterals; and as soon as convenient "pipe" the earliest shoots, and there will be time for another crop; some people layer Pinks, but they root so easily from cuttings, and are much neater plants, that we prefer the latter method. Do not forget Auriculas and Polyanthuses in pots, of course they are now in some cool and shaded spot for the summer; give them water as they require it, and see that the heads of seed are going on right. Propagate Pansies by the usual methods, &c. The stems of Carnations and Picotees will now elongate fast; carefully tie, but recollect that these ties must be occasionally looked to, and eased if they require it.

### HARDY FRUIT GARDEN.

It should be the aim of every cultivator of hardy fruits to induce a fruitful habit in all trees and bushes; and nothing conduces to this so much as summer stopping. The finger and thumb will do more at this season when the shoots are soft, than half-a-dozen knives in winter, and with far better results. To allow wood to be produced, which must not only be cut away again, but which, during its growth, is materially damaging the portion which is to remain, carries with it the appearance of very bad management to every reflecting mind. Thin the young shoots which have been thrown up by the Raspberry stools, leaving from three to six of the best, according to their strength; these will form fine strong canes, which may be trained as arches, or tied to stakes, at the next winter pruning. Any young shoots coming up at a distance from the old stools, may be left to form plants, which may be taken up in winter, to furnish new plantations, if such are likely to be required. Caterpillars on Gooseberry or Currant trees should be destroyed by hand-picking, or by dusting the trees with a little quick-lime. The cleanest way of proceeding is to dissolve some lime in water; and after allowing it to subside, to syringe the trees with the clear liquid.

### KITCHEN GARDEN.

All crops, which it is an object to bring to a high state of perfection in a short space of time, as early Peas, Cauliflowers, &c., will be considerably benefited by being watered with liquid manure; first loosening the surface of the soil with a fork, to allow the liquid to permeate the mass more thoroughly, and at the same time to produce a surface less favourable to evaporation. Another advantage arising from frequently stirring the soil, is in its allowing a freer action of sun and air, and at the same time the growth and increase of weeds will be prevented. Advantage should be taken of all dull and showery weather to prick out young seedlings of Celery, Cabbages, &c., into nursery beds, and to transplant the strongest plants of earlier sowings into their proper places. Basil, Savory, Tomatoes, and other things raised in hotbeds, should now be transplanted. Continue to sow Peas, and Broad and Kidney Beans, in succession, as soon as those of the last previous sowing appear above ground. Peas of former sowings must be furnished with stakes of the requisite height, as soon as the rows are perceptible; and when the plants have grown to within a few inches of the tops of the stakes, their points should be pinched off. Do not allow any crops which are cultivated for the sake of their roots or leaves to run into flower or seed, as Onions, Spinach, Parsley, Rhubarb, Lettuce, &c., but let the whole energy of every plant be directed, if possible, to the perfect development of that part for which it is cultivated, whether it be leaf or fruit; and any plants which have passed the stage in which they are useful, should be immediately removed. The early-grown crops of Parsley now require thinning; leaving them for the present about 4 inches asunder, and retaining the finest curled ones. As the plants increase in size, the intermediate ones may be cut away as they are required for use, or transplanted. Radishes and Letruces should now be sown on very rich moist ground; but, if the soil is of a hot and sandy nature, it will be better to cultivate these salads under the shade of a north wall during the summer.

State of the Weather near London, for the week ending June 5, 1851, as observed at the Horticultural Garden, Chiswick.

| May and June. | Moon's Age. | Barometer. | | Temperature. Of the Air. | | | Of the Earth. | | Wind. | Rain. |

| Satur. 14 | 74.0 | 50.2 | 62.1 | 9 | 0.21 | 1 | 2 | 4 | 1 | 4 | 7 | 5 | 1 |

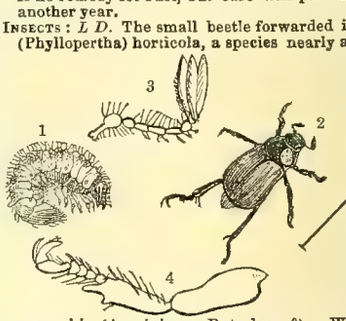
The highest temperature during the above period occurred on the 12th and 13th, 1842—therm. 90deg.; and the lowest on the 8th, 1838—therm. 35 deg.

## Notices to Correspondents.

"BIRDS,—HOW CAN I LEARN TO TAME THEM?" *Arabella C.* This is not so difficult as you imagine; nor is it fair to lay claim to any particular "art" in the matter,—successful though we have been in nearly every effort made. The "law of kindness" is the talisman by which these things are effected; a law which, if it were brought into more general practice amongst ourselves, would make society at large infinitely better than it is. The spell can be worked at any time by the magic rod of "affection." If this be properly handled, we must ALL fall before it. Such is the extent of power. Remember, however, to use that power for good *only;* and never dare attempt to commit any breach of confidence. Your birds will then be "tame," and will love you. *W. K.*

BLIGHT: *H W A.* Your Roses are attacked by Uredo rosæ, a parasitical fungus. You can do nothing more than cut off the branches and burn them.

CINERARIAS: *Iota.* Next week.*



DRYING PLANTS: *Botanicus.* All you can do is to press them between leaves of paper, and change the papers as often as they become damp. When species have a tendency to cast their leaves, that may be prevented by dipping the specimens in a weak solution of corrosive sublimate for half an hour. Their colours cannot be permanently preserved. For further information on this subject, see pp. 215 and 437 of our volume for last year.‡

FUNGUS: *B R W.* The wood is attacked by some of the dry rot fungi. Immediately remove all the decaying wood and burn it. At the same time provide apertures through which a strong current of air may be maintained beneath and above the floor. If you do not take care, you will find all your timbers rotten. Never store Potatoes, &c., on wooden floors in damp, unventilated places.

GOLD FISH: *Sub.* Your brown fish may be expected to change colour when they get older. The pond should be furnished with water plants, to screen them from the fierce rays of the sun in hot weather. You will find much information on their management in former volumes, more especially at pp. 36 and 213, 1844; and 3 and 36, 1845.

GRAPES: *Cymro* Your Grapes are attacked by rust. Rust is caused by any kind of injury to the skin of the Grape when young. Therefore the skin of your Grapes must have been injured when young—by what means we cannot tell. There is no remedy for rust, but care will prevent its appearance another year.

INSECTS: *L D.* The small beetle forwarded is the Melolontha (Phyllopertha) horticola, a species nearly allied to the cock-chaffer. The accompanying is a figure of it, and an account of its habits will be found at page 700 in the vol. for 1844. Fig. 1, larva; 2, perfect beetle; 3, nine-jointed antennæ; 4, a fore leg of the male. *W.—Norway Spruce.* The shoots of the Spruce Fir sent are infested with an aphis (A. pinivora Ratzeburg?). We know no more likely plan to get rid of these insects than to enclose the trees, if small enough, in a canvass cover, which must then be filled with tobacco smoke. We fear, however, there are other influences than aphides which prevent the growth of the trees. *W.—An Old Sub.* The minute beetles which you have found in the Apple blossoms are Cateretes pulicarius. Several of the species of this genus feed upon pollen. If you were to lay a few sheets of paper pasted together and covered with pitch beneath the trees, and then have them well shaken, great numbers of the beetles would fall, and be thus destroyed. The species is quite distinct in habits and structure from the little beetles which destroyed Mr. Westwood's Strawberries. *W.—W and Co.* The beetle found on the Vines is not the Curculio Nucum (which is found only in the Nuts). It is the common Otiorhynchus sulcatus, which may be caught at night by laying a sheet under the trees and then shaking them. *W.*

IVY: *E F L.* Ivy will suit your purpose best. It will not harm the walls. ‡

LIGHTNING-CONDUCTORS: *Country Squire.* The lightning-conductor should be a stout rod of iron or copper, pointed at the end; copper does not rust, and is on that account often preferred to iron. So long as the rod is not connected with the house by a conducting substance, it seems to matter little what is used to keep the rod in its place. The rod should terminate below the ground in two or three branches, and if these can be placed in a natural spring of water, so much the better. See the "Penny Cyclopædia," article "Thunder-rods."

LUSUS: *J C L.* It is common in England, where the plant that produces such sports is usually called Cytisus Adami and purple Laburnum; sometimes the flowers are those of C. purpureus, sometimes of Laburnum, and sometimes between the two. Its true history is uncertain. *Au reste,* it is sad work; and will effectually drive off English capitalists.

NAMES OF PLANTS: *P B.* 1, D. calceolaria; 2, D. cupreum; 3 is much shrivelled, but looks like Oncidium pelicanum—a variety of O. reflexum; 4, Phytolacca octandra.—*Barbara.* Your plant is Fabiana imbricata, a half-hardy shrub, requiring nearly the same treatment as a Heath.‡—*E S.* Hippeastrum Johnsoni.—*W.* It has not the most remote resemblance to Tussac Grass.—*Geo. Pickering.* Your plant is some Hoarea, but we cannot waste time in determining what species, unless you send sufficient specimens.—A few inquiries stand over for further consideration.

MUSHROOMS: *J George.* Your proliferous Mushroom is a curious thing; but such cases are not very rare in Mushroom-houses.

PEACH-HOUSE: *J L H.* Of the two aspects, the south-west by west is the best.‡

RED SPIDER: *E W W.* The vapour of sulphur is, we believe, the only effectual destroyer of this pest.‡

TOBACCO: *J H I.* We have seen much better English Tobacco than that you have sent. Nevertheless we cannot for a moment admit that it can be cultivated profitably in Great Britain, unless with the help of a tax on the public, disguised under the name of a protecting duty. You will find upon inquiry that it is in the north of Europe a pauperising worthless crop. Surely it is obvious that a plant grown in an unfavourable climate, with costly appliances, high rents, much manure, &c., and expensive labour, can never enter into mercantile competition with the same plant with a most favourable climate, low rents, cheap appliances, no manure, and labour of nominal value. We should be sorry to see a great branch of revenue damaged by granting permission to British farmers, to ruin themselves by hopeless attempts to grow a bad article.

VINERY: *G B.* Of the two aspects, the south-west is the best.‡

### SEEDLING FLOWERS.

CALCEOLARIAS: *Amateur.* Of your flowers 1 is the best, both in colour and shape.*—*Reader.* Much too small for "show flowers."

GLOXINIAS: *Sub.* 1, large white, with a velvet purple throat; 2, in the way of Cartoni; 3, violet. 1 is the best, 2 is too small, and 3 does not expand sufficiently.*

PELARGONIUMS: *W C.* A good scarlet, but that is all we can say about it, for it had fallen to pieces before it reached us.*—*Beta.* Your "fancy" is pretty, and well worth cultivating.*—*J M A.* A confused mass of detached petals when received. 2 and 4 have good colours.*

VERBENAS: *W D.* Your pink and white Verbenas were somewhat shrivelled; but they do not appear to be near so good as some of the French kinds.*

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS,

AS THE

ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by Dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

NEW TURNIP MANURE, 50*s.* a Ton.—Mr. POTTER can strongly recommend the above as a cheap and efficient Manure, and capable of raising heavy crops. Delivered free on rail. The Bags to be returned or paid for.

POTTER'S GUANO, 7*l.* per ton; SUPERPHOSPHATE OF LIME, 6*l.* per ton; GYPSUM, 25*s.* per ton, including bags and delivery on rail.—28, Clapham-road-place, London.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.

Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

MR. J. C. NESBIT, F.C.S., F.G.S., Consulting and Analytical Chemist, Laboratories, 38, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 10*s.* per ton; and for 5 tons or more, 9*l.* 5*s.* per on, in dock. Sulphate of Ammonia, &c.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9*l.* 10*s.* per ton, or 9*l.* 5*s.* in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

HOSE FOR LIQUID MANURE, Fire-engine and agricultural purposes, made of canvass, lined and coated with gutta purcha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure, it is extensively used at the Government public works; also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

HOSE! HOSE!! HOSE!!! Improved Canvas-coated and Lined Hose, for Liquid Manure, Fire Engines, Garden and Farm purposes.—This Hose is greatly improved, the rigidity of seam avoided, the flexibility increased, the waterpoof qualities extended, the price more reasonable, and the pliancy that of a lady's glove. Much research and trial by the Manufacturers has enabled them to arrive at what they consider a perfect Hose.—Apply to Messrs. MITCHELL and Co., 98, High Holborn, London; International Depot for Patented and other useful Inventions.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.

PATENT VULCANISED INDIA RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and) Manufacturer, Goswell-road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use; are particularly suitable for Fire Engines, and are found exceedingly useful in dwelling houses for conveying Hot or Cold Water to Baths, &c.

Testimonials and prices may be had on application to the Manufactory.

N.B. Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

All Orders or Letters addressed to J. L. HANCOCK, Goswell-mews, Goswell-road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boats, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abethaw Lime, and Roman Cement. Fine Black, 25*l.* per ton, and Rich Purple-brown, 20*l.* per ton.—Offices of the Company, 1, New Broad-street, London.—JOHN A. WEST, Secretary.

HAYMAKING ECONOMISED.

WEDLAKE AND THOMPSON, Inventors, Improvers, and Manufacturers of the double-cylinder HAY MACHINE (which obtained the prize of the Royal Agricultural Society), beg to call the attention of agriculturists to the above valuable Implement; the motion of which, by a very simple contrivance, is reversed, and turns the hay after being shaken from the swathe, thereby effecting a considerable saving in the expence of manual labour. Horse, Hay, and Corn Rakes, Oat Bruisers, and every description of Agricultural Implements, upon the most improved principle, and at a great reduction in price.—Address, Union Foundry, Hornchurch, Essex.

IRON GATES, HURDLES, WIRE WORK, &c.

THOMAS PERRY AND SONS, 252, OXFORD-STREET (NEAR HYDE-PARK), And Highfield Iron-works, Bilston,

MANUFACTURE all kinds of Park Entrance, Carriage and Field Gates, Wickets, Wrought and Cast Iron Gate Pillars, Plain and Ornamental Fencing, Palisading, and Balconies. Ox, Cattle, Sheep, and other Hurdles.

Tree Guards, Garden Seats, Garden Rollers, Wheelbarrows, Stable Fittings, &c.—Iron Work of every description.

Wire Work in great variety, comprising Gothic and other Fencing, Flower Stands, Trainers, Arches, Pheasantries, &c.

The works being situated in the centre of the Staffordshire Iron district, THOMAS PERRY AND SONS are enabled to execute promptly orders to any extent with the greatest facility, of the best quality, and on the most moderate terms.

Manufacturers of every kind of Solid Iron and Tube BEDSTEADS, with all the recent improvements.

**The Agricultural Gazette.**

*SATURDAY, JUNE 7, 1851.*

MEETINGS FOR THE TWO FOLLOWING WEEKS.

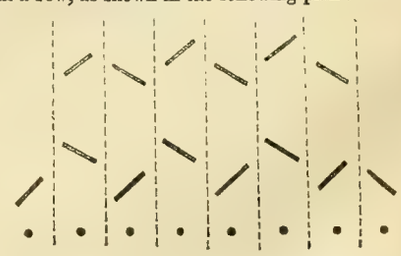
WEDNESDAY, June 11—Agricultural Society of England.
THURSDAY, — 12—Agricultural Imp. Soc. of Ireland.
WEDNESDAY, — 18—Agricultural Society of England.
THURSDAY, — 19—Agricultural Imp. Soc. of Ireland.

THERE is a particular stage of growth at which the strongest of the strong, and even the fairest of the fair part of creation are said with truth to be "at the *awkward* age." The simplicity and weakness of childhood, and the vigour of maturity meeting upon neutral ground, as it were, present that singularly chaotic struggle in the frame, which, confusing for a while the appropriate characteristics of either state, produces that anti-symmetrical condition and effect upon the eye of the beholder that has been not inaptly described as "all arms and legs."

The present condition of agricultural economics, and of the agricultural literature therewith connected, is not a little suggestive of this temporary state of adolescence, ungraceful it may be to the eye of the critic, but replete with signs of excellent promise of development. It must always be the misfortune of a class, not much given to literary pursuit, even upon topics the most closely allied to its own interests, and not affording, therefore, much encouragement even to its most able men to venture into print—to realise in a great measure the foregone conclusions of its own prejudice, and reading but little, to find but little worth reading. That this *has been* precisely the condition of agriculture in our own remembrance there is scarcely one who will deny: that agriculture is peculiar in this respect is probably not true: that the art is rapidly growing out of this condition, though not yet clear of it, has received some striking evidences from the recent contributions of the press. We have begun to think, to put our thoughts into language, and our language into speeches, pamphlets, reviews, and books: but what we have yet scarcely begun to do is to put sufficient faith in each others' intelligence or attainment, to save the necessity of a fresh reiteration by each writer of a string of undisputed premisses before each conclusion that he arrives at. We have learnt to express, but not to *sup*press.

The careful and able work of Mr. DEAN* may afford to submit to this preliminary qualification of the praise with which we regard it. "There is much in your book that is new," once remarked a spiteful reviewer, "and much that is good; but that which is new is not good, and that which is good is not new." We have seldom read a work which suggests a happier converse of this cruel antithesis. We would say of it, *è converso*, that if the author had only ventured on a bolder ellipse, in his work, of that which is not new, its excellence, as a work, would have been more striking, and its utility not impaired. There are some truths that instead of being strengthened, suffer some injustice from renewed affirmation. The obvious duties of landowners to their tenants, and of tenants to their land, and their labourers; the recognition of geology as having something to say in the choice of soil in a farm, or an estate, the advantage of drainage and of suitable tenures, and security for the tenant's capital, are certainly facts, and rather important facts too; but like those of the multiplication-table, or the preliminary page of axioms in Euclid, they have become potential, and may be pretty well assumed without elaborate proof, by a writer who has so much to say, well worth a fresher attention, as the author of "The Land Steward."

* "The Land Steward." By G. A. DEAN, Agricultural Architect and Engineer. Author of "Essays on Farm Buildings, Labourers' Cottages," &c.



Mr. DEAN'S work is comprehensive in its character and (subject only to the above stricture), is bold, truthful, and original in its treatment. It consists of 12 chapters, all upon useful and practical subjects, to every class connected with the land-tenure, fixtures, and dilapidations, valuation, drainage, roads, farm buildings, timber, with some excellent remarks on climate. The pages on dilapidations have the virtue of an explicit tone rarely attempted upon these *vexatæ questiones* of tenant-law, and are followed by a tabular statement of the leading law cases on fixtures, accurately compiled, and of great importance. There is a passage in this chapter to which, however, we must take exception. Mr. DEAN claims amongst other securities required "a power to *compensate the tenant for improvements* effected on estates, where the landlord has *not power to grant leases*, or where his interest is so limited that he should not be required to grant them. In this case, power should be given to the tenant to effect such improvements, either by buildings or otherwise; and should he at any time quit his holding, he should have *a claim on the incoming tenant, or against the estate.*"

This reminds one a little of the advice of the French Princess to the starving people, when they could not get bread to content themselves *with pastry*. The power to charge an estate with compensation to a tenant for improvements, or to devolve such a charge upon the next owner, is one of the highest order, which *no* owner of less than the fee simple can exercise, whilst the power to grant leases, even of 21 years, is commonly possessed even by life owners. The *alternative* suggested by Mr. DEAN broaches unconsciously the grand besetting difficulty of the compensation clause, a far greater than exists in the general extension of the power of leasing, and the conferring of which on life owners, viz., a general power to charge future interest, would amount to a virtual abrogation of settlements, and of the law of entail altogether. As to a running charge upon the land, or the next occupant of the farm by an outgoing tenant (between whom and a new comer no possible contract of any sort can be raised in law), the proposal, easy-sounding as it is, treads upon a hot-bed of difficulties, far worse and more impracticable than it seeks to cure.

Writers upon agriculture have scarcely as yet a conception of the enormous undercurrent of conflict between our *whole system* of real property-law, with the present demands of our advancing agriculture. Current events are making them feel their way to the subject. They will find presently what a life-and-death struggle it is, and that the palliatives they suggest may damp the flame of strife, like fresh fuel, for an instant, but only to make it burn the fiercer, and that very shortly. We shall renew our notice of Mr. DEAN'S valuable accession to the agricultural library.

## REPORT ON THE AGRICUTURAL SECTION OF THE GREAT EXHIBITION.

No. V.—We come now to the HORSE-HOES. Every farmer has heard of Garrett's Patent Horse-hoe for work on the flat, whether corn or roots, provided the plants be in rows not less than seven inches apart; but many have not yet seen it, and many more have not begun to use it. This is universally acknowledged to be one of the most effective implements ever invented; and its principal advantage is the celerity with which it will perform the work, as compared with hand-hoeing, so that when the weather just suits, the farmer may accomplish the operation, which otherwise must have been, in a great measure, imperfectly done, in consequence of rains, &c., interfering with the slow progress of his men; and the cost with this implement amounts to no more than 6*d.* per acre, as from 10 to 15 acres per day may be hoed with one horse, a man, and a boy. The hoes are attached to levers like those of a drill, each having an independent vertical motion, and being set to any required depth by regulating keys. There is a swing action for guiding the hoes, according to the swerving of the drill-rows. All the levers are raised at once by eccentrics and chains; and any one or more can be held up out of work by means of springs. The cutting-hoes are straight blades set diagonally to their work, and arranged two in a row, as shown in the following plan:—

A bar, carrying harrow tines, is suspended behind the hoes, which is of service for shaking out the weeds from the cut soil. A box is attached for sowing Clover, &c.; the spouts are round, but flat and expanding at the bottom, so as to spread the seed. The axle-tree of

this machine is made moveable at both ends, to suit the varied intervals between the rows of cropping; so that it may be also worked on ridges as well as the flat.

W. Smith, of Kettering, Northamptonshire, has invented an admirable implement of the same kind, very simple in its construction, and calculated to be of service to those who hesitate to purchase the more expensive one of Messrs. Garrett. The hoes are fastened upon two cross-bars—one before the other—indented or toothed so as to hold the hoes firmly in a certain place and position. These bars can be easily lifted by a couple of handles. A seed-box is fixed upon the wheels in front of the machine.

Busby's horse-hoe, for use on the ridge, is an excellent implement, from the form of the cutters; the front or middle hoe being in shape something like a letter D, which is better calculated to cut weeds and roots than the triangular share. A hoe invented by D. Harkes, of Mere, near Knutsford, seemed to us to possess considerable merit. The beam has a wheel at each end, the fore one being steered by the hook holding the whippletree. The side knives resemble small single winged shares facing each other, and preceded by coulters; they are set upon two bars held parallel to the beam by two levers, attached to the beam by joints at their middle points. As these levers are set more or less obliquely to the beam, the hoes are more in or out; and yet while thus fitting a narrower or wider row, the hoes never approach nearer to each other, so as to impede their action. A lever on the right hand plough-handle alters the width by a connecting rod, without the plough being stopped for the purpose. A parallel expanding horse-hoe, by J. Barker, of Dunnington, near York, has also the same kind of action, but regulated by screw and crank between the plough handles; this is, perhaps, a neater arrangement. E. Hill, of Brierly Hill, Staffordshire, exhibits his prize horse-hoe, which has a remarkably good method of expansion and contraction, the width being altered at pleasure, when in motion, by a scissor-like action given to the handles. E. H. Bentall, of Heybridge, Essex, shows a patent mangle or ridge hoe, which, like his broad-share and subsoiler, has a narrow plough frame carrying a chisel point in front, and a forked share (of shape something like a mackerel's tail fin) at its heel, the two blades being turned up a little at their tips. A short cross-beam carries common bent cutting knives, which can be shifted along it.

There are likewise other implements of the horse-hoe species, intended either for cutting up weeds, stirring, agitating, and loosening the soil about the roots of the young growing crop, harrowing and pulverising the surface, or earthing up the plants in ridges. Ransomes exhibited an implement capable of performing all these different operations of ridge culture. It was invented by John Clarke, of Long Sutton, Lincolnshire, and is called the universal plough. By an easy transition of shape, effected in a simple manner, it becomes: 1st, a double tom, or ridge plough, for opening or closing the soil in ridge work, for setting out lands for common ploughing, or opening surface drains; 2d, a moulding plough, to be used in moulding up root crops, Peas, or Beans; 3d, a horse hoe, or cleaning plough, with curved coulters for cleaning the sides of ridges, or with flat hoes for broad work; 4th, a skeleton, or broad-share plough, to which shares of different breadths and with rising prongs may be attached, for the purpose of clearing land from weeds and rubbish. And the price is low, considering its general utility.

The double ridge-plough is used in seed-time for opening the furrows; and we observe that A. Low, of Dundee, has made an improvement for this purpose in his double water-furrow roller plough. The double breast, which can be expanded by a screw, is followed by a small roller of peculiar form, resembling, in fact, a double longitudinal section of the Crystal Palace,—the circular protuberance in the middle pressing the furrow into a neat and even trough. From North Britain, we of course expect to see various appliances for perfecting ridge husbandry; and among the less important improvements is one from G. Ponton, of Grongfoot, by Linlithgow,—being a double-winged or ridging plough furnished with a "marker,"—that is, a sort of small anchor attached by a hinge to the beam, the fluke drawing a line on the unploughed land at any requisite width, to guide the ploughman in his next furrow.

Of hand-hoes and spuds there are no doubt all varieties, to be found on searching in the proper departments; among the implements in Class 9 we noticed only two that seemed very remarkable. One is a double hoe, invented by Dr. Spurgin. The blade, which is sharp all round, is in figure somewhat like two musical brackets set together,  only rather broader in proportion to the length, and from the centre rise up two long shafts or handles, making a wide angle with each other, like the two sides of a letter V, and slanting in the direction of the hoe's length. We suppose it is to be worked by two persons at once; but the cutting blade is not large enough to do the work of more than one. Perhaps it may be designed for some peculiar operation in gardening, as certainly no farmer would venture to go into the field with a tool like this for his men. The other contrivance that we saw is called "A Lady's Garden Implement, combining hoe, spud, and rake all in one." It consists of an iron hand-rake, having a blade at each end of the row of teeth, one pointing nearly in the direction of the handle, the other the opposite way. It is designed by B. Ebbs, of 9, Lower-road, Islington; and our farmers' wives accompanying their lords into the agricultural department will find in this tool what can save them a multiplicity of instruments, and enable them to extract weeds between closely planted flowers without the necessity of treading on the beds, or stooping to pull up weeds with their hand. *I. A. C.*

## THE TULLIAN SYSTEM.

IF the principles upon which the Tullian system is founded are true—if the opinions of Liebig and other professors of agricultural chemistry are just—if the practical results of our working our naked fallows are to be relied on—crop after crop may be produced, improving with each successive production, by the soil being kept so continually open and broken up, as to admit the constant inflow of the atmosphere, of rains, and of dews, and all other natural operating causes of fertility, so as to supersede the necessity for the introduction of all other organic elements, as manures, and—with the exception of those of which there may be a deficiency in the natural composition of the soil—of all inorganic matters. I do not, however, infer from these premises that greater fertility will not be produced by such additions.

As the recovery of fertility in our exhausted lands in Ireland has always been left to the slow operations of unassisted Nature, in unworked fallows, or, in Irish parlance, "waste," I have endeavoured, since the failure of the Potato crop, and consequently of the intermission of an only worked fallow, to impress upon the farmers the probable advantage of availing themselves of the fertilising effects of natural causes, aided by mechanical operations, while they produce disposable crops; and this by adopting grain as a fallow crop on their exhausted lands, thus rendering those lands, which they leave for years in an unprofitable state, and indeed in a state of loss to them; for the rent of these lands must be paid from the produce of the cultivable grounds, productive of an ample sufficiency of home grown food for their consumption, enabling to keep up that export of grain, which, while they fed on Potatoes was—and indeed, is—our main source of income. Indeed, I saw not then, nor do I yet find, rife as the time is in inventions, any other way of meeting effectually the exigencies of our case. Our poverty must prevent us availing ourselves of the usual fallow crops; we could only grow Turnips, &c., for the market; we could not feed, nor consequently could we obtain manure for any great extension of their tillage. We must have grain fallow crops, or unworked fallows, a naked fallow is all unthought for.

Nearly one half our land is in this unprofitable natural state of recovery from exhaustion, left after the last grain crop to its natural products—a many years' accumulation of weeds; this herbage is picked up by some miserable pinched cattle; at first, perhaps, it will require half a dozen acres to give even this sort of support to a thing called a cow, worth from two to four pounds. Sir John Young, in his report on the Balieborough Union, county of Cavan, says that in 1847, in the union there were

| | |
|---|---|
| Under crops ... ... ... ... ... ... | 33,014 acres. |
| Bog and waste ... ... ... ... ... | 8,592 " |
| Uncropped and not meadow ... ... ... | 46,086 " |
| | 87,692 |

Thus more than one-half of the union (46,086 acres) is not under crop; and Sir John asks "Now what becomes of all this land and what does it produce?" and he replies "It passes under the denomination of pasture, but it is in reality fields utterly uncared for; and though subject to every burthen of rent, tithes, county cess, and poor-rate, producing nothing but noxious weeds, Sedge or Coarse Grass. These fields, exhausted by several crops of grain, taken in succession until the land would yield no more, have been cast out to rest, as it is called, or recruit their powers through time and the influence of the elements, without any help from man." The Commissioners of Poor-law Enquiry, Ireland, Appendix F., state, "In Cavan agriculture is in the most wretched state imaginable. The rotation is—1st, Potatoes from lea; 2d, Potatoes, repeated with some manure; 3d, Wheat, Flax, Barley, or Oats; 4th, Oats; 5th, Oats; 6th, Oats; and so on, as long as they can. Not much Wheat is grown. If they have a field in lea, likely to yield a better crop, on which to exercise this scourging system, they leave the land, which they have deprived of its productive powers, to come round by time for a repetition of their former operations." And this is the general prevailing system of Ireland, with some variations, such as omitting the manure altogether on the richer lands, burning the poorer lands; and, since the failure of the Potato crop, laying what little manure they have on the Oat stubble, to obtain yet another crop of Oats.

I believe, under the faith of Tullian principles, that this land might be turned to better account, and afford the employment so much required in the country; that the first year's crop would pay all expenses, including rent and taxes, and even leave some small profit, while in succeeding years the returns ought to be so much larger, with reduction in labour, that indeed so large a surplus over the cost of production would be obtained, as to enable the cultivator to supply himself with stock to consume the green crops which he might then profitably cultivate, and for the small seeds, for which the ground would then be so well prepared.

But preaching was vain; and though I had charmed ever so wisely, the voice of the charmer was not listened to. I now hope to speak more forcibly, by putting into wider practice those suggestions which have possibly hitherto been disregarded, as supposed only to exist in theory, or little esteemed, as supported only by limited experiments and the deductions of reason; for as my friend, if he will permit to me this familiarity, the Rev. Mr. Wilkins says, there are men who value experience by its width, not its closeness of observation.

Another objection which in Ireland is of great weight, and indeed where, from the cheapness of labour, it has least excuse for existing, lay in the apprehension of the heavy expense of hand labour, although hand labour is not necessarily involved in these operations; but this objection I trust I shall remove by the subjoined statements of the expense hitherto incurred in the hand tillage of 8 acres of land, which I believe will be found not to reach the expence that would have been incurred to support the labourers and their families, for the time they were employed, in the poor-house.

These 3 acres are part of two small farms, that by the poverty of their late occupiers, and the course of cropping, which their poverty and the custom of the country entailed upon them, have been reduced nearly as low as land could well be. For more than six years, except in one instance, no manure has been laid on these farms; the hay, the straw, and even the house manure, having been sold off; ejectment and a sponge having cleared them also of their tenants, and two or three years' arrear of rent.

Field of 3½ acres, very long in tillage, in successive crops of Oats, no manure for several years, got a ploughing in 1848-9 with the intention of sowing Oats, but occupier not able to purchase seed, and therefore abandoned to its natural products, loaded with Couch Grass and other weeds. Turned by spade in January, 1851, 8 or 9 inches deep, in flat ridges, 11 feet wide, with 2 feet trenches; harrowed, and a good deal of Couch Grass gathered off; Oats sown by hand, in rows about 23 inches apart, 6 rows in a ridge, and covered from the trenches, the trenches being dug so deep as to raise two or 3 inches of subsoil; the seed sown, about 6 stones to the acre. This field, under ordinary treatment, not supposed capable of yielding a crop, certainly not more than 60 or 70 stones to the acre. Dug between 7th January and 1st February, 1851; sown between 8th and 14th April

| | | | |

| Allow for sowing (done by myself) ... ... | 0 | 5 | 3 |
| Or, 1*l.* 10*s.* an acre. | £3 | 5 | 6 |

Field of five acres much exhausted upland meadow, not having been manured from time immemorial, ploughed, and two crops of Oats taken in succession, left to Nature one year, covered with coarse weeds and some Couch Grass. Turned with spade in February and March, 1851, 8 or 9 inches deep, in flat, ridges 9 feet wide, with 2 feet trenches; Oats sown by hand, in rows about 23 inches apart, 5 rows in a ridge, and covered from the trenches; the trenches dug deep, so as to raise 2 or 3 inches of the subsoil, the seed about 7½ stones to the acre. This field, under ordinary treatment, not considered able to give a remunerative crop, supposed equal to about 70 stones to the acre. Dug between 3d February and 29th March, 1851; sown between 8th March and 4th April.

| Sowing ... ... ... ... ... ... | 0 | 7 | 6 |
| Or, nearly 1*l.* 9*s.* an acre. | £7 | 3 | 10 |

A field of 7¼ acres, well manured six years ago, a Potato crop taken, and two successive crops of Oats; they would have taken a third, but could not, and left "waste;" very weedy, but considered in better heart, and well capable of yielding a crop, much more so than either of the others; supposed equal to give 100 or 110 stones to the acre; was ploughed in February, and sown broadcast, under the harrow, and trenched from deep furrows in the middle of April. It is proposed to compare the produce of this field with those of the two hand worked and sowed in wide rows. It has evidently the advantage of them in condition, and it will be seen whether the after labour of the latter will compensate for their inferiority. *J. M. Goodiff, Granard, May* 23.

## CULTURE OF SAINFOIN.

IN a former paper, we introduced this plant as deserving of more extended culture upon lands suitable for its growth. We then promised at a future time to enter more minutely into its details, and we shall now endeavour to fulfil that promise, by describing as clearly as may be compatible with the shortness of our space, the best methods of cultivation. It is well known that Sainfoin delights in all dry, calcareous soils; and light sand, and gravelly loams, having a calcareous subsoil, are equally favourable to it. To ensure a fine crop, and one that will continue good for a term of years, it is necessary that the land should be clean and in good condition; for to the neglect of these principles of good husbandry may be attributed the very generally received opinion of the south-country farmers, that the first year's crop of Sainfoin is much inferior to the after ones; while upon highly cultivated soils the first year's crop is generally found to be the heaviest.

However, the cultivation of Sainfoin may be separated into two divisions, which, for convenience sake, we will describe—the first as the permanent, and the second as the alternate system.

The first is practised in the southern counties previously mentioned by us as the head quarters of Sainfoin

farming, and where the Sainfoin leas remain several years, and are of great importance to the large flock-masters. There the practice is to sow about 5 bushels of rough seed per acre, with Barley or Oats, put in after Turnips, and to add 4 or 5 of lbs. Hop Clover to fill up the deficiency of the first year's growth. The more spirited farmers, occasionally have a crop of Swedes, followed by Rape, the latter being fed off early; the land is put in with Wheat, and the same quantity of Sainfoin is drilled across the rows of corn in the spring; and as the land is intened to remain in Sainfoin for a term of years, this plan is a very good one, for much additional fertility is given by feeding off two successive green crops with sheep, and the tillage the land receives gives a great check to the growth of weeds. One cause of Sainfoin leas so soon becoming a mass of Couch and Rye Grass, is the practice of feeding sheep with hay, that has stood too long before being cut; all good managers, therefore, are careful to use only such hay (upon land intended for Sainfoin) as is made from Grass cut before the seed is formed.

Sainfoin is usually fed or cut for hay the first year; the time for cutting begins as soon as the beautiful blossoms of variegated crimson make their appearance. The manner of making into hay is not very different from that of Clover, but care must be taken to move the swathes as little as possible, while the sun bears much power, or a great deal of the leaf, the best part, will be lost.

In the alternate system, lately introduced upon the light land farms of Suffolk and Norfolk, Sainfoin takes the place of the ordinary Clover or mixed leas, and its becoming more extensively cultivated may be attributed both to its being so highly esteemed as food for sheep and other stock, as well as to its being a most excellent preparation for Wheat, when ploughed up after the first or second year. About 4 bushels of seed are sown with Barley, grown after Turnips, or, what is better, the seed is drilled with a common coulter corn drill, across the rows of a crop of Wheat or Barley, that has been put in after a root crop, fed off. The plan we have practised with the most success is by drilling the seed upon young Wheat, on land in good condition, and that has been thoroughly cleaned. The seed vegetates with greater certainty when the land is moderately firm, with a finely pulverised surface. Seed of Burnet, Rye-Grass, and of a variety of brown Grass (?), is too often grown with Sainfoin, and it is very difficult to separate from the seed while it remains in the husk. When clean seed cannot otherwise be obtained, "Drewe's" or "Milled" seed may be sown, from 50 to 60 lbs. being used per acre. The husk is removed from the seed by subjecting it repeatedly to the rubbing action of a pair of millstones. The seed will vegetate sooner, but is hardly so certain of producing a plant as rough seed. Sainfoin seed can seldom be bought for less than 30*s.*, and it sometimes exceeds 40*s.* per quarter—the produce of clean drawn seed from a quarter of good seed is a trifle above 1 cwt. From this it will be seen that the expense of sowing down an acre varies from 15*s.* to 25*s.*, which, upon poor land, is much too great an outlay to be compensated for by the produce of a single year; still, when it remains for a succession of years, upon the poor light soils of this country, I believe there is no plant, whether in its produce of nutritious sheep food, of hay or of seed, or in its amelioration of the land by rest, is cultivated so cheaply, or is of so much advantage to the farmer.

An important feature in its culture is the almost marvellous effect which sometimes results from the application of 3 or 4 cwt. of gypsum per acre. Instances occur where the increased value of produce from the first crop exceeds many times the value of the manure, and, at the same time, in other cases, the benefit by the use of gypsum is quite imperceptible. Our advice is always to try whether the gypsum is productive of advantage, before applying it extensively. *H. R.*

## Home Correspondence.

*Mr. Murphy's Archimedian Agricultural Machine.*—Relying upon your sense of justice and candour, I expect and solicit that you will give insertion to this communication, in order to reply to an article which appeared in your Journal, as quoted in the *Express*, which purported to convey an impartial review of the model of my "Archimedian Agricultural Machine," now displayed at the Great Exhibition of 1851, and for which I have obtained a provisional registration under the late Act. If such criticism arose from a candid and impartial spirit, I should have no objection to its publication; but when it evidently commits mistakes that a fourth-form schoolboy would repudiate, I consider it is due both to myself and the public to set the matter before them fairly. For instance, in describing previously Mr. George Thompson's Patent Machine, the article alluded to proceeds to say, "it is an immense strong timber rectangular frame, about 11 feet by 8, horizontally resting on an axle, with two carriage wheels, each of nearly 7 feet diameter. The aspect of this engine is certainly calculated to alarm a quiet farmer; and in another part of the implement court is a model (the Archimedian) which, had it been constructed the full size of the machine, would be still more terrific." Now, the Archimedian machine (when constructed of its maximum size, namely, the cylinder 4 feet 6 inches in length by 4 feet in diameter) is certainly not half the magnitude of the other, as the writer could have been informed by any schoolboy, if he were himself unable to estimate the scale at which the model was formed, and therefore the term "still more terrific" was totally unjust and inapplicable. The writer, after entering into a further description of the Archimedian and its workings, goes on to state, "we should expect it on trial to be immediately clogged full of dirt," although he previously described the cylinders as armed of "different forms, being for varying soils and purposes;" and further stated, "it may be set by screws in its frame to a greater and less depth." And truly so did he state the fact, because it can be made, if necessary, not to enter the soil more than one inch. And yet how this writer and reviewer could not perceive that, from the different arming of the various cylinders, and the use of the regulating screws, this very egregious objection of his could be obviated and prevented, it is difficult to conceive. But the reviewer has cautiously avoided offering the slightest censure against the principle involved in the invention of this machine, and by which alone its utility can be truly tested, because he found it probably unassailable, and yet this machine is equally applicable to the performing, in the one operation, the work of four ploughs, at its full size; as well as in its diminished form it is capable of being used by mere manual exertion for horticultural purposes, like an ordinary garden wheelbarrow. The writer and reviewer may no doubt term this an "unwarrantable assertion," but it will be for the public to judge, and more especially for the scientific portion of it to decide whether his own objections are anything more, and whether any impartial and just object can be in view by a writer who endeavours to disparage an invention marked for its novelty, utility, and efficiency. *D. J. Murphy, Chamber of Commerce, Cork.*

*Spade Husbandry.*—I am glad to learn that Lieut. Goodiff has converted the sabre of war into the spade of the husbandman. I hope he may find more satisfaction in nourishing than in destroying his fellow-creatures, and that instead of the blood-stained Laurel, his brow may be adorned with a richly gemmed cereal wreath as the reward of his mental and manual labours, both in the pages of the *Agricultural Gazette*, and the wide farm-garden he is now cultivating. Fearing, however, that his benevolent efforts to encourage and assist the poor desponding occupiers of small farms may not receive that attention they deserve, and do the good they ought to do, in consequence of their coming from one who has had more experience in drilling soldiers than acres of corn, and more to do with military manœuvres and inspecting open columns of red-coated men than wide spaces in large yellow-grained cornfields, I wish to recommend my brother farmers to read Mr. Goodiff's excellent letters again, and, after considering them well, try his plan. After an experience of nearly half a century, during which I farmed both on a small and on a large scale, I have retired and gone about to see how the farmers were doing in distant parts—a privilege which tenant farmers can seldom find time and money to enjoy; and from my own experience, and the practices I have elsewhere noticed, I am thoroughly convinced of the benefits which Mr. G. so clearly and forcibly exhibits and explains as the consequence of a far more liberal expenditure in manual labour than has yet been practised on little or large farms in the way of deep and wide-rowed cultivation. As an old tenant farmer, I am convinced that, with present prospects, the farmer must have no more land in tillage than he can manage in as perfect a manner as a well-cultivated market garden. Instead of half working his tillage ground, let half his land be either taken away from the farm or sown down for pasture, and the other half doubly cultivated. I mean that the subsoil and top soil should both be cultivated, changing places annually. By this means, and by digging or trenching between very wide rows, I am convinced that as much produce may be obtained from half the land as was formerly produced on it all, and that the additional produce will pay for the additional labour. I have found, that where formerly only two light crops were grown in three years by draining, trenching with the spade or plough, drilling and hoeing, the land has produced three or four good crops in the same time in which it used to produce only two bad ones. I have also found it a good practice to grow Turnips, Carrots, or other green crops, in alternate rows with Beans or grain crops, having intervals wide enough to admit the plough between the rows; but I strongly recommend the substitution of the spade and the fork occasionally in lieu of the plough, particularly in winter, when hands are plentiful. Having long since recommended such practice, I should not now have repeated the recommendation, had it not been for a wish that my brother farmers, for whose sufferings I feel, should be benefited by the really useful letters of Mr. G., who will not be displeased, but encouraged by the opinion of *An Old Farmer.*

*On Tares or Vetches.*—Vetches are one of our most important green crops, thriving best on heavy soils; and when well manured, or fed off with sheep on the land, the Wheat or other crop sown after them will be as good as after a Clover lea, and they may be compared in their effect on heavy land to Turnips on light. A good crop of Vetches may be said to be equal to one of red Clover, for which it is likewise an excellent substitute as a variation to the four-field course, by preventing the too frequent recurrence of Clover on the same land. By sowing Tares from the beginning of autumn to the end of spring, a succession may be had throughout the year both to cut green for soiling horses and for sheep in fold, for whom they should be mown and forked into moveable racks, which will thus ensure all being eaten clean up. Although Vetches are a very good laxative for horses in summer, they are not equal to Lucerne, which is now gaining ground very much, from its great luxuriance and quickness of growth, shooting up directly after being cut, and affording three or four crops in the year; so that, without giving up the growth of Vetches, it might be useful to combine the two on a farm, as well as Saintfoin, another species of the same family. Lucerne, like Vetches, flourishing best on deep soils; it has a tenacity of remaining in the soil. After the May crop of Vetches are fed off, Turnips may follow, which being in their turn folded off, leave the land in good condition for Wheat, winter Beans, or Barley, according to choice. In the neighbourhood of London Vetches are cut in May, after which the land being immediately ploughed is planted to Potatoes, Mangold Wurzel, or Swedes, to be off in time for Wheat sowing. They should be sown on well pulverised land; if after Wheat, the land should be deeply ploughed and scarified, as well as, if necessary, manured, and when up, hoeing may be advisable, having given the Vetches plenty of room in the drills for working between, according to the Tullian system, and, in fact, it is observable in the case of Tares, Lucerne, and other wide-spreading crops, that the wider they are apart in the rows, the thicker they spread eventually, and this must apply to some extent to corn crops as well, which thus is equivalent to thin sowing, varying in its effects on different soils and seasons. There are many varieties of the Vetch or Tare, but only the common Vetch is used with us, as being most suited to our climate. In the south of France, they have a white Vetch, a perennial, grown for the sake of its seeds, from which soup is made; it grows in light soils, and is not affected by frost; it also goes by the name of the Canadian Lentil. Another variety is the yellow Tare, an annual, flourishing in stony soils and among bushes; it covers the ground very thickly, and is cut twice in the year. The Vetch, or as it is termed in Scripture, the Fitch, is found in every country, and in time of famine, has, in times of old, been used as food. In Judea, it is given to pigeons, who are fond of it. The Tare of Scripture has no affinity to the Vetch; in the parable in which Tares are mentioned as being sown amongst the corn, Matt. xiii. 25, the plant called in the East the Zizania, is considered to be the Tare. "It grows amongst the corn, which it resembles, but is rougher; the reapers do not separate it till at threshing time, when, from having no husk, it soon is sieved off; the same reason makes it so easy, from its lightness, to be scattered among growing corn: if eaten, the Zizania, or Tare, produces sickness."—(Rev. S. S. Wilson's "Travels in Judea.") In my last paper on the subject of Turnips and Mangold Wurzel, I did not consider that the too early sowing the Swede would be liable to bring it to too early a maturity, subjecting it to the risk of mildew, and am obliged for your mentioning it. A slight erratum occurred in the same Paper, in mis-spelling the place called Kingweston alluded to, which by an error of the printer's was put down as Tringweston, which I am not aware exists. Since last Paper I have put in some Mangold Wurzel, on the plan I mentioned, with a cupful of superphosphate of lime and ashes to each seed, which is now beginning to appear, but wants more rain to bring the plants up regularly. I have also tried the same experiments in a garden, with various vegetables; trying some seeds with bones, others with guano, both mixed with ashes. I am not aware which is considered the best manure for Parsnips; I have dibbled some according to the above plan with the seed on manure, but should be glad of any extra information on the subject, and meanwhile must wait for time to give a further report of these experiments. *H. E.*

*On the Culture of Buckwheat.*—Buckwheat is supposed by some to have come originally from Africa, but it is generally allowed that we derived it from Asia. In China and Japan the flour of Buckwheat has been long made into cakes. It is not indigenous in Europe, though it has found its way into most of the European Floras, and occurs on dung-hills, and about cultivated fields. In England it is certainly not indigenous, nor will it bear the rigour of our winters. It flowers in July and August. The seeds of Buckwheat are very white in colour, and yield a fine flour, of which thin cakes are made, and are said to be nutritious, not apt to turn acid upon the stomach; whole or unbroken, and mixed with chaff, bran, and grains, the seeds have been reckoned excellent for horses, and that a bushel is equal to two of Oats. The herbage cut green, just before blossoming, is said to flush milch cows with milk, but sheep become unhealthy when eating it. In Sweden, cows, sheep, and goats, are kept upon Buckwheat, but swine and horses refuse it. The seed is excellent food for poultry, and any merit of the plant rests upon that property. A field of Buckwheat furnishes a rich repast for bees late in the season; hence Duhamel advises to move the hives in the autumn to a situation where plenty of this plant is sown. Buckwheat requires land of at least a medium quality clear of weeds, and in good heart. The most general and approved culture is to sow the seed in two bushels on an acre in the first half of the month of May, on one ploughing of a Barley stubble that has succeeded a duly performed Turnip fallowing of the land, or after a crop of winter Tares. The seed is covered by the common harrowing. The crop seldom ripens before Michaelmas, and requires much harvest room. The stems are succulent and retain much moisture, and in wet harvests the crop is often wholly lost or preserved with much difficulty, even in ordinary seasons. The crop is best cut by the scythe, and the swathes repeatedly turned over for the purpose of being dried. The

herbage of Buckwheat grows thickly and rapidly, and smothers and kills any other vegetables. It has been used as a green manure by the crop being ploughed into the ground, and there left to decompose and add a vegetable mould to the soil. In this way the process is much facilitated by the crop being rolled and pressed level to the ground, and is further aided if a quantity of earthy compost could be spread on the surface before the ploughing is done. But this mode of fertilising land has not gained any repute in Britain, where the climate is too late and rainy to allow the early growth of the succulent crops that are necessary, and the timely development of the decomposing vegetation. The vast accession to the list of fertilisers, in the article of auxiliary manures, will completely supersede such methods of manuring land in this country, and a crop may never be accounted valuable which affords a manure only, and food for neither man nor beast. It is now decided that the haulm of Buckwheat is only to be used for the dung-heap, and the seeds are useful chiefly, if not solely, as food for poultry, and the larger game birds. Hence the cultivation of Buckwheat will not be large, and is restricted to the neighbourhood of the game covers, where it may be very usefully sown in open patches of ground within the plantations, and the seeds ripened and gathered by the birds at pleasure. The crop is alternated with Potatoes, which are thrown upon the surface by the spade in small quantities, as occasion demands. When Buckwheat is grown outside the woods, or on adjoining grounds, the crop is built into ricks on the open spaces of plantations, and the sheaves are thrown abroad to be picked by the birds at leisure. Or the dried crop is threshed, and the seeds placed in wooden troughs for the use of the game. Buckwheat contains :

| | |
|---|---|
| Water ... ... ... ... ... | 18. |
| Woody fibre ... ... ... ... | 18. |
| Starch, gum, or sugar ... ... | 45. |
| Gluten and albumen ... ... ... | 10. |
| Fatty matter ... ... ... ... | 2.6 |
| Saline matter ... ... ... ... | 2·3 |

The leafy shade of Buckwheat places it among the smothering crops, and the fibrous root ranks it among the grain crops ; consequently it is not a proper plant of any of the above distinctions, and fails to hold a place in the list of the useful plants. The crop of seed is from 4 to 5 quarters per acre. *J. D.*

*Measures.*—Observing in your Paper a request to forward the various measures, I send you that of this country—the Welch acre, which consists of

| | Square yards. |
|---|---|
| 80 perches of 8 square yards, or 64 yards × 80 perches, equal to ... ... ... ... ... ... ... | 5120 |
| English imperial acre ... ... ... ... ... | 4840 |
| Difference ... ... ... ... | 280 |

The Welsh bushel consists of—Wheat, 3 old bushels ; Barley, 3 old bushels ; Oats, 6 old bushels. *J. T.*

*Turnips.*—In your *Gazette* of the 17th, "H. E." asks why we may not sow Turnips in April, and you answer, that too early maturity will produce mildew in the south of England. But this is not all ; in the north of Scotland Turnips sown before the middle of May are apt to run to seed, which, as everybody knows, is hurtful to them, drying up the roots so that they are little better than dry wood. I am aware that the cause of a light crop is oftener too late than too early sowing. But if we take the advice of "H. E.," we shall find that an April crop is inferior to a July one, if not in bulk, at any rate in quality. But here let me notice "H. E.'s" remarks upon dibbling, *versus* drilling. I cannot help thinking that the estimated expense of each operation is a little at fault. Suppose in dibbling each plant was to occupy 3 feet. In that case there would be 14,520 pints manure used per acre, or 227 bushels, or say five cart-loads, which is the same quantity that he recommends for drilling. Now, I find in the experiment that one horse carries manure for $2\frac{1}{4}$ acres dibbling ; and for drilling, four horses carry for only 6 acres (I suppose the remainder of the seven horses are drilling). And it must be poor work for three horses to drill only 6 acres a day ; it is not too much to say 9. As "H. E." has adopted the estimate, perhaps he will explain ; and I must notice the plan that he recommends of marking the rows with the drill, previously to ridging up for them. This is surely homely farming. It reminds me of a ploughman that laid a line to enable him to go straight, and by holding the plough handle to it, managed to make a furrow with no straightness in it, but just like a bow. He must be a poor hand indeed, that cannot gauge a 27 inch drill by his eye. Now, a word as to dibbling in general ; to do it anything like right, a very careful hand must be employed, and with any of the implements that I have yet seen he must have some mechanical knowledge, for they often get out of order. But even in a perfect way several seeds will be deposited in one hole and will come up in a clump, and in hoeing will be difficult to single. While, if the seed is drilled, it will be divided over the ground more equally, and the plant will come up stronger. And if an agreement is made with the hoer to fill up any blank as he singles them, a fine equal crop will be secured. And this can be done at little or no additional cost. *G. S.*

*Patent Harrows.*—In your description of the agricultural implements in the Great Exhibition, you mention Sanders and Williams' harrows. I think it is but fair that you should state that I am the inventor of this implement. The patent was taken out by Sanders, Williams, Taylor, and Armstrong, and at the Patent Office you will find their names as the patentees, and mine as the inventor. *Samuel Lawrence Taylor, Cotton End, Bedford.*

*Black Wheat.*—A grain of black Wheat was found by a young gentleman, of Toronto, in the crop of a wild pigeon he had killed. The ear produced from this grain was given to Mr. Harry Turner, son of Colonel Turner, K.H., of Bamby, near Toronto ; by him was given to his father, and planted at Bamby in the spring of 1847. It came up almost like Grass in the summer of 1847, but was allowed to remain through the winter ; and during the ensuing spring (1848) came to perfection, being fall Wheat. The single grain, by 1850 (August), had multiplied itself by planting, during four years, into a large sheaf, containing many hundred stalks. Given to me at Bamby, on the 10th Sept., 1850. *H. P. P. C.* [The annexed is a drawing of the specimen sent.]

*A Word in Season.*—Should Mr. Nicklin and others who are growing grain crops on the bed and alley system, recommended by Mr. Smith, think the fallowed alley in it, lying uncropped, a waste of space, and would like to grow a green crop thereon during the summer months, it is my opinion they could not do better than to fork in a little manure the last time the alley is forked over, and immediately after the last stirring plant a row of Early York Cabbage, which would be ready to come off before the time of sowing Wheat. The Cabbage should be planted 18 inches plant from plant, and were they to average say 4 lbs. each, they would produce 23,232 lbs., or 10 tons 7 cwt. 48 lbs., of green-meat per acre — a weight sufficient to last four cows, supposing they were to eat 80 lbs. each per day, 10 weeks and two days. If the growing of Cabbages would not injure the present nor the after crop of Wheat, I think the experiment would certainly be worth a trial. When I have grown them between double rows of Beans, they have done well and grown to a large size ; and I have grown good crops of Wheat after them. I have twice had the pleasure of walking over Mr. Smith's farm, but unfortunately was too late in the season to see his Wheat standing, but I saw from the very strong stubble and stoolings he must have had a surprising crop. I here saw the very best crops I ever saw of Swedes, Mangolds, Carrots, and Parsnips, and winter Beans interlined with Cow-Cabbage ; these crops were really magnificent. Parties really interested in spade husbandry, who should feel disposed to visit Mr. Smith's farm during the summer, would be equally as much interested in his system of growing roots, as they would in his system of growing Wheat. Both systems decidedly merit the serious consideration and attention of all cultivators of the soil. *W. Griffin, Eydon, near Daventry.*

*The Value of an Acre of Roots* is the result of many circumstances, and climate so far alters the quality, that a comparison of crops raised under widely different latitudes must be unfair ; but there is less, if any, reason why the quantity should vary so much as it does in Great Britain, or even on two adjoining farms, under the like advantages of climate, soil, drainage, manure, and tillage. The various numbers of roots and the unnatural modes of adjusting them over an acre, militate against obtaining a maximum of produce. Drills, varying in width from 18 to 36 inches, and the plants thinned out to from 10 to 18 inches apart, are practices sufficient to cause difference enough. Some of the heaviest crops grown are recorded as having been raised on 27 inch drills, and 12 inches apart—19,360 plants per acre—which is by far the most general and approved method. Nevertheless, a plant could not be placed in a more disadvantageous position, when we consider the desired result—bulbs ; if the object were to grow leaves, then the practice would be correct, for the great preponderance of lateral play-ground encourages, nay, compels the plant to waste its energies in the production of leaves. I would suggest, as a subject highly desirable, comparing the results of roots grown as customary, and in various sized squares, say drills 12 inches by 12 inches apart, 15 by 15, 18 by 18, 21 by 21, and 24 by 24 ; the elementary source of food being the same. A few carefully conducted experiments, in different localities, will be a useful addition to our agricultural knowledge in seeking for truth. And although, as I apprehend the best yield may be found from drills too narrow to admit of culture with our present horse-hoes, that is a seeming objection which will soon vanish before the exertions of our mechanics, when the farmer has once stamped the dimensions *best* suited to his object. Three feet drills by $1\frac{1}{2}$—$4\frac{1}{2}$ square feet to one plant, or 9680 roots per acre, which is practised in parts of Cumberland, *must* be wasteful, at least for the first four months' growth ; and I believe these proverbially "cannie chiels" would find it to their advantage to allow more plants, and if the scale-beam denotes that in their climate the greatest weight is obtained by such wide intervals, to draw out and convert to useful purpose the thinnings, or to interline the Swedes with white Turnips. There is perhaps no general unpractised method which would so much add to the acreable yield of our root crops as this. But the trouble of carrying them off ! Yes : practice is churlish. Ingenuity must devise the best means, and figures proclaim whether the result is profitable. In the south of England, where the time of sowing must be late, narrower drills are preferred ; yet it may admit of doubt whether using half-grown thinnings would not be so much additional to the produce. Whatever influence climate and season may have upon the Turnip to require more or less space, it must be wrong in practice, and a waste of rent and raw material to make that space a parallelogram instead of a square. *T., May* 15.

*The Working Classes.*—There are so many contradictions in human nature that few things cause astonishment ; but though it may not surprise those acquainted with the manners and practices of the lower orders of our fellow-creatures, yet the reckless way in which hard earnings are squandered away in public-houses, offers a subject for serious consideration and reflection, and produces painful feelings of regret and disgust at the profligacy of mankind. Let the times be good, bad, or indifferent, as fancy dictates, the beer-shop never wants customers ; and many a family is brought to ruin and want by the debasing vice of drunkenness. It is deplorable to witness the utter want of principle which induces a man to sacrifice the comfort of his wife and children, and his own respectability, to gratify his brutal appetite for intoxicating liquors ; making himself lower in the scale of the animal kingdom than the horses he drives or the pigs he feeds. A human creature who indulges in the practice of steeping his senses in maddening draughts of fermented poison, is outraging common decency, and disobeying the laws of God and man. For the present, laying aside the higher views of the sin of drunkenness, let us consider how far an individual is performing his duty as a member of society. We all belong to the great family of mankind, and have in childhood experienced the fostering care of our country, in the protection of the law, and the benefit of charitable institutions ; if not directly in our own persons, yet indirectly, through our parents. Surely, a knowledge of these facts should have some influence over the feelings of a man who has the commonest intellect. Too many, in all classes of the community, pass their lives as if they were not accountable for their actions to their fellow-creatures. This is a great mistake, and leads to innumerable evils. The various grades of society are dependant upon each other, the poor on the rich, and the rich on the poor, the idea of equality, excepting as far as regards religion, and the laws, is an absurdity, not worthy of a moment's consideration. The fact of our requiring assistance from one another, proves that we have no right merely to consult our own humours, without reference to our neighbour's benefit. This golden rule being admitted, let us ask a simple question, have we any authority permitting us to destroy the intellect which our Maker has given us ? Every man, no matter how humble his station may be, has a part to perform (for which he must be answerable) in the great family of the human race ; and he is useful, or worse than useless, according to the manner in which he carries out his duty. Half a day's work, or a quarter of a day's work, is better than idleness, and living upon charity, taking the bread out of the mouths of the sick and the young. Poor-houses are only intended for the afflicted in body or in mind, and not for the able-bodied labourer. The root of almost all evil in this country may be traced to drunkenness ; the hospitals are crowded with victims brought to the lowest stage of suffering, through their practice of a habit which sooner or later will undermine the constitution. How few sots are ever reclaimed ! And where one arrives at a good old age, 99 die prematurely. Drunkenness, although more prevalent amongst the labouring classes, yet exists amongst the middle and higher orders of society, not to the extent it did some years ago, but sufficient to show a bad example to those who ought to look up to them for advice and assistance in time of need. What pleasure can an individual derive from rendering himself unconscious ? And that the drunkard does so, the police reports are a sufficient evidence. Many excuse their outrageous conduct by pleading the effects of liquor, which is however of no avail, being rather an aggravation of the offence than otherwise. The annals of crime will tell a sad tale against the drunkard. The hospital register shows how the drunkard's life is shortened. The comforts of domestic life are blasted by the drunkard. Society is insulted by the drunkard. The wretchedness, misery, and sin of many a wife and child fall heavily on the head of the drunkard, and curses loud and deep follow him to the grave. Surely there must be some means of checking the prevalence of tippling. The revenue might suffer from the decreasing consumption of poison, but mankind would benefit immensely. *Falcon.*

## Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A LECTURE, on the agricultural employment of common salt, was delivered before the Members, at a Weekly Council, held at the Society's House, in Hanover-square, on Wednesday, May 14 (the Hon. ROBERT HENRY CLIVE, M.P., Trustee, in the chair) by PROFESSOR WAY, the consulting chemist to the Society.

ON THE USE OF COMMON SALT IN AGRICULTURE.

MR. WAY commenced his lecture by adverting to the circumstances under which it was given. A few weeks ago, at a meeting of the Society, one of its members, Baron Mertens, expressed the desire of his (the Belgian) Government, to elicit from English agriculturists, their experience with regard to the use of salt; and at the suggestion of Mr. Fisher Hobbs and other gentlemen, it was arranged that it should form the subject of a lecture to be delivered by the chemist of the Society. He (Mr. Way) had great pleasure in appearing before the Society, in accordance with their request, but they must not expect him to bring before them anything particularly novel on the subject. The question had been repeatedly discussed by able men in lectures, books, and special essays, particularly at the period when the removal of the duty on salt was contemplated and effected; and more recently, when a like measure was proposed by the French Government. To reopen the question in detail would require not one, but several lectures, and he considered that, under the circumstances, the wishes of the Society would be best carried out, if he simply recapitulated the various conditions in which salt had or had not been beneficial as a manure, and the no less various opinions which were held as to its mode of action. It was with the last that his business chiefly lay, and in reviewing them, he should pass rapidly over those which were open and palpable, and give his chief attention to those others which, from their obscurity, were more worthy of investigation. Mr. Way should endeavour to compress what he had to say into the space of half an hour, in order that those whose practical experience it was so important to obtain, might have an opportunity of communicating it to the Society.

The combined experience of those who had obtained favourable results from the use of common salt went to prove:—

1. That common salt improved the quality and weight per bushel of the grain of Wheat, Barley, and Oats.

2. That it strengthens the straw of these cereal crops.

3. That it increases the crop and improves the quality of Swedes, Turnips, and Carrots, and still more of Mangold Wurzel.

4. That it improves the quality of the Grass in heathy pastures, and makes it more palatable to stock.

5. That it kills wireworms and slugs, and destroys noxious weeds.

6. That it promotes the health of animals when given with their food. Common salt has also been found beneficial to Potatoes, Peas, &c., but not so commonly as to the other crops mentioned.

Now, in order to establish the fact of the beneficial action of salt, it was not necessary, in Mr. Way's opinion, that every person should have obtained a similar result; nor was it necessary even that a multitude of instances of success should be adduced. One experiment, intelligently carried out and truthfully reported, was sufficient to prove that salt has, in certain conditions, a beneficial effect upon crops. On the whole, however numerous may have been the cases of failure (and it is to be remembered that failure is less often reported than success), it must be allowed that there was ample evidence to prove that common salt exercises some influence on vegetation, and it was worthy of observation that when employed in moderate doses, this influence has rarely been found to be noxious or prejudicial. The question then was as to the nature of that influence: that salt kills wireworms and slugs, if a fact, is one of those facts which needs no demonstration or discussion; that it destroys weeds is of the same kind, other plants equally suffering from its effects when used in excess. But in what way does it improve the quality of Wheat? in what way strengthen the straw of corn crops? of what nature is its influence upon Turnips and Mangold Wurzel? these are the points which demand the attention and investigation of science.

Now the advocates of common salt have been in the habit of explaining its action by reference to many different properties. They have called it a stimulant to plants. This is in reality no kind of explanation, but only the assertion of the fact. Common salt is observed to cause an increased and energetic vegetation, and it is therefore said to stimulate; but how it brings about this result we are not told. The property of salt of attracting moisture had also been referred to as accounting for its action. There was no doubt that salt did increase the proportion of moisture in the soil, but to a very small extent. Mr. Way had made a calculation by which he found that 20 bushels of salt applied to an acre of land, would, if it attracted water till it was entirely dissolved, add only half a per cent. of moisture to that ordinarily present in the soil. An experiment made by Mr. Cuthbert Johnson, and quoted by him in his excellent essay on the use of salt, as proving the increased absorption of moisture caused by salt, only showed that this effect was really insignificant. One thousand parts of a dried soil, that by exposure to the air for 18 hours gained 25 parts of moisture, was found by Mr. Johnson, when salted at the rate of six bushels an acre to gain 26, and at the rate of 12 bushels, 27 parts of moisture in the same time. Mr. Way did not think that the property of salt to attract and retain moisture went far to explain its beneficial effects on land, and the same was true in a lesser degree of muriate of lime or any other deliquescent salt which it might give rise to in the soil. Then it has been supposed that common salt is a direct food of plants; that is to say, that it is necessary to enable them to build up their organs, in the same way that phosphorus and sulphur are now known to be indispensable elements of vegetation. Were this actually the case, the whole question would be set at rest. Supposing that common salt existed in every kind of vegetable in such definite quantity as to lead to the belief that it was a component part of their organised structure, then plainly its existence in the soil in some shape or other would be absolutely necessary for vegetation; and we could readily understand how its artificial supply would in some instances have the best result; this point, therefore, demanded attention.

The analyses of the ashes of plants had shown, that whilst common salt was present in very large proportion in Mangold Wurzel, Carrots, Turnips, and such-like plants, and in lesser, although still considerable quantities in the Grasses and the straw of different corn crops, it was almost, and in some cases entirely, wanting in the seeds of plants. Thus by the table to which he directed their attention they would see that, whilst 1000 lbs. of Mangold Wurzel contained as much as 37 oz. of salt, the same quantity of Wheat furnished only 1 oz.; indeed the last figure was a manifest exaggeration, since in the ash of 26 samples of Wheat examined by him, only four cases had occurred in which common salt could be detected at all, and the amount mentioned above was the average of those four cases. This was a very important fact, and one which must be steadily kept in view, in attempting to discover the part played by salt in vegetation. If it was contended that common salt was part of the food of plants (and it must be remembered, that in speaking of the food, at all events of the *mineral* food of plants, we could only be guided by what we found in them), then how came it to be absent from the grain of Wheat in 22 out of 26 instances?

Mr. Way observed that it was at all times dangerous to generalise to too great an extent, and therefore it might hardly be safe to say that what applied to Wheat must also apply to Mangold and Turnips; that since common salt was not a necessary ingredient of Wheat, its existence in such large quantities in Mangold was also accidental; but it must be allowed that the nature of the respective plants in some measure justified such a conclusion. The grain of Wheat, for instance, contained, when ripe, from 10 to 15 per cent. of water, and 85 or 90 per cent of dry matter. In the Turnip or Mangold, on the contrary, the state of things was entirely reversed; in these roots, for 10 or 15 per cent. of dry vegetable matter, we find from 85 to 90 per cent. of water. It was reasonable to suppose that this water would contain a portion of any soluble salts existing in the soil, and quite evident that from the quantity of water present in the Turnip or Beet, we must expect to find in these roots a considerable amount of substances having nothing whatever to do with vegetation.

The seeds of plants are, when ripe, individually perfect, which no other parts of plants are. The stems and other solid parts have always in them the unmatured and circulating juices in all states of transformation. On the other hand, in the seed of a plant, every portion seems to become fixed. As the period of final maturation approaches, all substances not actually required for its well-being are excluded and expelled from it. Finding phosphorus and sulphur, magnesia and potash, in large quantity in the ripened seed, but failing to detect common salt there, we are justified in supposing that the former substances are, and that the latter is not, indispensably necessary as an element of vegetable nutrition.

It remained to be seen whether the presence of common salt in the root crops is to be accounted for on the supposition that it is really an element of their food; but, in the meanwhile, Mr. Way wished to call attention to the circumstance, that, although common salt, as a whole, might not constitute any portion of the food of plants, the alkali which it was capable of furnishing might yet be of great importance to vegetation. Common salt is the muriate of soda, that is to say, the alkali soda combined with muriatic acid. Now, it has been already shown that this compound is not a necessary constituent of the grain of Wheat. In the analyses of Wheat-ash before mentioned, soda was generally detected in small quantity; in comparison, however, with that of potash, the proportion was so minute as to lead to great doubts whether soda was indispensable to the crop in question. In the root crops soda is frequently found in large quantity in other forms of combination besides that of the muriate; but even here its presence was not constant, for he (Mr. Way) had examined several samples of Turnips in which no soda existed beyond that combined with muriatic acid.

Taking these two circumstances together—the entire absence in some cases of common salt from seeds and the equally well-ascertained absence of other salts of this alkali from Turnips and other root crops—he was inclined to think that the theory which supposed common salt to be directly or indirectly—either as a whole or as a source of soda—a constituent of the food of plants was not satisfactorily made out.

It only remained, therefore, to examine in what way salt could act as an agent of vegetation. The French had an excellent method of classifying the substances used as manures. With them only those substances were called "manures" which were known to operate by supplying some of the elements requisite for the nutrition of plants; thus ammonia and its salts would be manures as supplying an element (nitrogen), entering into the composition of plants. Those other applications which contribute to improve the texture of the soil, and to bring into play its dormant energies, are known as "amendments" or "improvers." Sand added to a heavy soil would be of the latter class, as would lime, because although it is certainly part of the food of plants, we evidently use it with other views when we apply it in such large doses to our fields.

Salt, then, having failed to prove its claim to be ranked under the first head in the French agricultural vocabulary, it remained to be seen whether it operates as an indirect agent in vegetation. Indeed, granting the efficacy of salt as an application to the soil, this was the only other way of accounting for its effects. It had been said that salt in small doses hastened putrefaction, and that in this manner it was capable of furnishing the growing plant with a more abundant supply of vegetable and animal food. Mr. Way had no personal knowledge of this property of salt, and the assertion did not appear to him to be altogether free from doubt. But at all events it so happened that the soils upon which salt has been most successfully employed; that is to say, the light and open soils, were precisely those in which the decay of manure is very rapid, and in which consequently there would be less necessity for the kind of assistance which salt was considered capable of affording. Although he did not intend to deny the possibility that salt might be beneficial, in consequence of the property imputed to it of decomposing vegetable matter, Mr. Way observed that we must seek some further explanation of its action.

He had now to bring before their notice a property of salt, which, so far as he could learn, was entirely new. When a portion of a soil is shaken up with water, and the mixture allowed to stand till it gets clear, or is otherwise rendered so by filtration, the presence of a little lime, in the state of sulphate and other soluble salts, will generally be detected by the proper tests.

If instead of water, a weak solution of common salt was employed, the indication of lime in the liquid would be immeasurably greater than in the other instance. Now if common salt was acted on by soils in the same way as salts of ammonia and potash—its base, soda, being absorbed by the soil, and lime uniting to the muriatic acid—this dissolving out of lime would be of easy explanation.

Mr. Way had, indeed, on a former occasion, stated that soda was subject to the same law of absorption as the other bases mentioned, but he had at that time made no very definite experiments on this subject. Subsequent investigations had shown him that some soils, at all events, have no power of retaining this alkali, and the soil which he had just used before them was such an one; it did not absorb soda from common salt. How then were they to account for the quantity of lime dissolved? At present he was not in a position to say with authority; but as he had proved to his own satisfaction that it did not arise from the presence of any of the ordinary salts of lime in the soil, he was led to believe that the common salt acted on certain silicates of lime present, in a way as yet not understood; and at the same time as it afforded a supply of lime to plants, gave rise probably to a modification of silica important to the straw of the cereals. But leaving out of the question this latter possibility, the mere increase of the quantity of lime in a soluble condition, might itself go far to account for the effects of salt. Our whole system of agriculture was an attempt to heighten and increase the energy of those causes which operate naturally on a smaller scale. The appointed solvent of lime was probably carbonic acid, but it is easy to conceive that the artificial cultivation of certain crops would require more copious supplies of this substance, than could be furnished by the usual methods. Salt may, at this point, step in, and meet the emergency in a way consistent with the functions of the plant, and minister to the artificial wants of the crop in an unusual and artificial manner. Mr. Way was at present following up these experiments, from which he hoped to derive some information.

It would be seen then, that the presence of large quantities of common salt in root and other crops, might be only a secondary result due to this substance, having been executing its office as a solvent, and thus introduced into the juices of the plant.

Having now taken the liberty of adding another theory to the already too large list on the action of common salt, and having expressed his opinion in favour of those views, which held it to be an *agent* rather than an *element* of vegetation, he would leave the further discussion of the question in the hands of the meeting.

## Notices to Correspondents.

ASHES: *W.* Burnt clay soil mixed with ashes of weeds is good manure for Turnips. Sea-weed may be mixed with dung in compost for Turnips. It is better used when still succulent than when dried.

CLAYS: *R W C.* We regret we have not the time necessary for the analysis of the specimens sent. Any of them will, no doubt, improve a light soil; and 25 cart loads is not a heavy dressing—quite otherwise. It is a good thing to cut hay into chaff before giving it to horses. The machine called Corne's, made in Cheshire, and now copied by most makers, has for some years received the prize of the English Agricultural Society.

GREEN MANURING: *C D.* Mustard might be sown now, to be ploughed in as manure in autumn.

MANURE: *J N.* We are not acquainted with the manure advertised in the prospectus you have sent.

PRINCIPLES OF THE TENANT RIGHT BILL: *J P.* The principle was simply this, that a certain period of years should be assumed respectively for temporary improvements by the purchase of artificial manures, or durable improvements by draining, marling, irrigating, &c., in which period, if the tenancy lasted so long, the tenant should be deemed to be compensated; but should receive, if he left earlier, money in proportion to the number of years unexpired. The bill was brought in to give the tenants this right absolutely, but the opponents took it away, in case of the tenants' giving notice. There was a further important clause, giving the tenant the absolute right of removing buildings put up by him, unless the landlord took to them at a valuation.

RATTLE GRASS: *X Y Z.* You had better keep the Grass eaten down closely for a year or two by sheep. This would ripen and shed its seed in hay harvest. Charlock may be extirpated by perseverance in pulling it annually.

SCOURING IN YOUNG PIGS: *J R R.* Prepared chalk, 1 dr.; powdered opium, 3 grs.; powdered ginger, 5 grs.; to be given twice a day in thick Wheat flour gruel. *W. C. S.*

TANK WATER: *C D.* You might deliver the liquid over a lot of charcoal dust, and spread it in the compost form. It would be then inodorous.

TRIFOLIUM INCARNATUM: *A Constant Subscriber* will feel greatly indebted to any of our readers by answering the following questions:—Does the Trifolium incarnatum seed freely? and what is the average quantity of seed per acre? In what month is it generally cut for seed? and is the haulm good for chaff?

METEOROLOGICAL REPORT.—MAY—JUNE.

* Continuation of previous storm.

† A different storm from the former, passing a long way to the westward from Newfoundland towards Iceland.

‡ A storm from Bermuda, passing over Lisbon and the north of Spain.

§ A storm travelling from west to east, centre lying to the northward; and probably of very large diameters, extending a long way to the northward, from the intense cold.

Dorchester, June 5th. *F. P. B. M.*

(*To be continued.*)

# Markets.

COVENT GARDEN, JUNE 7.

Trade is somewhat brisker. Peaches, Nectarines, and Cherries may be obtained at high prices. Hothouse Grapes are plentiful and cheap. Pine-apples are more abundant, and there is a quantity of West Indian ones in the market; they fetch from 2s. to 6s. each. Strawberries are good in quality. Dessert Apples are over for a season. Oranges and Lemons are plentiful. Nuts remain nearly the same as last week. Vegetables of all kinds are abundant. Asparagus, young Carrots, French Beans, and Green Peas are received in quantity. Frame Potatoes may be obtained at 4d. to 1s. per lb.; old kinds realise high prices. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1s. per pottle. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis floribunda, Cinerarias, Moss and Provins Roses.

FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 8s to 12s | Lemons, per doz., 1s to 2s |

| Leeks, per bunch, 3d to 4d | |

HOPS.—FRIDAY, June 6.

Messrs. Pattenden and Smith report that the accounts received this morning from the Hop plantations speak of an alarming increase of fly generally throughout the grounds. Our market is in a very excited state, and prices have advanced 2s. to 4s. per cwt. on all descriptions of Hops. Duty estimated at 130,000*l.*

COAL MARKET.—FRIDAY, June 6.

Holywell, 13s. 6d.; Eden Main, 13s. 3d.; Hartley, 13s.; Wallsend Haswell, 14s. 9d.; Wallsend Hetton, 14s. 6d.; Wallsend Lambton, 14s.; Wallsend Tees, 14s. 6d.—Ships at market, 177.

POTATOES.—SOUTHWARK, June 2.

The Committee report that there have been several fresh arrivals since our last report; trade continues very heavy, and, with second-rate Potatoes lower prices are submitted to. The following are this day's quotations:—York Regents, per ton, 60s. to 90s.; Scotch do., 50s. to 75s.; ditto Cups, 60s. to 80s.; Scotch Catholics and whites, 40s. to 50s.; Lincolnshire whites, 40s. to 50s.; foreign do., 45s. to 60s.

SMITHFIELD, MONDAY, June 2.

The supply of Beasts is not large; we have a cheerful trade, and 3s. 8d. is made in a few instances, but this is too much to quote as average of choice quality. There is a considerable increase in the supply of Sheep; trade is dull, and prices rather lower. Lambs are in demand, but prices are not higher. Trade is heavy for Calves. From Holland and Germany there are 203 Beasts, 1920 Sheep, and 208 Calves; from Norfolk and Suffolk, 2200 Beasts; and from Scotland, 200; from Spain, 150 Sheep; and 40 Pigs from France.

| Per st. of 8 lbs.— | s | d | s | d | Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|---|---|---|---|---|
| Best Scots, Herefords, &c. | 3 | 4 | to 3 | 6 | Best Long-wools | 3 | 4 | to 3 | 6 |

| | | | | | Calves | 3 | 0 | — 4 | 0 |
| | | | | | Pigs | 2 | 8 | — 3 | 8 |

Beasts, 3482; Sheep and Lambs, 31,540; Calves, 334; Pigs, 480.

FRIDAY, June 6.

The number of Beasts is again small and the weather favourable, but we are not able to quote 3s. 8d. as average; however, Monday's prices are more freely given. We have a good supply of Sheep and Lambs; the former are selling rather dearer, the latter are more freely disposed of at Monday's rates. Calves are numerous, but choice qualities not being very plentiful still make 4s. From Germany and Holland we have 162 Beasts, 780 Sheep, 237 Calves, and 90 Pigs; from Scotland, 120 Beasts; from Norfolk and Suffolk, 300; and 92 milch cows from the home counties.

| Best Scots, Herefords, &c. | 3 | 4 | to 3 | 6 | Best Long-wools | 3 | 4 | — 3 | 8 |
|---|---|---|---|---|---|---|---|---|---|

Beasts, 706; Sheep and Lambs, 12,220; Calves, 539; Pigs, 510.

MARK LANE.

MONDAY, JUNE 2.—The supply of English Wheat to this morning's market was small, and disposed of at the terms of this day se'nnight. Foreign met a slow and retail inquiry at our quotations.—Grinding and distilling Barley must be noted 6d. to 1s. per qr. dearer.—Beans and Peas meet an improved demand, and the latter are held for higher prices.—Oats are a good sale at an advance of 1s. per qr.—Flour is a dull sale.

FRIDAY, JUNE 6.—The arrivals of grain, English and foreign, this week have been small, and a more general disposition was evinced this morning to purchase Wheat, which was held for enhanced prices, and thus impeded business.—Barley, Beans, and Peas obtain the extreme prices of Monday.—Oats are held firmly, and in some cases advanced 6d. to 1s. per qr. Flour meets an improved demand at late rates. There is very little doing in floating cargoes from Southern Europe; prices of Wheat and Indian Corn are about the same as last week.

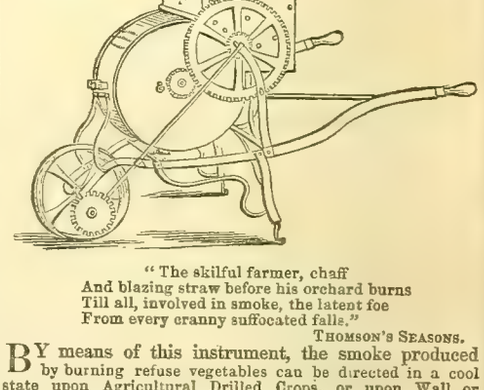
LIVERPOOL, TUESDAY, JUNE 3.—The arrivals since Tuesday last from Ireland and coastwise are moderate of Oats, but light of other articles. At this morning's market there was a moderate attendance of millers and dealers, who purchased sparingly of Wheat, but Tuesday's prices were fully supported. Barrel Flour met an improved demand, and in some instances a small advance was established. Oats were in fair request at an improvement of ½d. per 45 lbs.; but Oatmeal was neglected and without change in value. Beans must be quoted 6d. per qr. dearer. Barley and Peas supported former quotations. Indian Corn met a good demand, at 30s. per 480 lbs. for American yellow from the quay, being a decline of 6d. per qr. on the week.—— FRIDAY, MAY 30.—At our Corn Exchange this morning we experienced a firm and steady market as regards Wheat of all descriptions, and previous rates were fully realised. Barley and Malt, upon a moderate demand, fully supported former prices. Beans were held on rather higher terms, which were partially acquired. No change in the value of Peas. Oats were difficult of sale at barely former rates; and Oatmeal, though rather more saleable, was not dearer. Indian Corn supported late rates.

HORTICULTURAL BUILDING AND HEATING BY HOT-WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which for elegance of design, good materials and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.



PURVEYOR TO HER MAJESTY, H.R.H. PRINCE ALBERT, AND THE KING OF THE NETHERLANDS.

JOHN BAILY, 113, Mount-street, Grosvenor-square, London, Dealer in all sorts of USEFUL AND ORNAMENTAL POULTRY; Domesticated Wild Fowl; Gold, Silver, and common Pheasant Eggs for Hatching; all sorts of Fancy Fowls' Eggs, large Aylesbury Ducks, &c.

BAILY'S registered PHEASANT AND POULTRY FOUNTAINS, by which Birds are ensured a supply of clean and wholesome water, and the lives of thousands of Chickens and Pheasant Poults saved—14 quarts, 17s. 6*d*; 7 quarts, 15s. 6*d*.; 3 quarts, 13s. 6*d*. Drawings and particulars forwarded by post on application.

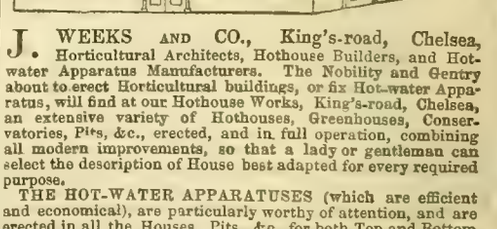
BAILY'S "Hints for the Management and Fatting of the Dorking Fowls for the Table," price 1s. 6*d*.

IMPORTANT TO FARMERS, GARDENERS, AND FRUIT HOP GROWERS.

"The skilful farmer, chaff
And blazing straw before his orchard burns
Till all, involved in smoke, the latent foe
From every cranny suffocated falls."
THOMSON'S SEASONS.

BY means of this instrument, the smoke produced by burning refuse vegetables can be directed in a cool state upon Agricultural Drilled Crops, or upon Wall or Standard Fruit Trees, Hops, &c., and blight or insects destroyed. It is also available for filling large houses with Smoke of Tobacco or other material; disinfecting impure places in ships and buildings; and for eradicating vermin. The machine may be obtained with or without the drilling apparatus.

Manufactured by Messrs. DEANE, DRAY, and DEANE, Swan-lane, London.



Price 6*d*., free by post.

REMARKS ON FUMIGATING HORTICULTURAL AND AGRICULTURAL CROPS.

London: Published by BRADBURY & EVANS, Bouverie-street.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP, AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction at the Mart, Bartholomew-lane, on TUESDAY, June 10, and THURSDAY, June 12, 1851, at 12 o'clock, a first class collection of Dahlias; also the newest varieties of Fuchsias, Verbenas, Geraniums, Heartsease, Climbing and other Roses, and a variety of useful and ornamental Plants for bedding. May be viewed the morning of Sale.—Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

ORCHIDS—THE MOST IMPORTANT COLLECTION EVER OFFERED TO PUBLIC SALE.

MR. J. C. STEVENS is favoured with instructions to submit to Auction, at his Great Room, 38, King-street, Covent-garden, on MONDAY, June 9th, and following day, a collection of ORCHIDS, that has ranked for some years past as one of the finest in the kingdom; it comprises magnificent Specimen Plants, in perfect health, of all the favourite varieties, an enumeration of a few of the principal of which will suffice to show the high character of the collection.

Aerides maculosum
" quinquevulnerum
" odoratum purpurescens
" crispum

" præmorsum
" Blumei major
" calceolaria
" papillosum
Vanda Batemanii
" violacea
" tricolor
" Roxburghii
" teres, &c. &c.

Catalogues are preparing, and will be ready 10 days before the sale.

TO PLANT EXHIBITORS.

MR. J. C. STEVENS will sell by Auction, on TUESDAY next, after the sale of Orchids, at about half-past 3 o'clock, a COVERED VAN, nearly new, built expressly for the conveyance of Plants to and from the Flower Shows, and particularly deserving the attention of Exhibitors. —May be viewed at 38, King-street, Covent-garden at the time of Sale.

ORCHIDACEÆ LINDENIANÆ.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King-street, Covent-garden, on THURSDAY, June 12, at 12 for 1 o'clock, a consignment of ORCHIDS, just received by Mr. Linden, from his collector in New Granada, and comprising fine healthy specimens of the desiderata of that locality; including Uropedium Lindenii, Odontoglossums hastilabium, Hallii nævium, Pescatorei, Schlimmii, and a splendid new species, Sobralia Ruckerii, Oncidiums candelabrum and cucullatum, Cycnoches Pescatorei and Lindleyi, Anguloa virginalis, and many others.—May be viewed on the morning of sale, and Catalogues had.

TO BE SOLD OR LET ON LEASE FOR 90 YEARS OR LESS, TO GENTLEMEN'S GARDENERS DESIROUS OF ENTERING INTO BUSINESS, NURSERYMEN, OR FLORISTS.

TO BE SOLD OR LET, immediately, at Michaelmas, or within 12 months from this date, a very compact Horticultural Establishment, consisting of about 12,000 feet of glass erections, nearly new, having all been erected since 1843. The whole of the Pits and Houses are heated by hot water; there is an excellent Dwelling-house on the premises, in good repair, consisting of 12 rooms, which are so arranged as to accommodate two families, if required. The construction of the houses and situation is very desirable for persons wishing to cultivate Plants for market, or attending to the business of looking after small gardens, being situated on the main road from London to Brentford, and within four miles of Piccadilly. A Lease for 90 years can be granted by the present proprietor, if required, whose great increase of professional business from home is the only cause of this desirable property being disposed of. This offers an excellent opportunity for two persons wishing to enter into the Nursery business.—For further particulars apply to A. Z., at the Office of this Paper.

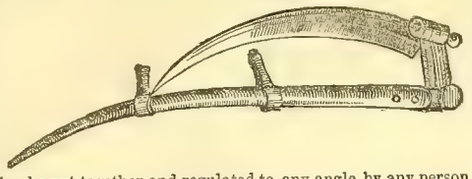
TO GENTLEMEN'S GARDENERS, AND OTHERS.

TO BE DISPOSED OF, 14 years' unexpired term of a snug, walled-in Garden, with Cottage, Sheds, Greenhouse, brick-built Pits, &c. The Garden is well stocked with Fruit Trees, Shrubs, Flower Roots, &c.; it is well adapted for the business of a Florist and Seedsman, in which line it has been carried on by the present Proprietor, who retires through ill-health. Rent and taxes low, coming-in moderate. For further particulars apply, if by letter, pre-paid, to Mr. Baker, Potato Merchant, Broadway, Deptford, Kent.

TO BE DISPOSED OF, with immediate possession, or in Autumn, an old Established NURSERY and FRUIT GROUND, the proprietor retiring from business. It is situated in a populous neighbourhood, six miles from London; the ground is unrivalled for Trees and Shrubs, also for producing the finest Fruit.—For particulars apply to J. C. Hardy, Esq., National Guardian Assurance Society, 19, Moorgate-street, London.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

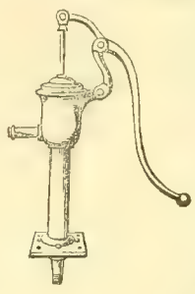
Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.



TO MARKET GARDENERS.

TO BE LET, 12½ acres of FRUIT GROUNDS, 11 miles on the Western Road, in first-rate condition, comprising the choicest varieties of the undermentioned:—Black and Red Currants, Raspberries and Strawberries, Cherries, Pears, Plums, &c. &c. Rent 25*l.* per annum. Stock at valuation. A small House, Stabling, and Sheds on the premises.—For further particulars, apply to Duncan Hairs, Seedsman, 109, St. Martin's-lane, London.

TO BE LET, and entered upon at Michaelmas next, a very desirable FARM, of about 200 acres, situate at Great Coxwell, near Farringdon, Berks, the property of the Right Hon. the Earl of Radnor. Mr. Robert Gerring, the present occupier, will appoint a person to show the Farm, and further particulars may be obtained on application to Mr. Edward W. Moore, Coleshill, Highworth.



AMATEUR STRAWBERRY GROWERS are respectfully informed that HOOPER'S STRAWBERRY TILES, from being made solid, are free from the imputation of harbouring slugs. They are made large and strong, and coloured black, that they may better retain heat.—To be had of Messrs. CHARLWOOD and CUMMINS, Tavistock-row, Covent-garden, London, where they may be seen.

BOYD'S SELF-ADJUSTING SCYTHE,
(Class IX. of the Exhibition),

Can be put together and regulated to any angle by any person in one minute, without the assistance of a blacksmith; shuts up like a knife, and can be carried without danger. It effects a saving of 25 per cent. in labour, and can be used in an upright position if necessary. Manufactured and sold by Deane, Dray, and Deane, Agricultural Implement Depot, Swan-lane, London Bridge; and to be had of all respectable Ironmongers.

FARM AND COTTAGE PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

Patent Pump ... ... £1 16 0
Patent Pump, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing ... ... ... 2 12 0

Larger sizes, if required.

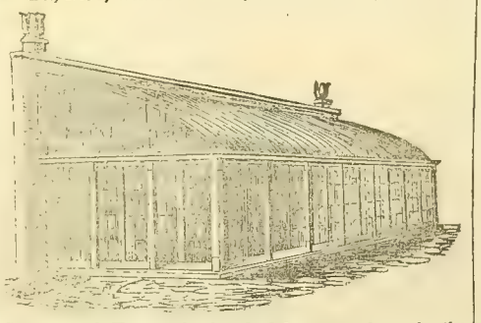
May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,
8, Crescent, Jewin-street, London.

Every description of Machinery for Raising Water, Fire Engines, &c. The usual allowance to the Trade.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

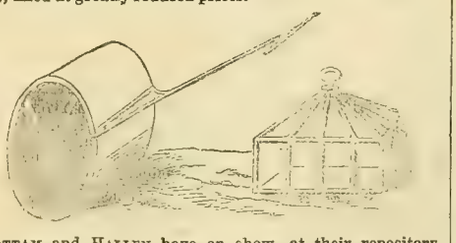
PATENT HOTHOUSE WORKS, KING'S-ROAD, CHELSEA.



E. DENCH having erected Two Patent Hothouses at the west end of the Great Exhibition, invites the attention of Gentlemen to the superior qualities, with the lowness of price, attending the erection of his Patent Houses; and having now ready for sale FIVE HOUSES of different sizes and descriptions on his premises, and some of them at a great reduction in the price, thinking of making alterations on his premises.

Hothouses built to be Glazed without Putty for Wood, and warranted not to drip under any circumstances.

Heating with Hot-water on the most scientific and economical principles.



BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking apparatus possesses greater general advantages than any yet submitted to the public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the apparatus. B. and H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. May be seen in daily use at the Craven Hotel, Craven-street, Strand; Stevens' Hotel, Bond-street; Greenwich Hospital; University College Hospital; and is in use by upwards of 200 private families, and at the Manufactory, 130, Fleet-street, London. A prospectus can be forwarded upon application, detailing particulars and price.

COTTAM & HALLEN, Engineers, Iron Founders, &c., No. 2, Winsley-street, Oxford-street, London.

Cottam and Hallen having had long experience in the erection of HOTHOUSES and CONSERVATORIES (made of Iron or of Iron and Wood combined), and from many improvements they have made during that time, can with confidence undertake to erect such buildings with economy and dispatch.

HOT WATER APPARATUS for heating the above and other buildings (of which they have constructed upwards of 3000), fixed at greatly reduced prices.

Cottam and Hallen have on show, at their repository, No. 2, Winsley-street, Oxford-street, a great variety of the following articles, for GARDENS, &c., at Greatly REDUCED PRICES, viz.:—

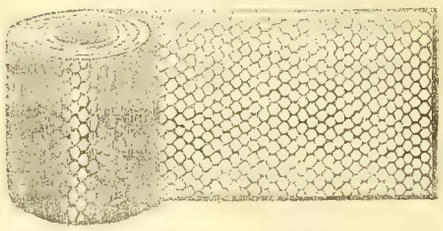
| | |
|---|---|
| Garden Rollers | Hand-glass Frames |
| Garden Engines | Flower Stakes |
| Garden Syringes | Flower-bordering |
| Watering Pots | Flower Stands |
| Garden Vases | Garden Arches |
| Mowing Machines | Garden Chairs |

Every description of Work, both Plain and Ornamental, in wrought and cast iron, for Gardens, &c., &c.

HORTICULTURAL TOOLS and AGRICULTURAL IMPLEMENTS of all kinds.

STRONG IRON HURDLES, strained Wire Fencing, &c.

Show Rooms at the MANUFACTORY, 2, Winsley-street, and 76, Oxford-street, three doors West of the Princess's Theatre.



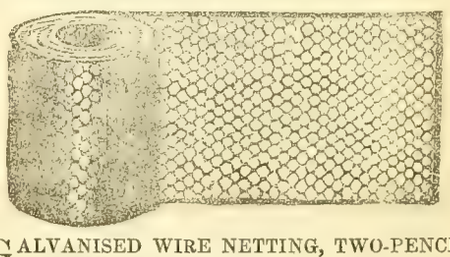
SMITHFIELD CLUB, 1851.

THE CHRISTMAS FAT CATTLE SHOW will take place on TUESDAY, 9th, WEDNESDAY, 10th, THURSDAY, 11th, and FRIDAY, 12th of December, 1851, at the CARRIAGE BAZAAR, King-street, Baker-street, Portman-square.

Lists of the Prizes offered, and every information may be obtained on application to

B. T. Brandreth Gibbs, Hon. Sec.
Corner of Half Moon-street, Piccadilly, London.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.



| | | Galvanised. | Japanned Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24-inch wide | ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch " strong " | ... | 9 " | 6½ " |
| 2-inch " extra strong " | ... | 12 " | 9 " |
| 1½-inch " light " | ... | 8 " | 6 " |
| 1½-inch " strong " | ... | 10 " | 8 " |
| 1½-inch " extra strong " | ... | 14 " | 11 " |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

| | | | |
|---|---|---|---|
| 12 inches wide | 3*d.* per yard. | 30 inches wide | 7½*d.* per yard. |
| 18 " " | 4½*d.* " | 36 " " | 9*d.* " |
| 14 " " | 6*d.* " | 48 " " | 1*s.* " |

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, ugly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each. Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of Thomas Henry Fox, 44, Skinner-street, Snow-hill, London.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL and Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained two Silver Medal Prizes, and is the Felt solely patronised and adopted by

Her Majesty's Woods and Forests,
Honourable Board of Ordnance,
Honourable East India Company,
Honourable Commissioners of Customs,
Her Majesty's Estate, Isle of Wight,
Royal Botanic Gardens, Regent's Park,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the Royal Agricultural Society's House, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

Price One Penny per Square Foot.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL and CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhhil-row, London, where Roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance of Westminster Hall, were roofed with F. M'Neill and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

Note.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

NATURAL HISTORY.
A PRACTICAL TREATISE ON THE CULTURE OF THE VINE. By JOHN SANDERS, Gardener to T. Assheton Smith, Esq. 8vo. Illustrated with Plates, 5s.
"Mr. Assheton Smith's place at Tedworth has long possessed a great English reputation for the excellence of its fruit and vegetables; one is continually hearing in society of the extraordinary abundance and perfection of its produce at seasons when common gardens are empty, and the great world seems to have arrived at the conclusion that kitchen gardening and forcing there are nowhere excelled. We have, therefore, examined, with no common interest, the work before us, for it will be strange indeed if a man who can act so skilfully as Mr. Sanders should be unable to offer advice of corresponding value. We have not been disappointed. Mr. Sanders's directions are as plain as words can make them, and, we will add, as judicious as his long experience had led us to expect. After a careful perusal of his little treatise, we find nothing to object to and much to praise."—*Gardeners' Chronicle.*

THE VICTORIA REGIA. By Sir WILLIAM J. HOOKER, F.R.S. Elephant folio. 31s. 6d. Illustrated with four beautifully coloured plates by Fitch, showing
1. The entire plant, flower, fruit, and leaves on the surface of the water.
2. A flower *of the natural size* in progress of expanding, together with as much of the enormous foliage as the broad dimensions of the paper will admit.
3. A fully expanded flower *of the natural size*, with foliage, &c.
4. A vertical section of the fully developed flower, with various dissections and analyses.

CURTIS'S BRITISH ENTOMOLOGY.—The "British Entomology" was originally brought out in Monthly Numbers, size royal 8vo, at 4s. 6d., each containing four coloured plates with text. It was commenced in 1824, and completed in 1840, in 193 Numbers, forming 16 volumes, price 43l. 16s.
The work is now offered new, and in the best condition:—Price to Subscribers for complete copies in 16 volumes, 21l. Price of the new issue, and of odd Numbers, 3s. 6d. per No.
*** Vols. I. and II. of the New Issue are now ready for delivery.
London: REEVE and BENHAM, 5, Henrietta-street, Covent Garden.

Lately published,

London: W. S. ORR and Co., Amen Corner, Paternoster-row.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.
S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.
Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

DURABLE OUT-DOOR PAINT.
Removed to No. 9, Great Winchester-street, Old Broad-street, Royal Exchange.
CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Wood, Iron, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.
Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON and SON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange, London.
No Agents.—All orders are particularly requested to be sent direct.

THE GREAT EXHIBITION.—HINTS TO VISITORS.—Among the tens of thousands who will grace the Industrial Fair, every nation will contribute bright samples of its youth, beauty, and fashion. The frequenters of the Ball, the Public Assembly, and the Promenade, will find both personal comfort and attraction promoted by the use of ROWLAND and SONS' valuable aids; and what better mark of esteem can be offered to friends on their return home, as a momento of the Great Exhibition, than a packet of
"ROWLANDS' UNIQUE DISCOVERIES."

ROWLANDS' MACASSAR OIL,
For the growth, and for preserving, improving, and beautifying the Human Hair.
ROWLANDS' KALYDOR,
For improving and beautifying the Skin and Complexion, eradicating all Cutaneous Eruptions, Sunburn, Freckles, and Discolorations, and for rendering the Skin soft, clear, and fair.
ROWLANDS' ODONTO,
Or PEARL DENTIFRICE, for preserving and beautifying the Teeth, strengthening the Gums, and for rendering the Breath sweet and pure. Price 2s 9d. per box.
BEWARE OF SPURIOUS IMITATIONS.
The only GENUINE of each bears the name of "ROWLANDS'," preceding that of the article on the Wrapper or Label.
Sold by A. ROWLAND and SONS, 20, Hatton-garden, London; and all Chemists and Perfumers.

EASTERN COUNTIES RAILWAY.—The Directors are prepared to receive Tenders for Loans, for periods of 3, 5, or 7 years. All applications to be addressed to the undersigned. In consequence of the recent alteration in the stamp laws, sums not less than 100l. will now be received by this Company,
By order, C. P. RONEY,
Bishopsgate Station, June 7. Secretary.

GRAND EXPOSITION OF ALL THAT IS GROWN IN THE GARDEN AND THE FIELD. Open to Growers of the United Kingdom.

The Last Week in AUGUST next, in the Grounds and Premises of TARVIN HALL, near Chester.

Fruits, Flowers, and Vegetables, Agricultural Roots, Artificial Grasses, Hops, Flax, and Corn in the Straw; Garden Tools, Ornamental Manufactures in Rustic Wood-work, Wire-work, and Stone, for Garden Decorations; Domestic and Ornamental Poultry; the Productions of Cottage Gardeners; with whatever is interesting and useful to the Gardener and the Agriculturist.

The whole will be classified, and duly arranged into sections, and completely catalogued, under the direction of T. C. Archer, Esq., who was appointed by the Committee to arrange the natural products into Liverpool for the Great Exhibition.

There will be a *Dejeuner* each day, when Papers and Essays will be read by eminent practical men in their several departments. Growers from nearly all parts of England and Ireland, and several from Scotland, will be contributors.

The most ample accommodation will be provided, and Tents and Stages erected for each description of produce.

Further particulars will be duly announced.

PRIZE ESSAYS.

For the best Essay on laying out and keeping in perfection throughout the year an Ornamental Garden from one acre upwards. The names, colours, and height of the Flowers and Flowering Shrubs arranged as they will bloom each month in the year; their mode of culture, and kind of soil suitable for each.—A Gold Medal, value Five Guineas.

For the best Essay on the management of the Vegetable and Fruit Gardens throughout the year; sorts to be grown, suitable soil and situation, time of sowing or planting, quantity of seed or plants to a given space, time of fruiting or coming to perfection in the Northern, Midland, and Southern Districts of England.—A Gold Medal, value Five Guineas.

For the best Essay on the laying out and management of a Cottage Allotment, from a quarter to half an acre in extent.—A Silver Medal, value Three Guineas.

For the best Essay on the management of a mixed Farm of 100 acres, on the relative economy of artificial and other manures, and spade and plough tillage.—A Gold Medal, of the value of Ten Guineas.

June 14.

THE CHILDWALL FLORAL AND HORTICULTURAL EXHIBITION, [open to all Competitors, will take place in a spacious Marquee, near the Abbey, Childwall, Liverpool, on THURSDAY, the 19th instant. Patrons: The Most Noble the Marquis of Salisbury; The Right Hon. Lord Stanley; Sir John Gerard, Bart.; John Ireland Blackburne, Esq., and His Worship the Mayor of Liverpool. Subscription 5*s*., entitling the Subscriber to 5*s*. Doors open to Subscribers until 3 o'clock, after which the charge to the Public will be 1*s*.

Tickets may be had of any Seedsman in Liverpool; Messrs. DAVIES, Wavertree; Mr. PEYTHIAN, Gateacre; the Abbey, Childwall; and Mr. T. C. ARCHER, Standard-office, Liverpool.

GARDENERS' BENEVOLENT INSTITUTION.—At a General Meeting of the Members of this Society, held on Wednesday, the 11th June, for the purpose of electing Two Pensioners on the Funds of this Charity, the following was the result of the Ballot:—

| Name. | Application. | Age. | Votes. |
|---|---|---|---|
| 1. EDWARD MARSHALL | 10th | 71 | 221 |
| 2. JOHN APPLEBY | 6th | 59 | 126 |
| 3. JAMES BATTEY | 5th | 68 | 306 |
| 4. JOHN COCKS | 5th | 65 | 390 |
| 5. WILLIAM BROWN | 4th | 73 | 8 |
| 6. RICE EVANS | 4th | 73 | 22 |
| 7. CORNELIUS ROBINSON | 4th | 74 | 109 |
| 8. JOHN SNOW | 4th | 68 | 229 |
| 9. THOMAS FITZGERALD | 3d | 70 | 332 |
| 10. JOHN HOPKINS | 3d | 65 | 20 |
| 11. HENRY SCHNEIDER | 3d | 86 | 133 |
| 12. WILLIAM CARTER | 2d | 71 | 5 |
| 13. JAMES GREEN | 2d | 61 | 197 |
| 14. WILLIAM JACKSON | 1st | 69 | 179 |
| 15. JOHN MEARNS | 1st | 72 | 232 |

The Meeting then declared John Cocks and Thomas Fitzgerald, as having the greatest number of votes, duly elected Pensioners. By Order. EDWARD R. CUTLER, Secretary.

97, Farringdon-street, June 14, 1851.

MITCHELL'S SUPERB SHOW OF RANUNCULUSES.

EDWARD MITCHELL, FLORIST, Bristol Gardens, Brighton, begs most respectfully to inform the Admirers of the RANUNCULUS that his unrivalled Beds, containing upwards of 70,000, is now on view every day except Sundays, and Tickets may be had, at 1*s*. each, of Messrs. Hurst and McMullen, Seedsmen, Leadenhall-street, London; and at E. MITCHELL'S, 55, Marine Parade, Brighton.

TO NURSERYMEN, FLORISTS, &c.

BETHAM AND BLACKITH, Custom-house, Insurance, and General Forwarding Agents, Cox and Hammond's Quays, Lower Thames-street, beg to return thanks to their Continental and Home friends for the numerous favours they have so long and largely enjoyed, and to assure them that they continue to receive and forward goods to all parts of the world at the *lowest possible* charges, consistently with responsibility, safety, and despatch.

"THE FLOWER OF THE DAY."—This elegant variegated GERANIUM may now be seen in bloom, under glass and bedded out, at J. and C. LEE'S Nursery, Hammersmith, near London.—June, 1851.

GLOXINIA "PETOIANA."—Messrs. YOUELL and Co. have the greatest satisfaction in offering the above magnificent Gloxinia, raised at the seat of Samuel Morton Peto, Esq., M.P., Somerleyton Hall, Suffolk, and is without exception the handsomest of the genus. The flowers are white, suffused with the most delicate tint of blush, the upper and lower parts of the throat being surrounded (as in Gloxinia Fyfiana) with the richest crimson Lake. The following opinion of it is given in the *Gardeners' Journal* of Sept. 14th, 1850: "Superb in substance; ground white, of crystal-like appearance, just tinged with an exquisite shade of blush; the lower portion of the throat is magnificent crimson lake, minutely speckled with the same towards the base of the bloom, which is of the most perfect consistency."

Good established plants will be sent out on and after the 26th of June at 15*s*. each, with the usual discount to the trade when three or more are taken.—Royal Nursery, Great Yarmouth

NOTICE.—EXHIBITION OF AMERICAN PLANTS, KNAP-HILL NURSERY, NEAR WOKING, SURREY.—The American Plants, at this Nursery, are now in bloom, and may be seen daily (gratis), Sundays excepted. The Knap-hill Nursery is within one hour's ride of London, being near the Woking Station, South-Western Railway, where nearly every train stops, and from whence conveyances may at all times be obtained.

HOSEA WATERER takes this opportunity of stating that the Exhibition of American Plants in the Horticultural Society's Garden, Chiswick, is entirely supplied from his Nursery, and that he is *not* this year a contributor to that in the Botanic Gardens, Regent's-park.—Knap-hill, Woking, Surrey, June 14.

THE AMERICAN NURSERY, BAGSHOT, SURREY.

JOHN WATERER begs to announce that his splendid Collection (containing many thousand specimens) of RHODODENDRONS, AZALEAS, &c., is now in full bloom, and may be seen daily, gratis, Sundays excepted.

The Nursery is situated three miles from the Blackwater Station, South-Eastern Railway, and near the Farnborough Station, South-Western Railway.—Conveyances are always to be obtained at either Station.

He also begs to state, that he is the principal contributor to the great American Plant Exhibition, now on view at the Botanic Gardens, Regent's Park.

THOMAS JACKSON AND SON'S PRICED CATALOGUE OF PLANTS is now ready, and may be obtained by prepaid application; it contains Orchidaceous, Stove, Greenhouse, and Herbaceous Plants; Roses, Shrubs, Ornamental Trees, &c. &c.

Nurseries, Kingston, Surrey, June 14.

GERANIUMS.

BASS AND BROWN have still a fine Stock of the following choice GERANIUMS, bushy plants, with abundance of buds, for immediate flowering: Magnificent, Flying Dutchman, Painter, and Prince of Orange, 3*s*. 6*d*. each.

Cassandra, Cavalier, Clara, Crusader, Distinctus, Elegans, Empo, Forget-me-not, Grandiflora, Gulielma, Jenny Lind, Queen of Scots, Painted Lady, Princess, Rachael Superb, Rebecca, Refulgent, Resplendent, Roll'a, Rosa Mundi, Scarlet Defiance, Star of the West, Sundown, Symmetry, and Windsor Castle. The above set of 25 for 30*s*., or any 12 for 18*s*.

Augusta, Brockii, Camilla, Desdemona, Duke of Cornwall, Duke of Hamilton, Gigantic, Isabella, Josephus, King, Lord Chancellor, Madeline, Marmion, Minna, Mogul, Mustee, Negress, Orion, Peri, Pluto, Pu'chellum, Rosy Circle, Sarah Jane, Sir Robert Peel, The Jew, and Zenobia. The set of 25 for 15*s*., or any 12 for 9*s*.

Also the following fancy varieties:—Anais, Black Prince, Beauty of Winchester, Clown, Dandy, Harlequin, Jehu Improved, Jenny Lind, La Belle d'Africana, Lady F. Hastings, Maid of Anjou, Mazeppa Superba, Princess Alice Maude, Princess Helena, Queen of Summer, Statiaski, and Yeatmannianum. The set for 15*s*., or any 12 for 12*s*.

BEDDING AND SELECT PLANTS. See a list of these in the *Gardeners' Chronicle* for May 31 and June 7.

Catalogues supplied free on application.

Seed and Horticultural Establishment, Sudbury, Suffolk.

FUCHSIA "CLAPTON HERO" (BATTEN). Ditto "PAGODA" (BATTEN).—These can with confidence be recommended as the best of the dark varieties of this season; price 7*s*. 6*d*. each.

POTENTILLA LUCIA; OR, BICOLOR GRANDIFLORA.—Colour, sulphur yellow, edged with scarlet; vigorous grower, and produces the largest flowers of any known variety; 5*s*. each.

POTENTILLA ANTWERPIENSIS.—Colour, dark brilliant orange, dwarf growth, producing semi-double flowers in great profusion, which do not close at night; 7*s*. 6*d*. each.

SWEET ORANGES, 18 inches to 2 feet, in Fruit; 10*s*. each.

Also all the new English and Continental Verbenas, Fuchsias, Liliputian Chrysanthemums, German Daisies, &c. For particulars of which we refer to our general Catalogue just published, which can be had by post, free, on application.

HUGH Low and Co., Clapton Nursery, London.

ROSE NURSERIES, HERTFORD.

E. P. FRANCIS offers the following Stock of Bedding-out Plants, strong and vigorous, in 60-size pots, and which will be sent to any part of the kingdom, carriage paid to London:

SCARLET GERANIUMS, Tom Thumbs, &c., 4*s*. per doz., strong.
VERBENAS, all the best varieties in cultivation, 3*s*. per doz.
SALVIAS, blue and red, 4*s*. per doz.
FUCHSIAS, all the best leading varieties, 4*s*. per doz.
HELIOTROPES, including the new varieties, 3*s*. per doz.
PENTSTEMONS, fine varieties, 4*s*. per doz.
AGERATUM CŒLESTINUM, 3*s*. per doz.
CALCEOLARIAS, Viscosissima and other varieties, 3*s*. per doz.
ANAGALLIS, blue and red, 4*s*. per doz.
NIEREMBERGIAS, 4*s*. per doz.
CUPHEA PLATYCENTRA, 3*s*. per doz.
GAILLARDIA PICTA, &c., 3*s*. per doz.—June 14.

JOHN DOBSON, late GARDENER to Mr. EDWARD BECK, Worton College, Isleworth, begs to acquaint the admirers and cultivators of PELARGONIUMS, that he has commenced business as a FLORIST and SEEDSMAN, at Woodlands, Isleworth; and by the aid of his late employer, who has supplied him with a large stock of his finest varieties, he is enabled at once to execute any orders with which he may be favoured, and which, until his Greenhouses are erected on his own ground, may be addressed to him at Worton Cottage, Isleworth, near London, where he has permission to show his Plants until he can remove them, as well as Mr. Beck's collection of Seedlings of the past and present year.

AZALEA INDICA "SYMMETRY."

J. AND C. LEE are now sending out this fine variety, well established plants, 21*s*. each, with the usual discount to the trade.

Nursery, Hammersmith, near London, June, 1851.

SELECTED CINERARIA SEED, saved from one of the choicest and finest varieties in cultivation, this being the proper time for sowing (which any amateur may cultivate with little trouble and sure success), to insure good strong plants that will bloom well the forthcoming season.

Packets of the above can be forwarded to any part, on receipt of 18 penny postage stamps.—EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath.

MESSRS J. AND H. BROWN offer the following desirable Plants:

| | | | |
|---|---|---|---|
| 12 | ORCHIDEA, choice species and good plants, for | 30*s*. | 0*d*. |

| | First-class DAHLIAS, show and fancy varieties, per dozen | 6 | 0 |

Verbenas, Petunias, Pentstemons, Salvias, Lobelias, Calceolarias, Cupheas, Œnotheras, Geraniums, Antirrhinums, Phloxes, Pansies, Lantanas, Climbers, &c., for planting out, 3*s*. 6*d*. to 5*s*. per dozen.

Catalogues of plants, &c., free by post.

Albion Nursery, Stoke Newington, London, June 14.

DALSTON NURSERY, MIDDLESEX.

WILLIAM HARRINGTON, successor to the late Mr. JOHN SMITH, begs to inform the Nobility, Gentry, and the Trade, that he has taken the above Premises, and hopes by attention and assiduity to be favoured with the same liberal patronage as his predecessor.—June 14.

RIVERS'S STUBBLE SWEDE TURNIP SEED.

J. RIVERS solicits the attention of Agriculturists to his quick-growing SWEDE TURNIP. The variety owes its origin to a cross between a large variety of the Early Stone, in 1842, and the old Green Top Swede. It has become a distinct variety, by carefully selecting, for seven years, those most like the Swede in habit, so that now it is a true Swede, with the earliness of the White Stone; it is green topped, with a short neck, with the solid yellow flesh of the common Swede; for sowing in May, for early feed, or for late sowing upon heavy land and sheep-fed leys, it will be found a valuable Turnip for hardiness and keeping qualities; also for sowing near large towns, to draw off early. It grew 11 tons per acre after Tares, mowed, without manure, on the 6th of August, 1849. Specimens of the roots were exhibited at the Baker-street Cattle Show; also Specimen Roots of different times of sowing, from May till August, were exhibited. Orders for any quantity above 10 lbs. will promptly be attended to, if addressed to JOHN RIVERS, Seedsman, Sawbridgeworth, Herts, at 2*s*. per lb., carriage paid to London. It will be sold in sealed bags, of 2½ lbs., price 5*s*., and 5 lbs. 10*s*., by the following agents:—Aberdeen, Union-street, Mr. J. Roy; Ayr, N. B., Messrs. Imrie and Sons; Belfast, Messrs. Farrell and Co.; Bristol, Messrs. Garaway, Mayes, and Co.; Carlisle, Messrs. Little and Ballantyne; Chester, Messrs. F. and J. Dickson; Chilwell, Nottingham, Messrs. J. R. and A. Pearson; Cirencester, Mr. R. F. Darby; Chichester, Mr. H. Silverlock; Clonmel, Ireland, Messrs. Higgins and Sons; Dunse, N. B., Messrs. Hogg and Wood; Dundee, Messrs. Urquhart and Sons; Edinburgh, Leith-walk, Messrs. Dickson and Co.; Exeter, Messrs. Veitch and Son; Folkestone, Mr. James Mickle; Glasgow, Messrs. Austin and M'Aslan; Inverness, Messrs. Howden (Brothers); Hull, Messrs. Dickson; Maresfield, Uckfield, Sussex, Messrs. Wood and Son; Malton, Yorkshire, Mr. John Sloter; Norwich, Exchange-street, Mr. Ewing; Plymouth, Mr. A. Pontey; Perth, Messrs. Dickson and Turnbull; Peterborough, Mr. Plutter; Reading, Messrs. Sutton and Sons; Sudbury, Suffolk, Messrs. Bass and Sons; Sheffield, Messrs. Fisher and Holmes; Westerham, Mr. J. Cattell; York, Messrs. Backhouse and Sons.

PLANTS OF CABBAGE, SAVOY, KALE, BROCCOLI, CAULIFLOWER, AND CELERY.

JOHN CATTELL, NURSERYMAN AND SEEDSMAN, Westerham, Kent, begs respectfully to inform the public that Plants of his superior true sorts of the above are now ready, and will be forwarded, as usual, to order, on receipt of postage stamps or Post-office order, made payable here, at the under-named prices, basket or mat, and package included.

All the sorts of Early Cabbage, Savoy and Kale, including Brussels Sprouts, 4*s*. 6*d*. per 1000; all the sorts of Autumn and Spring Broccoli, 5*s*. 6*d*. per 1000; all the sorts of Celery, 5*s*. 6*d*. per 1000; Cauliflower, Early and Late, and Red Cabbage, 9*d*. per 100; Drumhead, or Cattle Cabbage, 3*s*. 6*d*. per 1000. 6*d*. per 1000 less, when no mat or package is required. Packages of 1000 and upwards delivered free of carriage to the Edenbridge Station of the South-Eastern Railway.

Seed of CATTELL'S Dwarf Barnes, and of his superior Dwarf Reliance Cabbage, may be had in packets, by post, for 12 penny stamps per packet, the former containing 1 oz. as usual, and the latter ½ oz.

# HORTICULTURAL SOCIETY OF LONDON.

EXHIBITION AT THE GARDEN, JUNE 7, 1851.

12 To the same, for a shrubby species of Calceolaria from Peru
13 To Mr. Floud, Gardener to C. Bailey, Esq., Aberaman House, near Aberdare, Glamorganshire, for a Queen Pine-apple, weighing 5 lbs. 14 oz.
14 To Mr. Davis, of Oak Hill, East Barnet, for a Providence Pine-apple, weighing 6 lbs. 11 oz.
15 To Mr. Slowe, Gardener to W. R. Baker, Esq., F.H.S., for Black Hamburgh Grapes
16 To Mr. Davis, of Oak Hill, for the same
17 To Mr. Smith, Gardener to S. Ricardo, Esq., Titness Park, Sunning Hill, for Sweetwater Grapes
18 To Mr. Turnbull, Gardener to the Duke of Marlborough, at Blenheim, for Muscat Grapes
19 To Mr. Harrison, Oatlands Gardens, Weybridge, for the same
20 To Mr. Bain, Gardener to B. Bernasconi, Esq., of Harrow-Weald, for White Frontignan Grapes

### THE SILVER KNIGHTIAN MEDAL.

1 To Mr. Stuart, Gardener to T. Huggins, Esq., of Norwood, for six Stove and Greenhouse Plants
2 To Mr. Cole, Gardener to H. Colyer, Esq., of Dartford, for a single specimen of Exotic Orchid (Dendrobium Calceolaria)
3 To Mr. Watson, Gardener to Mrs. Tredwell, Lower Norwood, for a collection of Helichrysums
4 To Mr. Smith, Gardener to W. Quilter, Esq., of Norwood, for 6 varieties of Cape Heath in 8-inch pots
5 To Mr. Willmer, of Sunbury, for a collection of Pinks
6 To Mr. E. G. Henderson, of Wellington-road Nursery, for 6 varieties of Fancy Pelargonium in 8-inch pots
7 To Mr. Francis, of Hertford, for Pansies in pots
8 To Mr. Wood, of Norwood, for Alpine Plants
9 To Mr. Kinghorn, Gardener to the Earl of Kilmorey, F.H.S., for a single specimen of Erica Cavendishii
10 To Mr. Cole, Gardener to H. Colyer, Esq., of Dartford, for the same
11 To Mr. Wood, of Norwood, for Variegated Plants
12 To Messrs. Veitch, for Dendrobium Veitchianum
13 To Mr. Braid, Gardener to H. Perkins, Esq., of Hanworth-park, near Hounslow, for fruit of Musa Cavendishii
14 To Mr. Hoare, Gardener to J. Bailey, Esq., Glanusk-park, Brecknock, for a Queen Pine Apple, weighing 4 lbs. 12 oz.
15 To Mr. Slowe, Gardener to R. W. Baker, Esq., F.H.S., for a Providence Pine Apple
16 To Mr. Ingram, Gardener to Her Majesty at Frogmore, for Black Hamburgh Grapes
17 To the same, for Muscat Grapes
18 To Mr. Mitchell, of Brighton, for Black Hamburgh Grapes
19 To Mr. Rust, Gardener to J. Maclaren, Esq., F.H.S., for Muscadine Grapes
20 To Mr. Cox, Gardener to J. Tredwell, Esq., Leigham-court, Brixton-hill, for White Frontignan Grapes
21 To Mr. Collinson, Gardener to the Marquis of Westminster, Eaton-hall, Cheshire, for Royal George Peaches
22 To Mr. Davis, of Oak-hill, for Noblesse Peaches
23 To Mr. Elliott, Gardener to Mrs. Boothby, of Twyford-abbey, Acton, for a collection of Strawberries in pots
24 To Mr. Ewing, Gardener to O. F. Meyrick, Esq., F.H.S., for a Green-fleshed Melon

### THE SILVER BANKSIAN MEDAL.

1 To Mr. Williams, Gardener to C. B. Warner, Esq., F.H.S., for 6 Stove and Greenhouse Plants
2 To Mr. Taylor, Gardener to J. Coster, Esq., for a collection of Helichrysums
3 To Mr. Francis, of Hertford, for Yellow Roses
4 To Mr. Bragg, of Slough, for Pansies, in pots
5 To Mr. Turner, of Barnes Common, for Alpine plants
6 To Mr. May, Gardener to Mrs. Lawrence, F.H.S., for a single specimen of Leschenaultia biloba major
7 To Mr. Speed, of Edmonton, for Clerodendron fallax
8 To Mr. Cole, Gardener to H. Colyer, Esq., of Dartford, for a single specimen of Pimelea Hendersoni
9 To Mr. Coster, of Benson, for Ranunculuses
10 To Mr. Speed, for Clerodendron Bethuneanum
11 To Mr. Frost, Gardener to E. L. Betts, Esq., of Preston-hall, near Maidstone, for a Queen Pine Apple, weighing 3 lbs. 4 oz.
12 To Mr. Harrison, of Oatlands, for a Queen Pine Apple
13 To Mr. Drummond, Gardener to C. H. Leigh, Esq., of Pontypool-park, for a Providence Pine Apple
14 To Mr. Boyd, Gardener to Viscount Dillon, of Dytchley, Eustone, for Black Hamburgh Grapes
15 To Mr. Harrison, of Oatlands, for the same
16 To Mr. Challis, Gardener to Mrs. Irvine, of Luddington-house, Egham, for Muscadine Grapes
17 To Mr. Cox, Gardener to J. Tredwell, Esq., of Leigham-court, for Muscat Grapes
18 To the same, for white Frontignan Grapes
19 To Mr. Slowe, Gardener to W. R. Baker, Esq., F.H.S., for Peaches
20 To Mr. Ingram, Gardener to Her Majesty at Frogmore, for British Queen Strawberries
21 To Mr. Mann, of Isleworth, for the same
22 To Mr. Turnbull, Gardener to the Duke of Marlborough, for Keens' Seedling Strawberries
23 To Mr. Mann, of Isleworth, for the same
24 To Mr. Robertson, Gardener to Lady Foley, Stoke Edith-park, Ledbury, for a Persian Hybrid Melon

### THE CERTIFICATE OF MERIT.

1 To Mr. Bragg, of Slough, for six Fancy Pelargoniums, in 8-inch pots
2 To Mr. Kinghorn, for Leschenaultia formosa
3 To Mr. Salter, of Hammersmith, for a collection of Daisies
4 To Messrs. Veitch, for Eurybia sp., from New Zealand
5 To Messrs. Henderson, of Pine Apple-place, for Gastrolobium cuneatum
6 To Mr. Elliott, Gardener to Mrs. Boothby, of Twyford Abbey, for British Queen Strawberries
7 To Mr. Harrison, of Oatlands Palace Gardens, for Keens' Seedling Strawberries
8 To Mr. Smith, Gardener to S. Ricardo, Esq., of Titness Park, for a Bromham Hall Melon

CHOICE CINERARIA SEED.

LUCOMBE, PINCE, AND Co., have saved from a Select Collection of all the Newest and Finest Varieties of 1851, which they have this season grown in great perfection, some Cineraria Seed, of excellent quality; and they beg leave to offer it for sale, in Packets, sealed and warranted by them, at 2s. 6d. each, free by post. If sown soon, strong plants will be produced, which will flower in 1852.

Exeter Nursery, June 14th.

FERNS AND ORCHIDS.

WILLIAM MASTERS has a Stove 40 feet square, filled with a rare collection of FERNS, some adapted for Wardian cases, and others for ornamenting Tanks, &c.

Also, a large collection of Orchids, some growing in pots, others on blocks, and in rustic baskets. Where the selection is left to W. M., they can be can be supplied good and cheap.

Orders are respectfully solicited.

Exotic Nursery, Canterbury.

PINE PLANTS.—THIRTY FRUITING PINE PLANTS (chiefly Lemon Queens), and 50 Succession PINE PLANTS, to be sold cheap.—Apply to E. P. DIXON, Nurseryman, Hull.

PRIMULA SINENSIS SEED.—Any person having the above in variety (warranted to be saved from first-rate flowers) to dispose of, can apply, stating price, &c., to Messrs. J. WEEKS and Co., King's-road Nursery, Chelsea, London.

ROSES.

"SANGSTER'S FLORUMBRA," for the protection of choice Roses, when in bloom, from sun or rain, as well as for destroying the Green Fly, with the assistance of Brown's Fumigator, may be had wholesale of Messrs. BARBER and GROOM, London; and retail of most Seedsmen and Ironmongers in the Kingdom; and of W. and J. SANGSTER, at their Manufactory, 75, Cheapside. Price, as Shades only, from 4s. each, or complete, from 7s. 6d. according to size. List of prices sent on application.

IPOMŒA LIMBATA (LINDLEY).

(A New and Beautiful Hardy Climbing Annual.)

MESSRS. WM. ROLLISSON AND SONS have the pleasure to inform the Nobility, Gentry, and Public in general, that they intend sending out, on and after the 24th of June, their new and beautiful IPOMŒA (named by Dr. LINDLEY Ipomœa limbata), 10s. 6d per plant, just coming into flower; the usual discount to the trade.

N.B. Fine plants of the true RHODODENDRON JAVANICUM, from 7s 6d. to 10s. 6d. and 21s., according to the size of the plant.—Tooting, Surrey.

FERNS.—The present prevailing taste for this interesting and elegant tribe of plants, has induced the Subscribers to offer them in selections as under:—12 distinct exotic species, 30s. to 60s.; 25 ditto, 50s. to 100s.; 20 distinct hardy species, 1s. to 1s. 6d. each. Selection of sorts left to H L. and Co. It would be advisable to state if they are required for Wardian cases, as small growing sorts would then be selected.—HUGH LOW and Co., Clapton Nursery, London.

CATTLE DRUMHEADS (fine), warranted true, by THOMAS WELLAND, Surrey Gardens, near Godalming, Surrey.—Delivered at Godalming Station, 3s. 6d. per 1000, crates included. Cauliflowers 2s. 6d. per 100.

JOHN HAYES, FLORIST, Farnham, Surrey, begs to state that he has a quantity of BEDDING PLANTS left, which he will send by post, at 1s. per dozen; GERANIUMS, 1s. 6d. per dozen.—Catalogues sent on the receipt of one postage stamp.

TO CAMELLIA GROWERS.

TO BE DISPOSED OF, a very fine well-grown Bushy Plant of the MARCHIONESS OF EXETER, measuring between eight and nine feet from the surface of the pot. Upwards of 100 blooms expanded themselves last season. Price 10l. 10s.; valued at 25l. by the trade. A certificate will be given by the grower, who is also the possessor of the original plant.—Letters, post paid, to be addressed to W. BROCK, Esq., Manor House, Guernsey.

MESSRS. VEITCH AND SON beg to call attention to the three following rare and beautiful Plants, for description of which see Advertisements in *Gardeners' Chronicle* of last Saturday, viz.—

| | £ | s. | d. |
|---|---|---|---|
| CANTUA DEPENDENS ... ... | 1 | 1 | 0 |
| BERBERIS DARWINII ... ... | 1 | 1 | 0 |
| MEDINILLA MAGNIFICA ... ... | 3 | 3 | 0 |

Good established plants now ready for sending out at the above prices. The usual discount to the Trade.

*** The Cantua is the plant that has attracted such general admiration at the recent Exhibitions at Chiswick and the Regent's-park, and has received Three First Class Medals as a New Plant.—Exeter, June 14.

FOR PRESENT SOWING, all Post free.—Mignonette, or Nemophilas, for successional sowings, 8d. per oz.; 12 packets of Annuals, for autumn flowering, 1s.; 12 packets of Biennials, 1s.; first-rate Hollyhocks, Cinerarias, Scarlet Giant Stocks, Sweet-williams, Pentstemons, Heartsease, Scabias, and Heracleum giganteum, each, 6d. per packet. Superior Summer Lettuce, and other Vegetable Seeds, 4d. per packet; or 8d. per oz.

Plants of the Heracleum giganteum 9d. each, or six do. for 3s. This plant, with us, is already 10 feet high, with leaves 6 feet long and 6 feet broad.

Remittances requested, which may be made by stamps, in exchange.—ABRAHAM HARDY and SON, Seed-growers, Maldon, Essex.

NEW HARDY JAPAN PLANT.

DEUTZIA GRACILIS (TRUE.)

JOSEPH BAUMANN, NURSERYMAN, Ghent, Belgium, having a good stock of the above beautiful and distinct DEUTZIA, will send it out on the 1st of August.

| | £ | s. | d. |
|---|---|---|---|
| Extra strong well established plants ... ... | 1 | 0 | 0 |
| Smaller do. do. ... ... ... | 0 | 12 | 6 |
| Grafted, 4 to 5 feet high ... ... ... ... | 2 | 0 | 0 |

J. B.'s Deutzia gracilis will never grow higher than 2 feet. Messrs. Hugh Low and Co., of Clapton, have seen it in bloom, and have ordered 40 plants of it.

This plant may be had in bloom six months in the year.

J. B. has received the following prizes for this plant. 1850, Ghent first prize; 1851, Chiswick, May the 3d, prize of excellence; Regent's Park, May 14th, first prize. Bruxelles first prize, Antwerp first prize, Mechlin first prize, Louvain first prize, Mentz first prize, Erfurt first prize, Paris first prize.

One over to the Trade on three. No discount if less than three plants are ordered. Free to London.

Deutzia crenata vera, new (D. gracilis of some), 1s.

NEW DAHLIAS; E. FOSTER'S, Esq., CHOICE PELARGONIUMS; PICOTEES, CARNATIONS, HOLLYHOCKS, PANSIES, &c.

WILLIAM BRAGG, Star Nursery, Slough, begs to say his Catalogue of the above Flowers is now ready, and can be had on application. His choice SEEDLING DAHLIAS will be sent out the first week in May at 10s. 6d. each, viz.:—

ADMIRAL, rich lilac, very constant, gained first Seedling prize, 25s., at the Royal South London Exhibition; 21s. Shacklewell Open Shows, &c., fourteen first class certificates; the most successful flower of the year.

CARMINA, rich carmine, constant show flower, gained six first class certificates, &c., shown in several winning stands.

The Hon. Mrs. ASHLEY, waxy white, tipped with rose, splendid show flower, &c. W. B. thinks it the best Dahlia of the season; was awarded by Dr. LINDLEY a certificate of merit at the Horticultural Society, &c. Gained five first class certificates.

QUEEN OF FAIRIES, Domeyer. W. BRAGG has purchased the stock of this fine and constant fancy Dahlia, from the above amateur, who will give 5l. in prizes the next season for this flower. It gained a Seedling prize and first class certificate, with Edwards's Mrs. HANSARD; at the Royal South London Open Show Exhibition five first class certificates.

W. B.'s stock of Picotees, Carnations, and Pinks are strong and good; the best Hollyhock Seed ever sent out can be had in 2s. 6d. and 5s. packets, post paid, for prepayment.

HORTICULTURAL SOCIETY, 21, REGENT STREET.
NOTICE IS HEREBY GIVEN,
THAT
MR. HOSEA WATERER'S
**EXHIBITION OF AMERICAN PLANTS,**
IN THE GARDEN OF THIS SOCIETY, AT
TURNHAM GREEN,
*Is now open Daily, from* 9 A.M. *to* 6 P.M.

Fellows of the Society are admitted *free*. Tickets for other persons, available for every day except Sundays and the 6th and 7th of June, can be procured in the Society's Garden, price One Shilling each.

The purchase of such a ticket admits the bearer to the Garden without the order of a Fellow of the Society

TURNIP SEEDS OF FINE SELECTED STOCKS.

COUNTRY SHOWS.—Tuesday, June 17: Stamford Hill Horticultural, and Guildford Horticultural.—Wednesday, June 18: Scottish Pansy, and Brechin Horticultural.—Thursday, June 19: Bath Horticultural—Friday, June 20: Beccles Horticultural, and Newberry Horticultural.—Saturday, June 21: Staines Horticultural.

THE event of the past week has been the second show of the HORTICULTURAL SOCIETY at Chiswick. A sunless but dry day brought together 9383 visitors, forming such an assemblage of rank and fashion as is to be seen in these Gardens only, in the open air, near London. At an early hour the Exhibition had the distinguished honour of being inspected by her Royal Highness the Duchess of ORLEANS.

In speaking of the objects presented for examination, we can do little more than repeat what we have said on recent occasions, namely, that the great and important feature of the Exhibition was the total absence of ill-cultivated specimens. There were various degrees of excellence, but everything was excellent in its way. We may even add that the worst plants exhibited last Saturday would have swept away the first prizes 20 years ago. The miserable penny-pressed Pansy flowers, which once collected a crowd of simple admirers, would now be considered a disgrace to the place, and are satisfactorily represented by well cultivated specimens in pots. The gawky straggling half-starved sticks, first exhibited as Roses grown in pots, are replaced by plants of exquisite beauty prepared with unrivalled skill. And let us add, in justice to one class of exhibitors, even the Cape Heaths, which were for so many years produced in silly imitation of beehives, or Hottentot kraals, have at last been permitted to assume their natural forms. The pruning-knife, in moderation, has taken the place of the shears with which some innocent gardeners thought it necessary to clip their bushes into shape (!), and the genus Erica now merits, for its beauty, the high place in these exhibitions which was once given it merely because of the difficulty attending its cultivation.

As to Orchids, the fondness for them is evidently extending; new and good exhibitors are threatening the ancient lords of the region of epiphytes; and we have no doubt that in a few years the sanguine expectations of our friend "Dodman" will be realised, through the instrumentality of Mr. WILLIAMS's capital practical papers, now appearing weekly in our columns. The continual sales by auction of these plants afford opportunities of purchase suitable to the means of different classes of buyers, and it is not extravagant to predict that Orchids will some day be as common as Heaths and Pelargoniums. It is not impossible indeed that they may dislodge the latter, admiration of whose tawdry charms is more and more clearly on the decline.

As usual Messrs. VEITCH, of Exeter, stood pre-eminent among the exhibitors of new or rare plants. Their exhibition of Pitcher plants was one of the most remarkable sights that have yet been chronicled in the annals of Horticulture. Some, the Nepenthes, from the forests of the Indian Ocean, threw abroad their tendrils, and suspended their curious bags of green and crimson and white by whatever they could cling to. Others, the Sarracenias, from the swamps of North America, stood erect, like living trumpets, or imitating ewers and jugs of green and crimson; even while the spectator was looking at them, the unhappy fly might be seen entrapped amongst the relentless teeth with which the recesses of these cups are guarded. The most curious of all, perhaps, and the most beautiful in form, was the Cephalote, from the Australian bogs, whose delicate goblets reared their richly-carved and many-tinted crests above their bed of moss. No one in the world except Mr. VEITCH could produce such an exhibition as this. He had also a new yellow shrubby Calceolaria, with leaves like a Peach-tree; a curious Aster-like plant from New Zealand, said to be a hardy evergreen shrub; and the Eucalyptus coccifera of Van Diemen's Land, a tree with glaucous leaves and an abundance of large white flowers, which has lived without injury for several years at Exeter in the open ground, where it is now 20 feet high.

New hybrid plants are slow in appearing. The only one which caught our eye was a hybrid Pelargonium obtained between the lemon-scented (*Citriodorum*) and one of the Fancies, by Mr. THOMAS KEMPSTER, of Blackheath. His object was to add good flowers to sweet foliage, and we are glad to see that he is evidently on the road to success; the specimen exhibited was very pretty, and was accompanied by a cross between Radula and Rollisson's Unique, which we also look upon as a good beginning. If growers would but persevere in this way they would soon strike a rich vein, and occupy themselves more profitably in every sense, than in trying for results which only end in running out their breed. What is wanted among Pelargoniums is new blood, of which the wild species can furnish an abundance.

Among miscellaneous objects, was a remarkable collection from Syon, consisting of a tree bearing ripe nutmegs; a branch of Vanilla with flowers, and ripe as well as unripe pods; a Gamboge-tree, with rich orange fruit; and a piece of the Serpent Trichosanth (*Trichosanthes colubrina*), loaded with its long striped and twisted Cucumbers.

Of Mr. HOSEA WATERER's magnificent display of American plants in the Society's Garden, we spoke at length last week. On this occasion it was open to all visitors, throngs of whom were gratified by one of the most varied and beautiful spectacles which the gorgeous varieties of Rhododendron and Azalea can produce. Under the influence of the beauty of so grand a scene the clumsiness of the awning which screened it from the weather was hardly remarked. A few hours however after the close of the meeting this awning gave way before a gale of wind, and it became necessary to close the ground for some days, till it could be repaired. This has naturally given rise to expressions of surprise, and to inquiries, which we take this opportunity of answering, by stating that the awning in question (not furnished by Mr. EDGINGTON) was contracted for by the gentleman lately removed from his office of Secretary by the Fellows of the Horticultural Society, at their anniversary meeting; and that the contract was made, not only without the concurrence of the proper officer, but in opposition to all experience and remonstrance.

AMONGST the host of books, pamphlets, and newspaper letters, which have recently appeared on the SUPPLY OF WATER TO LONDON, there are two more especially deserving of notice, the one by the Hon. W. NAPIER, the other by Mr. PRESTWICH. The former is entitled "Suggestions for the Supply of the Metropolis from the Soft Water Springs of the Surrey Sands;" it is addressed to the Board of Health, and by them presented to both Houses of Parliament; it may, consequently, be considered as a fifth appendix to the report of last year, upon which we have already made a few remarks. We shall, therefore, now draw our readers' attention to one or two of the subjects treated of by Mr. NAPIER, whose main object, in the first instance, appears to have been the examination of the gathering grounds, as they are called, a district of about 150 square miles, south of London, and from the drainage of which it has been proposed to draw the requisite supply of water for the use of the metropolis. The simple fact, as stated by Mr. NAPIER, divested of all arguments, is, that a sufficient, nay, abundant supply of pure water may be easily obtained from the district in question; and he further observes, that it would obviously be better to collect the water immediately as it issues from the various springs, than to allow it first to become contaminated by contact with various soils. This is so far satisfactory; but we should like it still better if he did not go on to expatiate upon the "great and scarcely estimable benefits," which would in consequence accrue, not merely to the soil, but also to the inhabitants of the district itself. As for the calculation, that there is fifteen hundred and twenty-nine tons of water on every acre of the ground, which impedes cultivation, we must say, that although the statement may be curious it is one of very little value. If it be intended so completely to drain the soil of all moisture, as altogether to prevent any further evaporation from its surface taking place, then it is pretty certain that fertility, instead of being increased, will, on the contrary, be very seriously diminished. We greatly doubt the advantages which will arise from such a general and complete drainage as shall thoroughly remove from the "whole country the stigma of unnecessary and dangerous damp." Such statements as these are evidently intended to catch the million—they do not in any way strengthen the value of the facts themselves—on the contrary, they rather tend to give rise to doubts and questionings. For example, a good deal is said respecting the cool "grateful temperature" of the water, which is stated to have an average temperature of about 50°: then we are told, that by improved drainage the temperature of the soil is to be raised, and evaporation is to be prevented. Why it is this very evaporation, and the low temperature of the soil, that causes the spring water to be cool and grateful; and it is obvious that when the natural conditions of the soil are altered, all the properties of the water collected from it, and especially its temperature, will likewise be modified. The author appears a little uncertain as to the action of heat upon water, for he says a tumbler of water cannot be exposed for half an hour to the air without its becoming warm. Water will soon become warm, even though hermetically enclosed in glass, if it is placed in a warm situation; and, on the other hand, it will never become warm by mere exposure to the air when the temperature of the latter is near the freezing point. Mere exposure to air cannot make water warm, but the influence of heat will soon warm it, even though carefully protected from the air.

A rather important fact may be deduced from some of the statements contained in this part of Mr. NAPIER's essay, though it is not one which he endeavours to make out; he shows that the quantity of water given off by the various springs on the sides of a hill at Farnham is much greater than the whole quantity of rain-water which falls on the surface of the hill itself: from this he naturally concludes that it must in part be derived from the drainage of other and more distant parts of the country. It is perfectly plain then, that if in any way the outlet for these springs is increased, and especially if any perfect mode of drainage is applied to this hill, not only will the hill itself be affected, and the proportion of spring and surface waters materially altered, but also at the same time the outflow of water from these more distant places likewise will be proportionably affected. It is necessary to bear this fact in mind in considering the general relations of the subject, for it is evident that new considerations will arise, if, besides draining the gathering grounds, as they are called, the surrounding country also, to an indefinite extent, is likewise to be drained; and it is to this point that we would particularly draw the attention of the gardeners and farmers resident in the districts in question.

Mr. NAPIER has taken some pains to prove that soft water is very greatly superior to hard water for all domestic purposes; and he is evidently displeased that Messrs. BRANDE and TAYLOR confess that they could not find any very great difference between river water and distilled water in the preparation of tea. In the same way he is eager to show that the best beer is always made with soft water, and he asserts that all practical men are well aware of this. We must, however, confess that his arguments have failed to convince us, not merely on scientific, but on mere practical grounds. We have often heard excellent brewers state that the superiority of their beer in great part depended on the gypsum present in the water which they used. We believe it is an acknowledged fact that the water at Burton is a decidedly hard water, and contains a tolerably large proportion of lime. The remarks of Lord BACON upon this subject do not possess any very great value, and we cannot help thinking they had better have been omitted.

However people may differ as to individual facts, there is no doubt about one thing, that pure water is better for most purposes than that which is impure; and we cannot but admire the assertion that the Surrey waters are too pure, because, in consequence of their purity, they will cause the corrosion of leaden pipes. We own our inability to see that this is a reason for not using pure water, though it would be a good reason for discontinuing the employment of leaden pipes, which, if they are really unfit for the conduction of pure water, should be got rid of, and the sooner the better.

Possibly ere long new light will be thrown upon the whole of this important and complicated subject; some points will certainly be decided by careful experiments—such as the action of water upon lead; but there are other questions, such as the amount of

water to be collected from a given surface of land, and the effect which the drainage of that water from the land will produce, which are not so easily settled, and which very seriously concern the owners and occupiers of land near the proposed gathering grounds. For ourselves, we doubt whether the deep springs would long continue to yield their present supply, if the main source whence the water is derived were once tapped. On first sinking into the bed or stratum charged with water, it would of course discharge a very large quantity; but it appears to us highly probable that the supply would soon begin to fall off, in the same manner as has often already been noticed when a deep well has been much used.

## FLEMING'S WEED DESTROYER.

I NOTICE in last week's Paper a letter signed "H. Bailey, Nuneham," and it may seem presumption in any party to comment upon a paper written by one so well versed not only in the polite diction of our mother tongue, but also having a glib supply of that of our predecessors in the field of literature. Still common justice demands that when one sees another unjustly attacked, the former should, in doing as he would be done by, stand forward boldly in defence of the right.

Some parties may insinuate that I am a friend of the person attacked, and therefore likely to be impressed with a partial bias in his favour; but I shall leave every rightly constituted mind to judge for himself whether I say more than facts warrant and the case demands, and I should not have taken upon myself to reply to the letter in question had I not been afraid that Mr. Fleming, from the very friendly manner in which I have always heard him speak of Mr. Bailey, would treat him with more leniency than he has a right to expect; and I write this, therefore, with a desire, as a third party, to make known the truth, as I have had most excellent opportunities of making myself fully acquainted with it, having lived as foreman under Mr. Fleming about three years, ending about Midsummer 1850, and in that capacity I was much interested in every improvement introduced during the time at Trentham Gardens, and therefore I trust that the readers of the *Chronicle* will accept my evidence as worthy of attention.

When your leading article appeared on May 3d I read it with considerable interest, and was much pleased with the clear manner in which the merits and working of the machine were stated, feeling satisfied that nothing was exaggerated. But when I saw Mr. Bailey's letter, I was struck with the wanton perversion of plain facts which it exhibited; and especially as it distinctly shows that he has written without the slightest practical experience as to the utility of the invention. To the eyes of men gifted with clearness of vision, his letter is calculated to impress them with the belief that he has been actuated by an envious, if not a malicious disposition either towards the poor machine itself or its inventor, instead of with the "perfect good feeling" which he professes to hold in view; and, with regard to the "holy principle of truth," I will give him back his proverb, and, for the convenience of general English readers, an anglicised version—"Truth is truly noble, and in the end it will prevail."

Mr. B. should have given his arithmetical calculations, if he would have convinced us of the accuracy of his assertions when he first declares the non-existence of a saving, and afterwards roundly abuses Mr. F. and his noble employers for making or sanctioning such a saving. And I cannot help fancying that, if Mr. B. were in want of a situation to-morrow, he would find that the profound contempt which he expresses for judicious economy would not insure him a very favourable reception from those he would desire to serve.

Those who are acquainted with Mr. Fleming, and I believe their name is "legion," are in general aware that his principles are too liberal and enlightened to desire to introduce improvements with a view to throw any portion of the labouring population out of employment; and with those I feel sure that the attempt to injure him in public opinion will prove utterly abortive, and will consequently recoil upon the hurler of the envenomed shaft. But as many of the readers of your Paper do not happen to enjoy the same advantage, I am anxious for their sake, and to prevent their being misled, to explain to them that, in all the horticultural improvements which he has introduced to the notice of the public, his object has been the same as it would be of every good reformer, viz., to enable gardeners to give and employers to derive more satisfaction from the expenditure of a certain sum than they could by a pertinacious adherence to the ways of our forefathers. Let me ask Mr. Bailey if the latter course of procedure is "in accordance with the age, or at all worthy of the enlightened and high-minded spirit in which the Exhibition of 1851 has been carried out." And I must not leave this part of the subject without pointing out the positive humanity of adopting such improvements as these. Is there any gardening operation more injurious to the human frame than hand-weeding? Fancy a man on his hands and knees, huddled up in a heap, his breast exposed to the damp exhalations of the earth, from morning to night, day after day, week after week, year after year!

I could adduce instances of healthy men who have been crippled, and their constitutions broken, by the injurious effects of this employment; and of lads stunted and dwarfed by the same cause. Is it just, then, that a man who introduces an invention that will take these poor creatures off their knees, and place them upon their legs, should be branded with abuse? should he not rather receive public thanks as one of the benefactors of the age, who can thus ensure more pleasure to the employer and more comfort to the employed?

As Mr. F.'s conduct and motives have been so much misrepresented, it is but fair to call public attention to his disinterestedness. How many men in a thousand would have invented such a machine and given the entire benefit of it to the public without reserving any emolument to himself by patenting, registration, or any other means? Nay, more, he has, to my certain knowledge, taken considerable pains, by making arrangements with respectable manufacturers, to ensure their being got up at the lowest possible price. Does such a man deserve to be stigmatised as one "who lives but for himself, who would build up his reputation with cash 'wrung from the hard hand of peasants'?"

It will be trespassing too much upon your space to comment at length upon Mr. B.'s insolent and uncalled-for abuse of employers in general, as upon his evident non-information as to what are the generally received theories of political economy, or the effect of improvements in arts and sciences upon labour and labourers, but I would simply ask him if he would go back to the *distaff*, the *flail*, and the *scythe*, and annihilate machinery under the impression that manual labour would find a better market. Mr. Bailey, if a well educated man, or even a man of common sense, ought to be aware that his argument is resting on a false and long exploded foundation.

I have a perfect knowledge of the extent of gravel walks at Trentham, and know well that the calculations given by Mr. Fleming are below the mark; as I perfectly remember how careful he was in making the statement not to over-rate the advantages; I have prepared, from memory, a statement for the accuracy of which I will vouch, but as the result is the same as that published by Mr. F., it will not be necessary to give it, unless circumstances seem to call for it, and I have not now time to copy it.

In conclusion, I would ask every reader of the *Chronicle* to read carefully the leading article in May 3d, and compare it with Mr. Bailey's letter of June 7th. The spirit and tone of the latter will be easily seen. *William Davidson, Weston, Shiffnal, Salop.*

## GARDENERS' BENEVOLENT INSTITUTION.

THE anniversary of this charity was celebrated on Monday by a dinner at the London Coffee House. The object of the Institution, as many of our readers are aware, is to relieve by pensions persons who have been gardeners, and who from age and infirmity have become incapable of earning a living. To assist in the promotion of this object some 120 gentlemen assembled under the presidency of Joseph Paxton, Esq., the designer of the Crystal Palace, among whom were most of the principal horticulturists and market gardeners of the metropolitan district, together with many of the *elite* of the literary world, Messrs. C. Dickens, Douglas Jerrold, Mark Lemon, Wills, and other prominent public writers being present at the principal table, and taking part in the proceedings of the day. The dinner was all that could be desired, and the dessert, which was for the most part supplied by the subscribers of the Institution, was magnificent, and included some splendid Pines from the Pineries of the Dukes of Devonshire and Sutherland; Peaches, Grapes, Strawberries, and other products of the skill of the most famous growers of the country. The cloth having been removed, THE CHAIRMAN gave, as the first toast, "The Queen," which the company responded to with enthusiastic loyalty. The next toast, "Prince Albert, Albert Prince of Wales, and the rest of the Royal family," was also received with loyal honours, and in proposing it the Chairman took occasion to say of Prince Albert that he deserved well of the country in having carried out through evil report and through good report, and amid difficulties of no ordinary kind, a project so grand that the world had never before seen the like (cheers), and when history should record the events of these times, his Royal Highness's name would stand prominently forward as that of one who in his day nobly and successfully fought the battle of social progress and improvement. (Much applause.)

Mr. DOUGLAS JERROLD then rose. He said: Our Chairman has entrusted me with a toast which I am sure you will all join me in drinking with great pleasure —it is the health of his Grace the Duke of Devonshire. (Loud cheers.) This might be an embarrassing duty to me if the name of that illustrious nobleman did not speak for itself—if it did not, as it does contain, an innate lustre which makes it shine by its own light. (More cheering.) The Duke of Devonshire may be considered as one of those just stewards who having received the blessings of Providence, multiply and fructify them by the manner in which he showers them upon others who are less fortunate. (Applause.) Gentlemen, his Grace the Duke of Devonshire has a two-fold claim upon us to-night. In the first place he is connected with the gardeners (great cheering), and in the second, to his well-placed trust and confidence in the genius of our friend the chairman (loud cheers)—to his sympathy with Mr. Paxton in his large and grand ideas of gardening, and its ultimate triumphs, we may attribute that triumph of genius which now asserts itself with a world-wide fame—the Crystal Palace. (Renewed cheering.) I will not longer detain you, but ask you to join with me in cordially drinking the health of his Grace the Duke of Devonshire. (Cheers.) The health was drunk with loud demonstrations of respect.

The CHAIRMAN then proceeded to give the toast of the day—"Success to the Gardeners' Benevolent Institution, and long may it prosper." He said: In placing this toast before you, gentlemen, I am strongly reminded of the assurance of success given at the last annual meeting of the institution. On that occasion you will recollect that a noble lord, distinguished alike for his talent and his virtues, filled the chair. (Hear, hear.) I fear I shall not be able to occupy the position of your chairman as worthily as he did. (Yes.) I shall not be able to entertain you with so poetical an account of the rise and progress of the gardeners' art as he gave you—I cannot tell you what it was in ancient times, and trace its onward progress through various ages, down to our own days—further than to say what all history proves, that in all states, ancient or modern, it is found as gardening has prospered so has the country, and as gardening has declined in any country, in the same proportion has the power and prosperity of the state diminished. We know that the Greeks, when in the zenith of their power, fostered and encouraged the science of gardening to a great extent. They had shops wherein were woven the floral wreaths with which they crowned the brows of their warriors, their poets, and their statesmen. In the latter days of Greece the art of gardening declined, and we find that from the reign of the Emperor Trajan down to the days of George II. very little progress or improvement took place in it—and the Dutch, French, and Italian gardens of that day seem to be nothing more than mere copies of the gardens of Pliny. When our empire increased—when colonies in every part of the world began to be annexed to this kingdom—and our trade, our commerce, and our wealth increased—then we find that gardening began to prosper. (Hear, hear.) The art rapidly progressed, the fruits and the flowers of distant lands were introduced and brought into cultivation here, and we have around us to-day many gentlemen who have expended large sums in transferring to this country the products of other parts of the world. (Hear, hear.) Of course, as the taste for gardening increased, gardeners have multiplied, and, as they multiply, they have, like other men, their alternations of prosperity and adversity—of enjoyment and of suffering; and it not unfrequently happens that a man, who has devoted his industry and his talent to spread fertility over the length and breadth of the land, finds himself in his old age isolated and destitute. (Hear, hear.) Whether from illness or decrepitude—from change of master or from a master's failing—the poor gardener too often finds himself, towards the end of his life, brought to a condition of suffering and distress. Then it is he requires aid to help him on easily through his few remaining days. (Hear, hear.) It was under the influence of a feeling of this kind, that several eminent nurserymen met together in the year 1838, and established the Gardeners' Benevolent Institution (Loud cheers); the purpose of that institution being to give relief, under certain conditions, to head gardeners and their foremen, market-gardeners who have cultivated not less than five acres of ground, and seedsmen and nurserymen who have been in business for a certain number of years, should they be in their old age reduced to a state of destitution. The subscription to this institution is one guinea a year, or ten guineas in one sum for a life subscription. In 1838, the year in which the institution was founded, its income was 50*l.* That income gradually went on increasing until in 1842 it was 100*l.*, and in that year 60*l.* was paid in relieving aged and infirm gardeners. In 1843 a great stimulus was given to the institution; the income rose to 271*l.*, in 1844 it increased to 342*l.*, in 1845 to 414*l.*, in 1846 to 455*l.*, in 1848 to 502*l.*, in 1849 to 552*l.*, and in 1850 to 542*l.* (loud cheering); besides which, the committee had in stock and in hand, a fund of nearly 2500*l.* (Cheers). In the same year, 1850, they paid in pensions 492*l.*, and at this time they have 35 pensioners on the books of the institution. (Cheers.) I think, gentlemen, I have now stated sufficient to assure you that this is an institution which is deserving of your warmest support. (Loud cheers.) I believe it to be one that deserves the support of all the richer classes of society—of all who employ gardeners for their gratification and comfort. I say that no man who is in that position of life, can spend 10 guineas better than by paying it in as a life subscription to this Society (hear, hear); not with the view of placing some particular person on its funds, but with the view of assisting at the proper time, and in the most effectual way, aged and deserving men, who are reduced to want. (Applause.) I rejoice to say that the institution is now making its proper share of progress. (Hear, hear.) In the earlier part of its existence, the subscriptions were confined in a great degree, I believe, to London and its immediate neighbourhood; now I find they are spread all over, not England only, but Ireland and Scotland. (Cheers.) In all parts of the kingdom, persons connected with gardening are beginning to discover that this is an excellent and a great institution, by supporting which they will be not only at once assisting the deserving poor, but may be sowing seeds of which hereafter they may themselves reap the fruits. (Cheers.) One principle of the institution which is worth attention is that it gives a preference to applicants who have subscribed 15 years to the funds, over those who have not subscribed to it at all. I have myself spoken with several gardeners about this institution, and of the great advantage of subscribing to its funds, while they are in a position to do so. I know a case at this time. I will not mention names; but I know a person who is at this moment soliciting the suffrages of the subscribers as an applicant for their bounty, who once moved in very different circumstances. Unfortunately he has not been a subscriber, and though he has many friends in the institution, and is suffering great affliction, it is very doubtful if he can be relieved from its funds. (Hear, hear.) I mention this to show how necessary it is, even as a matter of self-interest, that all who are engaged in the walk of life with which we are connected should unite with such a scheme as this, while it is in their power to do so. (Cheers.) And

when the small cost at which it can be done is considered, I would say to every gardener, to every nurseryman and seedsman, let him pay the first ten guineas of profits he makes into this institution—it will be like putting in seed at the right time, the fruit of which, should he need it, he will reap in due season. (Loud cheers.) England is renowned for the number and extent of its charities; but of all those charities I know of none that deserves better the cordial support of all classes than the Gardeners' Benevolent Institution, success to which, and long may it prosper, is the toast I now beg to propose to you. (The toast was drunk with repeated cheers.)

Mr. C. DICKENS gave the next toast. He said he felt an unbounded and delightful interest in all the purposes and associations of gardening. Probably there was no feeling in the human mind stronger than the love of gardening. The prisoner would make a garden in his prison, and cultivate his solitary flower in the chink of a wall. The poor mechanic would string his Scarlet Bean from one side of his window to the other, and watch it and tend it with unceasing interest. A holy duty it was in foreign countries to decorate the graves of the dead with flowers, and here too the resting-place of those who had passed away from us would soon be gardens; and from that old time when the Lord walked in the garden in the cool of the evening, down to the day when a Poet Laureate sang—

"Trust me, Clara Vere de Vere,
From yon blue heaven above us bent,
The gardener Adam and his wife,
Smile at the claims of long descent,"

at all times, and in all ages gardens were amongst the objects of the greatest interest with mankind. (Loud cheers.) In all ages gardens had been the delight of human nature. (Hear, hear.) There might be a few, but he believed they were but a few, who took no interest in the products of gardening except perhaps in London Pride (a laugh), or a certain degenerate kind of "Stock" which was apt to grow hereabouts, cultivated by a species of frozen-out gardeners whom no thaw could ever penetrate (hear and laughter); except these, the gardeners' art had contributed to the delight of all men in their time. That there ought then to be a Benevolent Provident Institution for gardeners was in the fitness of things, and that such an institution ought to flourish, and did flourish, was still more so. (Hear, hear.) He had risen to propose to them the health of a gentleman who was a great gardener (hear), and not only a great gardener but a great man. (Cheers.) The growth of a fine Saxon root cultivated up with a power of intellect, to a plant that was at this time the talk of the civilised world—he alluded of course to his friend the chairman of the day. (Laughter and much cheering.) He (Mr. Dickens) took occasion to say at a public assembly hard by, a month or two ago, in speaking of that wonderful building Mr. Paxton had designed for the great exposition in Hyde Park, that it ought to have fallen down, but that it refused to do so. (Cheers and laughter.) They had been told that the glass ought to have been all broken, the gutters all choked up, and the building flooded, and that the roof and sides ought to have been blown away; in short that everything ought to have done what everything obstinately persisted in not doing. (Hear, hear, and more laughter.) Earth, air, fire, and water, all appeared to have conspired together in Mr. Paxton's favour—all had conspired to one result, which, when the present generation was dust, would be an enduring temple to his honour, and to the energy, the talent, and the resources of Englishmen. (Applause.) But, said a gentleman to him (Mr. Dickens) the other day, no doubt Mr. Paxton is a great man, but there is one objection to him that you can never get over, that is, he is a gardener; now that was their case to-night—that he was a gardener (cheers), and they were extremely proud of it. (Hear, hear.) This was a great age, with all its faults, when a man by the power of his own genius and good sense could scale such a daring height as Mr. Paxton had reached, and composedly place his form on the top. This was a great age, when a man impressed with a useful idea, could carry out his project without being imprisoned, or thumb-screwed, or persecuted in any form. (Applause.) I can well understand (continued Mr. D.) that you, to whom the genius, the intelligence, the industry, and the achievements of our friend are well known, should be anxious to do him honour by placing him in the position he occupies to-night; and I assure you, you have conferred great gratification on one of his friends, in permitting him to have the opportunity of proposing his health, which that friend now does most cordially, and with all the honours. (Applause.) The toast was responded to with three times three.

The CHAIRMAN, when the cheering had subsided, rose to return thanks. He expressed the pleasure he felt at seeing around him those who had laboured with him in the same vineyard with himself, and some especially who he knew had come up 100 miles from the country to pay him the compliment of being present. That the friends of his youth gathered around him in the day of prosperity, would be an additional stimulus with him to exertion in the path he had chalked out for himself, and would stimulate him to do all he could in furthering the purposes of the institution. (Hear, hear). He would now propose the Vice-Presidents, coupling with the toast the health of Mr. Pownall. One of the Vice-Presidents, the Duke of Northumberland, intended to give the proceeds of the sale of the Stanwick Nectarine to the Institution, which, he hoped, would be a very considerable amount.

Mr. POWNALL returned thanks, and after adverting to the improvements in horticulture which had taken place during late years, and the claims of the gardeners on their attention, he expressed a hope that they might witness the results of their kindness for that class, in the shape of a comfortable asylum for aged and worn-out gardeners.

The CHAIRMAN next gave "Literature," which, he observed, had at all times been closely associated with gardening; coupling with the toast the health of Mr. Charles Dickens.

Mr. C. DICKENS briefly returned thanks. The Secretary then read the list of subscriptions for the evening, which amounted to near 300*l.*, including subscriptions from the Duke of Devonshire, the President, the Chairman, Dr. Lindley, Messrs. Fox and Henderson, Bradbury and Evans, C. Dickens, G. F. Smith, &c.

The next toast was the "Visitors of the day."

Dr. HAMMIL, of St. Petersburgh, acknowledged it, and read a paper on English gardening, in which the science of gardening in this country, to a great extent, and the introduction of numerous natural productions, were traced to John Tradescant, who had been the distant means of forming the first museum of such productions.*

Mr. CHADWICK gave the "Market Gardeners and Horticulturists," which was acknowledged by Mr. Spencer. The next toast was Mr. CUTLER, the Secretary, to whose zeal and attention the chairman paid a fitting compliment, and the other officers of the Institution. The Stewards, and some other toasts followed, after which the company separated at a late hour.

## Home Correspondence.

*Fruit at the Chiswick Exhibition.*—The judges of the exhibition of last Saturday appear to have been as profuse of their awards of medals for the Grapes in Class 3, as they were at the May meeting. In my opinion, one Large Silver and two Knightian, and perhaps one or two Banksian medals, would have been amply sufficient to mark the merits of the choicest samples of the black kinds that were shown. As for the white sorts, they were evidently, with one exception, all more or less unripe; and on what principle the prizes were adjudicated to the growers of them, I cannot imagine. It might, indeed, be said, that from want of sun during the last two months, nothing better could be expected; but then, why exhibit unripe fruit, which in itself is worthless, and of the ultimate quality of which no correct judgment can be formed? By giving prizes for such imperfect specimens, you encourage mediocrity, instead of stimulating to excellence of production. I would therefore hope that in future some stringent rules may be devised by the exhibition committee, with a view to check this abuse of the Society's liberality; and I feel very much inclined to agree with you in thinking that it will be desirable to confine the chief prizes for fruits to the July exhibition. To judge from what I have observed at some of the autumnal provincial shows, it seems to me that we should then have a much better display in Class 3 than we generally see at our garden exhibitions; and to compensate [the growers who may miss the advantages of the May and June meetings, and to incite them to increased exertions, the prizes for fruit at the July show might be on a higher scale than that at present adopted. *A. H.*——I must trouble you again on the vexed question of the white Grape. When I penned my rather hasty observations on Monday, I had not examined the programme of our exhibitions; but on referring to it since, I am inclined to modify my opinion as to the degree of blame attributable to the judges. You offer great prizes, and invite growers to send large collections of fruits to the shows in May and June; and though the specimens sent may be less mature and perfect than could be wished, yet the judges can hardly be expected to incur the odium and clamours that would be excited if they were to say—"We will award no medals for any such unsatisfactory specimens." Besides, they may allege, that in the rules for their guidance there is no longer any stipulation that the fruit shown shall be ripe. They are, however, still liable to the charge of inconsistency. They do not pronounce on the quality of a Melon without tasting it, and they would never think of allotting prizes for green Currants or green Cherries. Why then should they give prizes for green and sour Grapes? I have some doubts whether, in offering prizes for Grapes, it is desirable to specify particular sorts, and whether it would not answer better to say that they would be given "for the best black, and for the best white Grapes." But, if particular kinds must be named, I would not select such common ones as the Black Hamburgh, St. Peter's, or Sweetwaters; not that I undervalue these kinds, for I look upon them as very useful, and consider the Black Hamburgh especially as the most serviceable Grape which the market gardener can grow. My objection to the naming of them is, that they have all been brought to the highest degree of excellence of which they are susceptible, and that we cannot expect to see finer samples of them than have been already shown. Therefore, if names must be given, would it not be more profitable to give those of less known and probably still improvable kinds, such as the Cioutat, Aspiran, &c.? As for white Grapes, I should be content with naming such as the Chasselas and the Muscat. I shall be curious to learn what opinion our foreign visitors will have pronounced on our show of fruits. They will doubtless have admired our Pines, and been astonished at our Strawberries, but I fear they will not give us much credit for our taste in Grapes. *A. H.*

*The Calceolaria.*—I beg to bear testimony to the good effects resulting from the liberal application of well diluted liquid manure to the plants, both in a growing state and also during the blooming season. It has the effect of inducing large and handsome blooms, and causing the foliage to assume a vigorous and healthy appearance. I supply it in shallow feeders, so that the liquid may not stand above the drainage in the pots, and I also use it freely in watering the plants. It should be well diluted with clear water, for I have known it to destroy the plants in a very short period when used full strength from the tanks. I have been a successful cultivator and exhibitor of the Calceolaria for many years, and, as I have already stated, I have found a liberal application of well diluted liquid manure to be of the most essential service; in fact this plant seems to luxuriate in an abundant supply of moisture, and I have never witnessed any ill effects from the use of it. I have always found that plants placed in saucers, or plunged in plunging material, are invariably more healthy and vigorous than those not so treated. *An Exhibitor, Leeds.*

*Shading Plant Houses.*—In reading No. IV. of the useful papers entitled "Orchids for the Million," we thought it would not be amiss to give our plan for arranging shades or blinds on such houses. In the beginning we put them up exactly as there recommended, upon a span-roofed house, 41 feet long, but the weight of the roller at first stretched the canvas at one end so as to cause it to roll up unevenly, and at last with a slight jerk split it for some feet. The first suggestion was to use stronger canvas, but the objection to that was that we should darken instead of shading the house. The plan we hit upon, and which we find to answer perfectly, is as follows:—Procure from the draper a quantity of webbing, from 1¼ to 2 inches wide, commence operations by tacking one end firmly at the top of the first rafter of your house, as high up as you intend your blind to run; unroll it to the bottom, or as far down as you intend the roller to come, then cut it off, miss the first rafter and tack the end of your roll of webbing at the top of the next, unroll the same length, cut off, and do the same to every other rafter. The next operation is to tack the loose ends of your webbing to the roller in such a way that it will roll up and down evenly. Under this plan you can tack on either calico, linen, or canvas, and, as far as the strength is concerned, silver paper. We use unbleached calico, for which we pay 8*d.* per yard double width, that is 2 yards wide, or 4*d.* per square yard. We take the precaution to wet it well before using, as otherwise it will shrink after it is put up, and will look badly and work unpleasantly. *Jessop Brothers, Cheltenham.*

*Pear Tree Astyages.*—I have five trees—two old and three young ones—which I planted last September twelvemonth, and they are all affected by this pest. I scrubbed them in the autumn, using a mixture of lime, sulphur, and soot. The trees were covered with blossom in April and May, and I anticipated that I should have had some fruit set, but on examining them I found the leaves full of the species described in your Number for last week. I immediately mixed some lime and soot in water, and allowed it to stand for a day or so. I then strained the water off clear, and with a fine rose syringe well washed the trees, but all to no purpose. They look like a beggar in rags. I should be very thankful to "J. O. W." for the remedy which was applied to get rid of these pests at Chiswick. *A. R. Hemmings.*

*Fabiana imbricata.*—You state that this is a half-hardy shrub, &c. Here it has withstood the most severe frost, without any protection whatever, and it is now a mass of bloom. *D. Pressly, Gardener, Knockmaroon, near Dublin.*

*Fly Papers.*—Although Mr. Kidd is a studious inquirer into the secrets of nature, and much as I admire the excellent emanations from his pen, yet I think he has exceeded his knowledge of the works of the great Author of nature, or he would not have favoured the poor inventor of those "dreadful fly papers" with such an ignoble character. Pardon my presumption, Mr. Kidd, in endeavouring to reclaim the reputation of a fellow creature, and to set him right in the scale of creation. If our worthy expounder of the claims and capabilities of the charming feathered race, will condescend to examine the mute vegetable kingdom, he will then discover various plants covered with resinous excretions, forming "fatal engines of destruction" to the insect tribe. And may I ask Mr. Kidd if he can apply such an appellation to the inventor of those torturing machines as he has to the man who would think it "folly to be wise." *Curiosus.*

*Pears.*—I find it mentioned at p. 359 *c*, that the Pear "Forelle" is a sort which has stood better than others during the late frosts. My tree flowered earlier than any other kind I have, and all the fruit was cut off, but it is now throwing out a full crop of flower-buds. Do you recommend me to leave them or to pinch them off? *A. R.* [Leave them.]

*Potato Disease.*—I am sorry to inform you that the Potato blight has made its appearance again in this country. I have inclosed you two or three leaves which were attacked yesterday morning; I fear that we shall have it as badly as ever, as it is much earlier than ever it appeared before here. Is it better to cut the haulm off at once, do you think, or what is the best thing to be done? *Wm. Dickens, Peterstow, near Ross, Hereford.* [We do not feel satisfied that this is a case of Potato disease. The appearances seem to be owing rather to cold and wet than to disease.]

*Asparagus.*—"J. W." must excuse me for still being sceptical, as regards the merits of his plan for the early forcing of Asparagus, until further evidence of its utility is adduced. It is facts, and not assertions, that we require, in order to arrive at correct conclusions in gardening practice. I shall, therefore, be obliged to "J. W." if he will give us the width of his beds, and keep an account of the quantity and weight of Asparagus cut during the next season, from December 16th to April 1st, and communicate the same to the *Gardeners' Chronicle*. Such information will enable us to form some opinion of the merits of his system; at least, as far as labour, expence, and produce of one season are concerned—but

* We hope to be able to publish next week a communication from Mr. Paxton on this subject.

it must be borne in mind that my plan is only part of a 12 years' rotation of kitchen garden cropping. *J. P., Stoke Rochford.*

## Societies.

HORTICULTURAL; GARDEN EXHIBITION, *June* 7.—The leading feature of this, in all respects excellent, Midsummer Show, being touched upon in another column, we shall, as before, confine ourselves here strictly to details.

In collections of 20 STOVE and GREENHOUSE PLANTS, the first prize was awarded to Mr. May, gr. to Mrs. Lawrence, of Ealing-park, for a group whose excellence has never before been approached, even in England itself. It contained a specimen of Polygala acuminata, quite 7 feet in diameter, beautifully flowered, round and well-proportioned; another, equally large and fine, of Pimelea spectabilis, which was the admiration of everybody. This was literally one mass of white, fresh, and beautiful flowers. These were in wooden tubs, the largest sized pots being too small for them. Associated with them were the rosy-flowered Pimelea Hendersoni, an admirable specimen of a somewhat slow-growing plant. Eriostemon buxifolium, rather past the best; Erica tricolor rubra, wonderfully fine; Pimelea decussata; Azalea variegata; two of the best varieties of Aphelexis; Chorozema Henchmanni; the graceful Coleonema rubrum; Leschenaultia formosa, and the blue variety; the Cavendish Heath; the glowing Azalea magnifica; the exceedingly handsome Dipladenia crassinoda, beautifully flowered: the Scarlet Ixora, and a large and finely managed Epacris grandiflora. The second prize was awarded to Mr. Cole, gr. to H. Colyer, Esq., of Dartford, for an exhibition of finely grown plants, though for the most part much inferior to the magnificent specimens produced from Ealing-park. It comprised Polygala cordifolia, Pimelea decussata, a finely blossomed Stephanotis floribunda, Dipladenia splendens, with three clusters of glorious flowers; the Gledstane Azalea, three Everlastings, a handsome Pimelea Hendersoni, the Cavendish Heath; an Azalea, composed of lateritia, Gledstanesi, and variegata, all worked together on one stem, the different colours effecting a charming contrast; the Scarlet Ixora, beautifully bloomed; a well-cultivated Franciscea acuminata, Sphenotoma gracilis, a useful plant for cutting from; Leschenaultia formosa, the Showy Rondeletia, a variety of the Three-coloured Heath, and Eriostemon cuspidatum.—A third group was contributed by Messrs. Fraser, of Lea-bridge. It consisted of Epacris grandiflora, the showy Clerodendron Kæmpferi, bearing two great panicles of flowers; Polygala acuminata, the handsome Azalea præstantissima, Erica perspicua nana profusely bloomed, Coleonema rubrum, the Saffron Ixora, the Box-leaved Eriostemon, the yellow-blossomed Hibbertia Cunninghami, the Blue Leschenault, Pimelea Hendersoni, the Cavendish Heath, Chorozema varium nanum, Azalea variegata, an Everlasting, the Scarlet Ixora, Boronia serrulata, the snowy white-flowered Sphenotoma gracilis, and Pimelea decussata.—Mr. Stanly, gr. to H. Berens, Esq., of Sidcup, Kent, communicated Zichya inophylla, a white Azalea, Leschenaultia formosa, the purple-blossomed Chironia glutinosa, Erica Cavendishii, the sweet-smelling Stephanotis floribunda, the Large-flowered Epacris, Clerodendron Kæmpferi, the White Vinca, the free flowering Erica perspicua nana, Polygala oppositifolia, and one of the best varieties of Aphelexis.—Mr. Pamplin, of Leabridge-road, sent a fifth group, in which were Erica Bergiana, profusely clothed with little purple bells; the Box-leaved Eriostemon, the Cavendish Heath, Polygala oppositifolia, an Everlasting, Rhynchospermum jasminoides, the brilliant Epacris miniata, Pimelea lanata, Gompholobium polymorphum, trained in the form of a bush; and an example of the Myrtle-leaved Eutaxia.

In collections of 15 STOVE and GREENHOUSE PLANTS, the first prize was awarded to Mr. Green, gr. to Sir E. Antrobus, Bart., of Cheam. In this group we remarked well-managed plants of Ixora coccinea; the clear yellow-flowered Allamanda grandiflora, the Opposite-leaved Polygala, Rondeletia speciosa, the variegated Azalea, Boronia serrulata, the beautiful variety of Erica tricolor called Wilsoni, the blue and red Leschenaults, an Everlasting, Chorozema varium nanum, the neat rosy-flowered Adenandra fragrans, the Cavendish Heath, and Polygala Dalmaisiana.—Mr. Carson, gr. to W. F. G. Farmer, Esq., of Cheam, sent the next best group, in which were the Variegated Azalea, a finely managed Stephanotis floribunda, Allamanda cathartica, the Fortune Gardenia, splendidly flowered, and exceedingly beautiful; an admirable Ixora coccinea, Franciscea acuminata, a neat Leschenaultia formosa, Dipladenia crassinoda, trained on a globular wire trellis; a good variety of Everlasting, the Baxter Leschenault, Polygala acuminata, the sweet-smelling Sphenotoma gracilis, a pretty rosy Azalea called Bella, the Anemone-leaved Boronia, and Polygala Dalmaisiana.—A third group was furnished by Mr. Taylor, gr. to J. Coster, Esq., of Streatham. It consisted of Pimelea decussata, the large-flowered variety of Aphelexis spectabilis, Sphenotoma gracilis, the Cavendish Heath, Azalea formosa elegans, the beautiful Boronia pinnata, the fragrant Stephanotis floribunda, very full of bloom; Leschenaultia formosa, the Opposite-leaved Polygala, the variety of Erica tricolor called dumosa, Allamanda cathartica, the Henderson Pimelea, Azalea variegata, an Everlasting, and a charming example of the Saffron Ixora.

Ten STOVE and GREENHOUSE PLANTS were furnished by Mr. Speed, of Edmonton, and Mr. Croxford, gr. to H. Barnes, Esq., of Stamford Hill; Mr. Speed's plants, which were beautifully grown, consisted of a lovely Dipladenia crassinoda, a well-flowered Clerodendron fallax, Stephanotis floribunda, Coleonema rubrum, the White Vinca, the Violet-flowered Tetratheca verticillata, the purple Chironia glutinosa, two charmingly managed Cape Heaths, and Cyrtoceras reflexum.—Mr. Croxford had a very nice Stephanotis floribunda, Epacris grandiflora, Crowea saligna, insufficiently advanced in flower; Polygala acuminata, the brilliant Epacris miniata, two Everlastings, the Cavendish Heath, Pimelea Hendersonii, and the Swan River Chorozema varium.

In the class of 6 STOVE and GREENHOUSE PLANTS there were five exhibitors, all of whom produced creditable collections. By far the best group, however, was furnished by Mr. Kinghorn, gr. to the Earl of Kilmorey, who sent Aphelexis humilis; an admirable bush of Azalea Gledstanesi and lateritia, "worked" together; an excellent variety of Epacris miniata, the blue Leschenault, a large Pimelea decussata, and a beautifully blossomed Erica perspicua nana.—Mr. Watson, gr. to Mrs. Tredwell, who was second, had Hoya carnosa, Stephanotis floribunda, the useful Justicia carnea, the violet Tetratheca verticillata, Pimelea decussata, and Polygala Dalmaisiana.—A third group from Mr. Hamp, gr. to J. Thorne, Esq., consisted of the Red Coleonema, Pimelea decussata, the useful Sphenotoma gracilis, an Everlasting, Polygala cordifolia, and Acrophylla venosum.—Mr. Stuart, gr. to T. Huggins, Esq., of Norwood, produced Pimelea Hendersoni, the purple variety of Aphelexis macrantha, Erica depressa, Polygala Dalmaisiana, Aotus linophylla, rather a pretty plant, and Pimelea decussata.—From Mr. Williams, gr. to C. B. Warner, Esq., came Aphelexis splendens, the free-flowering Erica ventricosa coccinea minor, the Opposite-leaved Polygala, a neat well flowered plant of the Fortune Gardenia, with large white waxy blossoms just in perfection; the showy Azalea fulgens, and Boronia serrulata.

HELICHRYSUMS.—Collections were shown by Messrs. Green (1), Cole (2), Watson (3), and Taylor (4). In these we remarked Aphelexis macrantha purpurea, A. spectabilis, sesamoides, and its large variety, humilis, and Phænocoma proliferum.

ORCHIDS.—Fine as these were in May, they were equalled both in quality and quantity on Saturday last. Mr. Rucker's gardener, Mylam, again produced an excellent group. It consisted of Odontoglossum citrosmum, finely flowered and wonderfully coloured; a nice bush of the Purple Camarote, the Sweet Vanda, the Large-flowered Butterfly plant (Phalænopsis grandiflora), the brown Oncidium crispum, in fine condition; Aerides virens and crispum, Anguloa uniflora, quite a mass of white flowers; small plants of the purple Saccolabium ampullaceum and the singular-looking Odontoglossum niveum; Chysis bractescens, Lycaste Deppei, beautifully blossomed; the rare Dendrobium Dalhousieanum, the curious rather than beautiful Cœlogyne Lowii, the Three-coloured Vanda, the showy Moss Cattleya, the yellow-flowered Anguloa Clowesii, and the curious green-blossomed Cycnoches chlorochilum.—The second prize was awarded to Mr. Blake, gr. to J. H. Schröder, Esq., of Stratford, for a splendid specimen of Phalænopsis quite a mass of lovely blossoms; Oncidium ampliatum, finely flowered; the charming Dendrobium Devonianum, the Clowes Anguloa, a variety of the Aromatic Lycaste, Aerides affine and crispum, a large plant of Dendrobium sanguinolentum; the Bearded Lady's Slipper, the beautiful Epidendrum cinnabarinum, the Three-coloured Vanda, Dendrobium chrysanthum, Oncidium Papilio, the snowy white Calanthe veratrifolia, Schomburgkia tibicinis, Vanda cristata, and Epidendrum cochleatum.—Mr. Franklin, gr. to Mrs. Lawrence, obtained a third prize for a charmingly-flowered example of the Moss Cattleya, Oncidium flexuosum, beautifully managed; a Phalænopsis, the Roxburgh Vanda, the Twisted Trichopil, Vanda teres, the Clowes Anguloa, bearing four large clear yellow flowers; Sobralia macrantha, with seven large purple blossoms; the orange Epidendrum vitellinum, Acineta Humboldti, in beautiful condition; Epidendrum crassifolium, the handsome Odontoglossum hastilabium, the Long-tailed Angrec, Brassia Wrayæ, the rare and beautiful Cattleya Aclandiæ, Stanhopea oculata, and a highly-coloured Vanda tricolor.—Mr. Williams, gr. to C. B. Warner, Esq., of Hoddesdon, had a well-managed example of Dendrobium Pierardi major, Aerides odoratum, the singular Oncidium phymatochilum, Cœlogyne Lowii, the charming Saccolabium guttatum, a Phalænopsis, a variety of Aerides crispum, the African Ansellia, a neat bush of Dendrobium cærulescens, a variety of Vanda Roxburghi, Brassia verrucosa, one or two Aerides, the Bearded Lady's Slipper, and a few other plants.

In the Nurserymen's Class of 15 ORCHIDS, Messrs. Veitch and Rollisson produced collections. The former sent Sobralia macrantha, with 10 large flowers on it; a beautifully blossomed Oncidium sphacelatum, the Noble and Close-flowered Dendrobes, Calanthe veratrifolia, with 9 flower spikes; Saccolabium præmorsum, in charming condition; three species of Aerides, the Moss Cattleya, Cypripedium barbatum, Brassia caudata, and the white Butterfly plant (Phalænopsis).—Messrs. Rollisson had a spreading Oncidium sphacelatum, Brassia verrucosa, beautifully flowered; the white, yellow-stained, Dendrobium formosum, the Moss Cattleya, Saccolabium guttatum, the Twisted Trichopil, Saccolabium præmorsum, Miltonia spectabilis, a small plant of Burlingtonia venusta, Aerides odoratum, Stanhopea oculata, the white Butterfly plant, Sobralia macrantha, and the Dalhousie Dendrobe.

Collections of 10 ORCHIDS were contributed by Mr. Carson, gr. to W. F. G. Farmer, Esq., and Mr. Wooley, gr. to H. B. Ker, Esq. Mr. Carson sent Acineta Humboldti in a square wire basket, producing eight flower spikes; Oncidium flexuosum, one of the best of the small brown and yellow flowered kinds; Brassia brachiata and verrucosa, the Bearded Lady's Slipper, the Spotted Saccolabe with five nice flower spikes, Anguloa Clowesi insufficiently in flower, Aerides crispum, the purple Epidendrum phœniceum, and a finely flowered Moss Cattleya.—Mr. Wooley produced the Aloe-leaved Cymbid, a small example of Dendrobium Farmeri, Sobralia macrantha, with three open flowers on it; Peristeria elata, beautifully blossomed; the Brazilian Oncidium flexuosum, Epidendrum crassifolium, the spotted Saccolabe, the Moss and Forbes Cattleyas, the latter in lovely condition, and Vanda Roxburghi.

Groups of 6 ORCHIDS were communicated by Messrs. Kinghorn, Ivison, and Green. The former had the white Butterfly plant, bearing a spike of flowers upwards of 2 feet in length, the larger variety of Oncidium ampliatum charmingly blossomed, Calanthe veratrifolia producing six flower spikes, the Intermediate and Forbes' Cattleyas, and a neat Dendrobium cærulescens. Mr. Ivison sent two nice examples, Oncidium luridum guttatum, and O. altissimum; Epidendrum macrochilum, Brassia maculata, the Three-coloured Vanda, and the pale variety of Cattleya labiata. Mr. Green contributed Brassia Wrayæ, Oncidium altissimum, Epidendrum crassifolium, Oncidium divaricatum, a pretty species, and an Epidendrum.

Mr. Cole showed a large plant of Dendrobium Calceolaria as a single specimen, together with Stanhopea tigrina, with two fine flowers on it; and Messrs. Henderson produced Broughtonia violacea.

PITCHER PLANTS.—Messrs. Veitch sent a charming collection, in which were noble examples of Nepenthes Rafflesiana, sanguinea, lævis, distillatoria, phyllamphora, ampullacea, and albo-marginata; together with Sarracenia purpurea, flava, Drummondi, and variolaris. Being fine specimens and neatly arranged, these attracted, and deservedly, a large share of attention.

AZALEAS were again produced by Mrs. Lawrence and Mr. Green, but their glory was evidently past. The sorts consisted of decora, variegata, Minerva, optima, Rawsoni, Gledstanesi, alba superba, lateritia, rosea punctata, and præstantissima.

TALL CACTI in flower were furnished in good condition by Messrs. Green and Falconer. The varieties were Epiphyllum rubrum cœruleum, speciosum, s. elegans, Ackermanni, Jenkinsoni, Cereus Mallesoni, its pale variety, and C. speciosissimus.

ROSES in pots, though greatly admired, were hardly so fine as they were in May. The gems of Messrs. Lane's group, which was first, were Chenédolé, beautifully blossomed, Celine, and Souvenir de la Malmaison.—Mr. Francis produced Coupe d'Hébé, Wm. Jesse, Pauline Plantier, Sophie de Houdilot, Souvenir de la Malmaison, Belle de St. Cyr, Reine du Vierges, Baronne Prevost, Triomphe de Laqueue, Duc de Cazes, Aubernon, and Las Cazes.—In the Amateur's Class, the 1st prize was awarded to Mr. Terry, gr. to Lady Puller, for nice plants of Persian Yellow, Robin Hood, Coupe d'Hébé, Sophie de Marcilly, Colonel Coombs, Œillet Parfait, Mrs. Bosanquet, Souvenir de la Malmaison, Charles Duval, Chenédolé, Elise Sauvage, and Baronne Prevost.—Mr. Rowland, who was second, had excellent examples of Souvenir d' un Ami, large and sweet; La Reine, in good condition; Blairii, No. 2, and Chenédolé.—Collections, both cut and in pots, were also contributed by Mr. Roser, and Mr. Francis showed the following yellow varieties in a cut state—Williams' Double Yellow, Single Yellow, Yellow Banksia, Elise Sauvage, Harrisonia, and Smith's Yellow.

CAPE HEATHS were plentiful, well cultivated, and finely flowered. Prizes were awarded for them to Messrs. Rollisson, Fairbairn, and Frazer; and in the Amateurs' Class to Mr. Smith, gr. to J. Quilter, Esq., of Norwood, and Mr. Cole, gr. to J. Collyer, Esq., of Dartford. In the different exhibitions we remarked suaveolens, tricolor Leeana, t. Wilsoni, metulæflora, denticulata moschata, depressa, ventricosa grandiflora (the very best of its class), v. coccinea, v. breviflora, v. prægnans, v. alba tincta, v. perspicua nana, Cavendishii, splendens, halicacaba, ampullacea vittata, florida, mutabilis, elegans, Humeana, Shannoni, Alberti, vestita coccinea, odora rosæ, Vernoni, gemmifera, and tortiliflora. Messrs. Henderson, of Pine-apple-place, showed a seedling called Grandis, which is distinct, and promises to be a good red kind.

SINGLE SPECIMENS.—The best of these were an exceedingly handsome standard yellow Rhododendron from Mr. Edmonds, gr. to the Duke of Devonshire, at Chiswick-house; a fine bush of Erica metulæflora, from Messrs. Veitch; noble examples of Erica Cavendishii, Pimelea Hendersoni and Leschenaultia formosa, from Mr. Kinghorn and Mr. Cole; the larger variety of the blue Leschenaultia, from Mr. May, gr. to Mrs. Lawrence; and Clerodendron fallax, in admirable condition, from Mr. Speed, of Edmonton.

NEW PLANTS.—Messrs. Veitch sent a yellow shrubby Calceolaria from Peru, Dendrobium Veitchianum, Cantua dependens, Deutzia gracilis, and a species o Eurybia? from New Zealand, with close heads of dingy white Aster-like flowers; Clerodendron Bethuneanum, came from Mr. Speed; Gastrolobium cuneatum, from Messrs. Henderson; and Mr. Williams sent Trichopilia coccinea. We also remarked a variegated leaved

Hydrangea japonica, and a Sinningia named punctata, an improvement on the old kind; the latter was contributed by Mr. E. G. Henderson.

Messrs. Veitch showed a branch of Eucalyptus coccifera, a strikingly ornamental tree, and found to be perfectly hardy at Exeter. It has blossomed every season in the greatest profusion for these many years past. They had also a branch from the open wall of their Escallonia macrantha.

Daisies.—A named collection was shown by Mr. Salter, of Versailles Nursery, Hammersmith, in which the best sorts perhaps were Leontine, Coquette, Charlotte, Jupiter, Decora, Bacchus, Gertrude, Bertha, and Amalie Winter.

Alpines.—Exhibitions of these were furnished by Mr. Wood, of Norwood, and Mr. Turner, of Barnes Common. In these we remarked the pretty early Squill (Scilla verna), Ajuga reptans, Potentilla tridentata, Oxytropis uralensis, Stachys corsica, Saxifraga pyramidalis, Phlox nivalis, Linaria alpina and Hepaticæfolia, Lychnis viscaria, and Primula farinosa.

Mr. Wood produced a small group of variegated plants, whose names we have given on a former occasion.

Pelargoniums were shown in excellent condition, and in tolerable abundance.—Mr. Gaines, of Battersea, obtained the first prize for 12 plants in 8-inch pots. The sorts were: Duchess of Argyll, Aspasia, Prince of Orange, Negress, Mont Blanc, Rosamond, Mars, Salamander, Centurion, Painted Lady, Firebrand, and Star. A second prize was awarded to Mr. Bragg, of Slough, for Forget-me-not, Roseum elegans, Star, Ariel, Norah, Narcissus, Victory, Gulielma, Nepaulese Prince, Conspicuum, Knight of Avenal, Lord Gough. Nine plants in 11-inch pots; 1st, Mr. Chapman, Turnham-green, for Negress, Luna, Duke of Cornwall, Camilla, Emperor, Rosy Circle, Forget-me-not, Salamander, Adonis; 2d, Mr. Gaines, for Mars, Aspasia, Negress, Rosamond, Marion, Orion, Xarifa, Chieftain, Gulielma.

Fancy Pelargoniums.—1st prize to Mr. Ambrose, of Battersea, for Defiance, Reine des Francais, Formosum, Cleopatra, Fairy Queen, and Modestum; 2d, Mr. Gaines, for Hero of Surrey, Madame Rosatti, Orestes, Reine des Francais, Odoratum, Magnificum, and Lady St. Germans; 3d, Mr. E. G. Henderson, Wellington Road, for Mrs. Loudon, Alboni, Annette, Prima Donna, Victoria, Princess Maria, and Galitzin; 4th, Mr. Bragg of Slough.

Cape Pelargoniums were exhibited by Mr. Parker, gr. to J. M. Strachan, Esq., of Teddington, and Mr. Stanly, gr. to H. Berens, Esq., Sidcup, Kent. The sorts were tricolor, flexuosum, glaucifolium, glaucum, Blandfordianum, quinquevulnerum, ardens, bicolor, and elatum.

Three seedling hybrid Pelargoniums of an entirely new description, of which some account will be found in another column, were shown in the seedling tent by Mr. Kempster, gr. to E. Fellows, Esq., Blackheath Park. The best was named Citriodorum grandiflorum.

Calceolarias.—Collections were contributed by Mr. Franklin, gr. to Mrs. Lawrence, and Mr. Chapman, of Turnham Green. The former had Elegans, Earl of Roslyn, Admiral, Goldfinch, Isabella, Alonza, Lord Byron, Grandiflora, Bridal Ring, Miss Talbot, and Lucy Ashton. The latter sent Success, Cavalier, Florabunda, Sidonia, Crocus, Marion, Alpha, Cardinal, Sappho, Prince of Wales, Cleopatra, and Keepsake.

Pansies in pots were shown in good condition by Mr. Francis, of Hertford, and Mr. Bragg, of Slough. The former had Juventa, Duke of Norfolk, Marchioness of Lothian, Mrs. Beck, Penelope, Lucy Neal, Aurora, Purity, Androcles, Supreme, and Miss Edwards. Mr. Bragg produced Junius, Industria, Clotno, Vulcan, Viceroy, Queen of England, Lucidum, Magnificent, Snowflake, Lucy Neal, Madame Sontag, and 2 seedlings.

A neat collection of 30 Ranunculuses was furnished by Mr. Costar, of Benson, Oxon. It consisted of Maria, Mrs. C. Turner, Mr. Shelling, Apollo, Atlas, Joseph Paxton, Dr. Lindley, Eliza Cook, Mr. Tyso, Lady Sale, Lord Gough, Regalia, African, Mr. Wolland, Sophia, Medora, Delectus, Naxara, Cedo Nullii, Squire Devenish, Sabina, Victoria, Alice Maud, and Gentoo.

Pinks.—Owing to the lateness of the season only one collection was exhibited. It came from Mr. Willmer, of Sunbury, and consisted of Merope, Jenny Lind, King of Purples, Lola Montez, Harry, Morning Star, Laura, Village Maid, Coronation, Oxoniensis, Surplus, and Lord J. Russell.

Very fine cut blooms of Mesembryanthemums, purple and yellow, were shown by the Hon. Fox Strangways, as examples of the climate of Abbotsbury, in Dorsetshire.

Fruit, with one or two exceptions, was not above mediocrity. There were three or four good Queen Pine-apples, but Providences were light and small. Black Grapes, Sweetwaters, and Frontignans were tolerably good; but Muscats, although sufficiently ripe for market, were deficient in that golden colour which is so highly desirable in that esteemed variety.—Mr. Fleming, gr. to the Duke of Sutherland, at Trentham, had the best collection of fruit. It contained a Providence Pine-apple, Trentham Hybrid and Hybrid Dampsha Melons, 3 bunches of Black Hamburgh Grapes, 3 ditto of Muscat of Alexandria, 3 ditto of Chasselas Musqué, Royal George Peaches, Murray Nectarines, May Duke Cherries, British Queen Strawberries, and Figs. We believe that it was the opinion of the judges that one of the above Melons was the best flavoured of any exhibited.—The next collection came from Mr. Chapman, gr. to J. B. Glegg, Esq., of Withington Hall, Cheshire. It consisted of a Providence Pine-apple, Black Hamburgh, Purple Frontignan, and Chasselas Musqué Grapes, Cuthill's Scarlet-fleshed Melon, Grosse Mignonne and Bellegarde Peaches, Scarlet and Newington Nectarines, and Keens' Seedling Strawberries. We may remark, that the Peaches and Nectarines in this collection were extremely fine.

Pine-Apples.—Mr. Floud, gr. to C. Bailey, Esq., Aberaman House, Glamorganshire, furnished a finely-swelled Queen, weighing 5 lbs. 14 ozs. The same kind of Pine-apple, weighing 4 lbs. 12 ozs., came from Mr. Hoare, gr. to J. Bailey, Esq., Glanusk Park, Brecknock, who also exhibited several other Queens, nearly equal to the above, both in weight and quality. The third prize for this description of fruit was awarded to Mr. Frost, gr. to E. L. Betts, Esq., Preston Hall, near Maidstone. In the Market Gardeners' Class, the best Queen was shown by Mr. Harrison, of Oatlands Palace Gardens, Weybridge. A Providence, which was only considered worthy of a second prize, was exhibited by Mr. Slowe, gr. to R. W. Baker, Esq., of Bayfordbury, and a somewhat inferior, although heavier, fruit, by Mr. Drummond, gr. to C. H. Leigh, Esq., of Pontypool Park. The best Providence was that shown in the market-gardeners' class, by Mr. Davis, of Oak Hill, East Barnet; it weighed 6 lbs. 11 oz., which we need hardly say is light for this variety of Pine-apple.

Grapes.—Exhibitions of Black Hamburgh were numerous, and, as we have stated, generally good. Mr. Slowe produced beautiful bunches, and so did Mr. Ingram, gr. to her Majesty, at Frogmore, and very good fruit, of Wilmot's Black Hamburgh, which, though large, and well coloured, has the disadvantage of being thick skinned, came from Mr. Boyd, gr. to Viscount Dillon, Ditchley, Eustone. In the Market Gardeners' class, Mr. Davis, of Oak Hill, had the best bunches; but excellent examples were also contributed by Mr. Mitchell, of Brighton, and Mr. Harrison, of Oatlands. Sweetwaters came from Mr. Smith, gr. to S. Ricardo, Esq., and Muscadines from Mr. Rust, gr. to J. Maclaren, Esq., and Mr. Challis, gr. to Miss Irvine, at Egham. The best Muscats were produced by Mr. Turnbull, gr. to the Duke of Marlborough, at Blenheim, and very good exhibitions of this kind of Grape were furnished by Mr. Ingram and by Mr. Cox, gr. to J. Tredwell, Esq., Leigham-court, Brixton Hill. In the Market Gardeners' class, Mr. Harrison had the best fruit. White Frontignans came from Mr. Bain, gr. to B. Bernasconi, Esq., Harrow Weald, Mr. Cox, and Mr. Smith.

Peaches.—The best dish was communicated by Mr. Collinson, gr. to the Marquis of Westminster, Eaton Hall, Cheshire. The sort was Royal George. The same variety, and Violette Hative, came from Mr. Slowe, gr. to R. W. Baker, Esq. Mr. Davis's Noblesse was the only exhibition in the Market Gardeners' class.

Melons were generally indifferent in flavour. The best was a green-fleshed, from Mr. Ewing, gr. to O. F. Meyrick, Esq., Bodorgan Hall, Anglesea. The second best (hybrid Persian) came from Mr. Robertson, gr. to Lady Foley, Stoke Edith-park, Ledbury. A third prize was awarded to a Bromham Hall, furnished by Mr. Smith, gr. to S. Ricardo, Esq. Other varieties of Melons consisted of Snow's Green-fleshed, Emperor (green-fleshed), Lord Glinco, Victory of Bath, Parker's Hybrid, Fern-hill Green-fleshed, and Trentham Hybrid.

Strawberries.—By far the best were furnished by Mr. Ingram, gr. to her Majesty at Frogmore. The variety was British Queen, which was well coloured even to the tips of the fruit—a circumstance rare with this kind. Dishes of the same variety were also contributed by Mr. Elliott, gr. to Mrs. Boothby and Mr. Mann, of Isleworth.—The best Keens' Seedlings were shown by Mr. Turnbull, and the same sort came from Mr. Mann and Mr. Harrison, market gardeners. There were three collections of Strawberries in pots; the best was that of British Queen from Mr. Elliott, gr. to Mrs. Boothby.

Mr. Ivison, gr. to the Duchess Dowager of Northumberland, furnished plants bearing fruit, both in a ripe and unripe state, of Nutmeg, Gamboge, and Vanilla. He had also the Cinnamon tree in flower, together with dry Cinnamon produced from it at Syon; and unripe examples of the Serpent Cucumber.—Mr. Braid, gr. to H. Perkins, Esq., at Hanworth-park, exhibited a large mass of the fruit of the Cavendish Musa.

---

Royal Botanic, *June* 11.—The plants mentioned in the preceding report having been very generally reproduced at this show, we confine our observations entirely to such subjects as we did not remark at Chiswick.

A collection of Orchids was produced by Mr. Barnes, gr. to R. Hanbury, Esq., at the Poles, Hertfordshire, in which there was an admirable example of the handsome Cypripedium spectabile, which, being hardy, is alike suitable for pot or out-door cultivation. He had also Bolbophyllum Lowii, and a well-flowered plant of Barkeria spectabilis.

Fuchsias.—Two groups were produced in which were Newtoniensis, Corallina, Elegantissima, Dr. Smith, Admirable, Crimson King, Acantha, Exoniensis, Miss Roberts, Cassandra, Cleopatra, and Dr. Jephson.

Pansies.—A first prize was awarded to Mr. Turner, and a second to Mr. Bragg, both of Slough. The following varieties were shown in good condition: Blanchae, Diadem Lucy Neal, Duke of Perth, Swansdown, Mrs. Beck, Lord Walshingham, Mr. Beck, Addison, and Queen of England, and a highly promising Seedling named National.

Ranunculuses were shown in good condition by Mr. Carey Tyso, of Wallingford. The sorts were, Apollo, Irreproachable, Milo, Naxara, Dr. Channing, Gomer, Brinus, Lady Dartmouth, Burns, Amasis, Kilgour's Princess, Milo, Coronation, Carouse, Highland Venus, Sabina, Dido, Mrs. Neilson, Dr. Neill, Beroth; and the following Seedlings of Mr. Tyso's: Exhibitor, Festus, Olympia, Alexia, Dilectus, Protector, Hephzibah, Felix, Lambton, Victor, and some unnamed varieties.

Pelargoniums were shown in great abundance and in excellent condition. The prizes offered by the "Seedling Pelargonium Fund" were contested for on this occasion, on which the following raisers were contributors, and many varieties were represented by two, three, and four plants: From Mr. Beck, were Incomparable, Gem, Arethusa, Ambassador, Painter Improved, Cardinal, and Exhibitor; from Mr. Story, Purity; from Mr. Hocken, Nightshade and Honeybell; from Major Foquett, Annette and Agatha; from Mr. White, Charming May and Martile; from Mr. Bragg, Jullien; from Mr. Turner, Flying Dutchman, Vivid, Supreme, Little Nell, Proteus, Breba, Cynthia, Sheet Anchor, and Illuminator; from Mr. Foster, Scarlet Eclipse, Shylock, Lablache, Optimum, Purple Standard, Rubens, Ariadne, Euridice, Enchantress, Pulchrum, Lavinia, Melissa, and Pansy; from Mr. Hoyle, Beatrice, Elise, Herald, Magnet, Ganymede, Remus, Chieftain, Azim, Colonel of the Buffs, and Van Tromp. The Censors, Messrs. Riley, Stains, Veitch, and Robinson, furnished the following award: First prize, Magnet (Hoyle); second do., Purple Standard (Foster); third do., Elise (Hoyle); fourth do., Ganymede (Hoyle); fifth do., Scarlet Eclipse (Foster); sixth do., Arethusa (Beck); seventh do., Herald (Hoyle).

Seedling Fancy Pelargoniums were shown in classes, the division of colours being—class A., light flowers, not darker than Modestum; class B, rose flowers, not darker than Minerva; class C, crimson flowers, not darker than Fairy Queen; class D, dark, not lighter than Hero of Surrey; class E, dark self, not lighter than Defiance; in these classes 34 varieties were shown. The censors made the following award—Class A, none worthy; class B, Mirandum (Ayres), a second prize; class C, Formosissimum (Ayres), a first prize; Perpetuum, (Ambrose), a second prize; Triumphant (Ambrose), a third prize; class D, Superbum (Ambrose), a first prize; Richard Cobden (Ambrose), a second prize; Caliban (Ayres), a second prize (equal); Gipsey Queen (Ayres), a third prize; class E, Captivation (Ambrose), a first prize, Advancer (Ayres), a second prize.

The Society's certificates were awarded to Ariadne (Foster), and Elise (Hoyle). A small silver medal was awarded to Magnet (Hoyle), for an exhibition of four plants; the same variety receiving the Society's certificate at the previous exhibition.

In Fancy Pelargoniums, Superbum (Ambrose), Captivation (Ambrose), and Advancer (Ayres), were selected by the Society's censors for certificates.

Ferns.—Interesting exhibitions were produced by Mr. Williams, gr. to C. B. Warner, Esq., Mr. Wooley, gr. to H. B. Ker, Esq., and Mr. Fletcher, gr. to Dr. Young. Among Mr. Williams' British kinds, we remarked wonderful specimens of Woodsia ilvensis, and Asplenium germanicum, both difficult sorts to manage. Hymenophyllum Tunbridgense was also unusually well fruited.

Lycopods.—A very good collection of these was shown by Mr. Fletcher, gr. to Dr. Young, of Kennington. It consisted of L. cæsium arboreum, cordifolium, plumosum, Louisianum, lepidophyllum, apodum, circinale, pusillum, stoloniferum, Willdenovi, denticulatum, Braziliense, umbrosum, and apothecum.

Fruit.—A Queen Pine, weighing 4 lbs. 5 oz., was shown by Mr. Bray, gr. to E. Lousada, Esq.; and Mr. Fleming, gr. to the Duke of Sutherland, had a Providence, weighing 7½ lbs.—A very fine fruit of this description of Pine-apple was produced from Chatsworth, by Mr. Paxton, not for competition. It weighed 8 lbs. 3 oz. Other Pine-apples, though good, were inferior to these.

The best Black Hamburgh Grapes were furnished by Mr. Fleming. The bunches were large, well swelled, and finely coloured.—Mr. Harrison, of Oatlands, had good Muscats; but they were deficient in colour.—Mr. Turnbull had large fruit of this Grape; but it was not half ripe.—Very fine Grizzly Frontignans came from Mr. Henderson, gr. to Sir George Beaumont, Bart.; and the best white Frontignans came from the garden of the Hon. E. Strutt.

Peaches.—Excellent specimens of Noblesse were shown by Mr. Paterson, gr. to the Baroness Wenman; and Mr. Chapman, gr. to J. B. Glegg, Esq., had good examples of Gallande. The best Nectarines came from Mr. Tillyard, gr. to Lord Southampton, and Mr Chapman sent good fruit of the Elruge.

Finely ripened Circassian and May Duke Cherries, were communicated by Mr. Ingram, gr. to her Majesty at Frogmore, and Mr. Fleming, of Trentham,

Of Strawberries, Mr. Ingram sent large and beautiful British Queens.

Melons.—The first prize was awarded to Mr. Taylor, of Streatham, for a yellow, medium-sized, netted, green-fleshed fruit, named Golden Perfection. Mr. Fleming's Trentham Hybrid was the second best, and the third prize was given to a small green-fleshed kind, from Mr. Gadd. This latter, though perhaps hardly ripe, was very finely flavoured.

We noticed specimens of the Uvedale St. Germain Pear, unripe fruit of Stephanotis floribunda, ripe ditto of Passiflora pomifera; and Vanilla, Nutmeg, Gamboge, and Cactus fruit came from Mr. Ivison, gr. to the Duchess Dowager of Northumberland at Syon.

---

National Floricultural, *June* 12.—Mr. Beck in the chair. There was a good display of Seedling Pelargoniums on this occasion. A first-class certificate was awarded to Elise, a large flower, with pink under-petals, and white eye. Upper petals maroon, edged with delicate pink; a similar award was made to Ganymede, a distinct nice-looking flower with delicate pink under-petals, shaded with lilac. Upper petals dark, narrowly edged with lilac. Ditto, to Magnet, on account of its fine colour and profusion of bloom. The above came from Mr. Hoyle, of Reading. Mr. Beck, of Isleworth, received a certificate for Arethusa, a nice variety, with maroon top, very delicate salmon under-petals, and a light eye. Incomparable, from the same raiser, was commended for fine colour. Purple Standard, from Mr. Foster, of Clewer, received a certificate; and so did the same grower's Enchantress and Ariadne, both highly desirable sorts, more especially the latter. Mr. Ayres, of Blackheath, was awarded a first-class certificate for a Fancy Pelargonium, named Advancer, a well shaped very desirable flower; and certificates for Caliban, Miranda, and Gipsy Queen. These were pleasingly marked nice varieties.—Beauty of St. John's Wood, from Mr. E. G. Henderson, was commended for its colour; but in its present state it is too small. The same nurseryman's Queen of the Fancies was commended for fine form and general promising appearance.—Dr. Maclean had a seedling Pink, called Mrs. Maclean, which we hope to see again. Some Calceolarias were shown; but none were considered worth rewarding.—A shrubby yellow flowered bedding kind, from Messrs. Wood and Ingram, of Huntingdon, was very showy; but it was loose in habit.—Wellington Hero (bright yellow), from Mr. E. G. Henderson, was commended for bright colour.—Mr. Turner, of Slough, had the beautiful seedling Pansies, named National, Blanche, Swansdown, and Euphemia, and five Pelargoniums.—Messrs. Henderson sent a nice light Fuchsia.

## Miscellaneous.

*Sale of Orchids.*— An extensive collection of well grown plants, in pots, the property of a private gentleman who has given up their culture, was sold on Monday and Tuesday last by Mr. Stevens, at the following prices:—A fine specimen of Vanda Batemanni, 69*l.* 6*s.* (!); a smaller plant of the same kind, 13*l.*; Phalænopsis amabilis, from 14*l.* to 23*l.* 2*s.*; Cattleya Skinneri, 23*l.*; the orange variety of C. Mossiæ, 21*l.*; C. Mossiæ, 15*l.* 10*s.*;

C. labiata picta, 16*l.*; Epidendrum vitellinum majus, 21*l.*; Saccolabium guttatum, 19*l.* 10*s.*; S. præmorsum, 13*l.*; Aerides odoratum purpurascens, 21*l.*; maculosum, 13*l.* 10*s.*; A. affine rubrum, 13*l.*; A. quinquevulnerum, 11*l.*; Dendrobium Dalhousieanum, 12*l.* 12*s.*; Vanda violacea, 13*l.*; V. tricolor, 10*l.* 10*s.*; V. Roxburghi, 12*l.*; Angræcum caudatum, 7*l.* 7*s.* Other lots, of which there were in all 300, fetched from 1*l.* to 6*l.* per lot.

*Whitewash.*—Take 2 quarts of skimmed milk; 2 oz. of fresh-slaked lime; 2 lbs. of whiting; or the same proportions for any large quantity. Put the lime into a stone vessel, and pour upon it a sufficient quantity of milk to make a mixture resembling cream; then add the remainder of the material. When this is done, crumble and spread the whiting on the surface of the fluid, in which it will gradually sink. It must then be well stirred, or ground as any other paint. By the addition of any colouring matter, you make it suit your fancy. It must be put on with a paint brush, and, when dry, a second coat should be given. The quantity named is sufficient for 25 square yards. *Belfast Journal of the Chemico-Agricultural Society.*

*Heat of Plants.*—All living bodies have a temperature peculiar to themselves; that is to say, they have a temperature different from, and independent of, those that surround them. This temperature is intimately connected with their nature, and is modified according to the different conditions in which they may be. This necessary consequence of the successive changes which organic matter undergoes during life, is in its turn one of the causes which preserve organised bodies, and by which animal and vegetable life are protected from destruction or dissolution, which external circumstances would not be long in producing. It is this peculiar temperature which permits animals to inhabit regions of the globe that on account of their cold would be uninhabitable; which allows the development of aquatic vegetables in frozen water; which defends trees against winter, and which, in tropical regions, causes vegetables to withstand a temperature often too high for their organisation. The observations upon the elevated temperature in the flowers of Aroideous plants in general, have shown that this phenomenon takes place in a high degree, and originates in a sort of combustion, that is to say, an absorption of oxygen and emission of carbonic acid. Very recently a high degree of temperature has been observed in a plant belonging to a family in which that phenomenon has not been noticed before. Mr. Teysman, chief gardener at Buitenzorg (in Java) in 1845, has informed me that he has observed an elevated temperature, and at the same time a very strong smell, in the male cone of Cycas circinalis. I received from him, in October, 1849, and November, 1850, seven series of observations, made in the aforesaid garden, upon male flowers of this plant. What is most remarkable in these observations is connected with the following facts. The elevation of the temperature always takes place between 6—10 o'clock in the evening. Messrs. Bory (in the Isle of France) and Hasscarl (in Java) have observed the maximum at 6 in the morning. De Saussure observed it in the Arum Italicum between 4—7 in the evening; and the Colocasia odora in the gardens of Paris, Amsterdam, and Leyden has always attained its maximum at noon. This periodical production of heat, differing in different climates and in flowers of different families, has not yet been accounted for. It appears from the inspection of the tables of several hundreds of observations, that the maximum has varied between 9—14° C., and the difference has been 3·75—4·50°. It is acknowledged that in general the coloured parts among the appendicular organs in vegetables have an absorption and exhalation contrary to those of green parts. The oxygen is absorbed, carbonic acid is exhaled. Both take place in organs where the elevated temperature is shown in a high degree. It is proved that this phenomenon is constantly preceded and accompanied by rapid growth in the flower. Nothing prevents us from admitting that the same action actually takes place in the male cone of Cycas, where the rapid development of pollen, or the formation of cells which compose it, should surpass all that has been observed in this respect in the vegetable kingdom. We shall endeavour to prove it by the following calculation. The male cone, of which I have given the description elsewhere, is (in metres) 0·450 long, and 0·200 broad. The sum of the external surface is difficult to estimate, on account of the irregular form of the organ, but it cannot be considerable. In calculating the number of scales at 3500, and the surface of each of them at four square centimetres, the whole sum of the organs which compose the cone should be equal to 14,000 square centimetres. The surface of the scales at the underside is covered with unilocular anthers almost contiguous, and the number of these anthers may be calculated at 400. Thus the total number of these anthers might be calculated at 1,400,000. Each anther contains several thousands of granules of pollen, which in a very short space of time undergo, in their cavities, all the necessary organic, physical, and chemical changes. It is easy to admit that the alternate absorption and emission of gas, in so rapid a process, must have an important part. *Hooker's Journal of Botany.*

## Calendar of Operations.

*(For the ensuing week.)*

### PLANT DEPARTMENT.

MANY plants, such as early-forced Azaleas, which have occupied the houses up to the present period, may now with advantage be placed out of doors, in a sheltered and partially shaded situation. Cacti should be set out in a sunny place, which is better adapted to their succulent habit; and we find that their growth is more robust, and that they flower with greater freedom, from being placed in front of a south wall during the latter part of the summer, and watering them occasionally with weak liquid manure. Plants which are useful for autumn and winter flowering, such as Euphorbia, Eranthemum, Justicia, Vinca, Begonia, Gesnera, Gardenia, Franciscea, Jasminum, Aphelandra, Poinsettia, Torenia, Cactus truncatus, &c., should continue to receive every encouragement in the way of rich soil, liberal pot-room, and an adequate amount of heat and moisture, in order that they may form healthy, handsome specimens. It is well also to propagate some young plants of many of these kinds, as they will be useful for flowering in small pots this season, and may be grown on to make larger specimens for next. All free-growing plants should have weak manure water once or twice a week, according to the progress which the roots have made towards the sides of the pots.

### FLOWER GARDEN AND SHRUBBERIES.

Hyacinths, Tulips, and other bulbs, whose foliage is now fully matured, should be taken up, dried, cleaned, and stored in an airy room till autumn. It is a common practice to throw away the old bulbs which have been forced, or to stick them into some out-of-the-way border, and take no further notice of them; but they are well worthy of a greater share of attention. If, after being well ripened, they are taken out of the soil, carefully stored in a dry room during their season of rest, and in autumn replanted in beds of light rich soil, a healthy stock will be established in a few years, and from these the largest and soundest bulbs can annually be selected for forcing. Of the remainder, those which are large enough to flower at all may be planted in the flower garden, where they are highly ornamental during the spring months, and are at the same time preparing themselves for forcing in future years. Therefore let all the old bulbs you have in or out of ground, be taken care of till the planting season arrives. Hollyhocks, Dahlias, Delphiniums, Phloxes, and other herbaceous plants, must be neatly tied to good strong stakes; but this is very different to bundling them up in such a manner as to deprive them of light and air. The object of tying is to support the weight of the plants; but, at the same time, light and air should be freely admitted amongst the branches. In tying the Hollyhock, it is a common practice to bind up six or eight shoots to one stake, in which case the flowers are almost entirely concealed by the leaves. The proper way is to select a few of the strongest shoots of each plant, and tie them to separate stakes, placed sufficiently distant to admit light and air; so treated the flowers display themselves to advantage, and their appearance is truly noble. The Hollyhock looks particularly well when in groups; single stems have but a stiff and formal appearance.

### HARDY FRUIT GARDEN.

The shoots which are retained on wall fruit-trees will now require attention in nailing or tying, as the fruitfulness of the trees very much depends upon the shoots not being allowed to crowd or interfere one with another; and if their ornamental appearance, in an artistical point of view, is any object, the shoots should be laid in at proper angles while they are young. Continue pinching the points of Gooseberry and Currant shoots, and especially where they are blighted; it is a very quick way of destroying myriads of insects, while at the same time it forms a necessary part of the cultivation of the plant. Continue the exterminating process wherever insects make their appearance, as well upon the smaller bush fruits as upon the wall trees. The garden engine should be at work every night and morning upon these and the walls. Early Cherries particularly require this, as the black fly is making its appearance, and if not destroyed in time will soil the fruit as well as injure the leaves. Where common tiles have been adopted as a means of keeping Strawberry fruit clean, they should occasionally be turned up, by which a congregation of snails, beetles, and other injurious insects, will be exposed to view, and may be easily destroyed. The facility with which this may be done gives the tiles a great advantage over Grass or straw, as the latter materials harbour insects without affording the means of getting at them.

### KITCHEN GARDEN.

No crops after this time should be sown so thickly as to require much thinning, for in hot dry weather considerable injury is thereby done to the plants which are retained. Plants sown now for future transplanting should be much thinner than would have been thought necessary a month or six weeks back; this is to allow them a longer period to grow before they will need to be removed, and in order that they may then be carefully lifted with large balls of earth. Make regular sowings of Turnips and Spinach, and of Lettuces and other salads once in two or three weeks; sow a bed of Carrots and of Onions for using in a young state; and as small roots of Beet are generally preferred, a late crop of them should now be sown. A sowing should be made of the Vanack, Early Dwarf, or Sugar-loaf Cabbage, for late summer and autumn use; and of Knight's Protecting Broccoli, or some other good sort, for late spring use. Cardoons should now be transplanted from the frames or pots, choosing a moist or dull day for the purpose, and watering them afterwards in hot weather till they are thoroughly established. Let the leaves of Garlic be tied in knots or twisted, to check its growth, and assist thereby the development of the roots.

State of the Weather near London, for the week ending June 12, 1851, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 19th, 1846—therm. 93 deg.; and the lowest on the 15th, 1830—therm. 30 deg.

## Notices to Correspondents.

BALSAMS: *R B* says, that last year his Balsams were magnificent, every flower large and very double; he took particular care in saving the seed, which this year has produced nothing but worthless single blooms, not a double flower out of a hundred. He asks for an explanation from some Balsam grower, who perhaps will tell him whether Balsam seed is better or more likely to produce double flowers, if three or four years old?

BOOKS: *A Z.* Saunders's "Practical Treatise on the Culture of the Vine."‡

GREENHOUSE: *S C.* We never heard of a galvanised iron greenhouse, and have no knowledge of the cost of such a structure. It would certainly be a very bad sort of house, unfit for plants to live in.

GUTTA PERCHA: *A M C.* This is *not* an American production, but comes from the islands of the Indian Archipelago. Caoutchouc is produced by various trees in both the old and new worlds. We will examine the small bodies at leisure.

INSECTS: *A R.* We were unable to rear the insects sent by you last July. *W.—T F.* As well as we can judge from the shrivelled state of the specimen, the minute insect found in the bottle of filtered water is a very young larva of a Stratiomys, which is aquatic in its early stages. *W.—T C.* The insects found on the leaves of the Cucumber, which you have mistaken for spiders, are a species of garden mite (Acarus hortensis. See figure in our publication for the present year, March 22, p. 181, figure B). If repeated and careful fumigation in very close frames is not found to answer, try the plan of laying traps of dead leaves, which should be dipped from time to time in boiling water. *W.—A Subscriber.* The larva which has burrowed into the Birch shoot is a middle-sized caterpillar of the wood leopard moth (Zeuzera Æsculi. See *Gardeners' Chronicle* 1846, p. 236, for figures of its different states). *W.*

LABURNUMS: *Cytisus.* The production of purple and yellow flowers by the same Laburnum is confined to a plant called Cytisus Adami, an accidental garden "sport," concerning which you will find much discussion in former volumes of the *Gardeners' Chronicle*, but the true origin of which is uncertain. It is very common now-a-days.

MANURE: *Exeter.* Burnt oyster-shells have the same value and action as lime, and no more.

NAMES OF PLANTS: *G R.* 1, Epacris microphylla; 2, E. nivalis; 3, Acrophyllum venosum.—*F M.* 1, Phlox setacea; 2, Sedum Anacampseros; 3, Erica Bowieana.—*Sp.* Viola cornuta.—*Quercus.* The Rose-leaves are infested by Uredo Rosæ; the Mentha is incana of Sole, referred in systematic works to M. sylvestris as a well marked variety.—*J D A.* Umbelliferous plants cannot be named from their leaves; yours may or may not be Æthusa Cynapium; Kerria japonica; Carex cæspitosa.—*C Ml.* Masdevallia infracta; Oncidium ——.—*W T.* Clianthus puniceus, and Dodecatheon Meadia.—*E W, Bexley.* Raphanus Raphanistrum.—*A Subscriber.* Hermannia holosericea.—*G.* We will endeavour to ascertain.—A few inquiries stand over for further consideration.

PEACH TREES: *S S S.* Your Peach blossoms having all been destroyed, and the trees being young and over-vigorous, you may carefully root-prune next month. Dig out a trench and shorten some of the large roots to a lateral. In the meantime, check the over-luxuriant shoots by pinching, turning down their points; while weak branches should have every encouragement. If you can equally distribute the flow of sap, your trees will have but little occasion for root-pruning.‖

PEAR TREES: *A A.* We have received several communications concerning the appearances presented by your Pear leaves, and are unable to suggest their cause. Similar appearances have been remarked in other plants. The leaves look as if they had been struck by hail; but we believe there is no reason to suppose such to have been the origin. Perhaps some inquiries now instituted by us may lead to a solution of the enigma.

RUSTIC TEMPLES: *E M E.* You may see such things in the King's-road, Chelsea; and, we believe, in Hammersmith, not far from the Broadway.

TANE: *Hythe.* The cheapest and best material is slate; the next best is wood lined with lead. The latter is more unexpensive than the first, but not cheaper, because it will rot in time.

VINES: *R E C.* Your Vines are not mildewed at all. What you have done to them we cannot imagine.

WIREWORM: *J Abell.* Insert thick slices of Potatoes or Turnips in the beds, edgeways; examine them at intervals, and secure the depredators. You cannot be wrong in applying pickle and guano-water in moderation to Asparagus.‡

### SEEDLING FLOWERS.

PANSIES: *R R.* A large showy variety, dissimilar to any out, but rather coarse; colours rich. It might be sent out as a good second class flower.*

PELARGONIUMS: *F M.* As far as we can judge from a fewdetached petals, your flower is deficient in shape; the colours are good.*—*W R.* Smashed to pieces in coming through the post.*

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.
HENRY KER SEYMER, Esq., M.P., Chairman.
JOHN VILLIERS SHELLEY, Esq., Deputy Chairman.

Empowered by Act of Parliament to execute all works of drainage (including outfalls through adjoining estates), to erect farm buildings, and carry out every kind of permanent improvement upon estates under settlement; to provide the money, or to enable the landowner to employ his own capital and execute the works by his agents, and to secure repayment of the outlay by a charge on the property improved, spread over a number of years. Applications to be addressed to

Offices, 52, Parliament-street, London. W. CLIFFORD, Sec

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by Dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

ARTIFICIAL MANURES.—PRIVATE INSTRUCTIONS in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.

Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... | ...£11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

SHALE MANURE.—The Bituminous Shale Company can now supply Pulverised Shale Ashes in sacks at 2l. 10s. per ton, delivered at any station or branch line of the South-Western Railway, and at the Terminus, Nine Elms.

This valuable Manure is at once cheap, durable, and fertilising, and will be found to be superior to all others for Grain, Grass, and Root crops.

A singular property of this Manure is that it entirely prevents the ravages of the Fly in Turnips and Hops; it is also utterly destructive of the Wire worm.

Orders to be addressed to the Bituminous Shale Company, 145, Upper Thames-Street, London, where also testimonials from the first agriculturists of the day may be obtained.

ALGERNON POLLOCK, Secretary.

HOSE! HOSE!! HOSE!!! Improved Canvas-coated and Lined Gutta Percha Hose, for Liquid Manure, Fire Engines, Garden and Farm purposes.—This Hose is greatly improved, the rigidity of seam avoided, the flexibility increased, the waterpoof qualities extended, the prices more reasonable, and the pliancy that of a lady's glove. Much research and trial by the Manufacturers has enabled them to arrive at what they consider a perfect Hose. Improved Gutta Percha Hose Joints of all sizes.—Apply to Messrs. MITCHELL and Co., Agents, 98, High Holborn, London; International Depot for Patented and other Inventions.

HOSE FOR LIQUID MANURE, Fire-engines and agricultural purposes, made of canvass, lined and coated with gutta purcha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure, it is extensively used at the Government public works; also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abethaw Lime, and Roman Cement. Fine Black, 25l. per ton, and Rich Purple-brown, 20l. per ton.—Offices of the Company, 1, New Broad-st., London.—JOHN A. WEST, Secretary.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.
PATENT VULCANISED INDIA RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and) Manufacturer, Goswell-road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use; are particularly suitable for Fire Engines, and are found exceedingly useful in dwelling houses for conveying Hot or Cold Water to Baths, &c.

Testimonials and prices may be had on application to the Manufactory.

N.B. Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

All Orders or Letters addressed to J. L. HANCOCK, Goswell-mews, Goswell-road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boats, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

**The Agricultural Gazette.**
*SATURDAY, JUNE* 14, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, June 18—Agricultural Society of England.
THURSDAY, — 19—Agricultural Imp. Soc. of Ireland.
WEDNESDAY, — 25—Agricultural Society of England.
THURSDAY, — 26—Agricultural Imp. Soc. of Ireland.

EVERY owner of land who may desire to avail himself of the advantages of the Drainage Acts must join in the wish of our correspondent, "A Tenant for Life," that some accurate detail of the expenses of obtaining a Government loan should be furnished to the public by some one who has been the victim of the process he describes. It is certainly disheartening to be under the impression that what the Legislature intended as a boon has been so fettered by executive machinery as to make it a doubt at least whether it is worth accepting or not. But the subject is not without its difficulties, and an examination into those difficulties will show that some expense must be incidental to any system of administration that may be framed. We cannot, indeed, trace the legislative steps by which the obstacles arising out of our system of entail and the trammels of Chancery have been progressively overcome, and the power to charge a settled estate with the expense of permanent improvement conferred upon the tenant for life, without observing that much attention has been given to the subject by the most enlightened friends of agriculture, and that the expense which was found to be inseparable from every plan that could be thought of appeared to paralyse each successive effort that was made. The first Act, usually known as Mr. PUSEY's Act, by interposing the machinery of the Court of Chancery to protect the interests of remainder men, involved a delay and expense that rendered it wholly inoperative. The next Act founded on the laborious investigations of the Duke of RICHMOND's committee in 1845 swept away much of the form, and by dispensing with the attendance of counsel and solicitors, and the frequent reports of surveyors, struggled to cheapen the process down to the point of utility. But enough of the costly drowsiness of Chancery was still retained to make the measure unavailing, and only three or four applications appear ever to have been made under it. The jurisdiction was at last transferred to the Inclosure Commissioners by several public Acts, and every expense shaken off except such as in principle appear incidental and necessary to the subject. We say in principle, because it has never been doubted that a jealous protection of the inheritance is an inseparable appendage to the power of the tenant for life to charge upon it the amount of improvements which are set in motion upon his judgment; and as it cannot be said that the Inclosure Commissioners in interpreting the Drainage Acts have travelled beyond what their provisions require, the only question is whether protection to the estate can be any further interfered with, or any safe system conceived that shall be less expensive. It is clear the applicant must satisfy the authorities that he is a party comprehended within the Act, notice must be given by advertisements to all affected by the charge, their objections must be heard if raised, plans must be furnished of the lands to be drained, the mode of executing the drainage must be set out, the expense of it, and the value of the improvement shown, and, finally, inspection by a disinterested party must be made. No reversioner will be content with less than this; statesmen will startle if anything less is proposed, and how can all be done without delay and expense? The force of complaint has been directed against inspection; but it is difficult to see how any portion of what is now required can be given up. There is, perhaps, no subject on which greater difference of opinion has existed than on drainage, and the truth that half the drains in Great Britain will require to be relaid has passed into a proverb. A full plan of the drainage and a primary inspection are therefore absolutely necessary. The works being often left to the direction of a bailiff, or peradventure the village drainer, or what is sometimes more perilous still, the genius of the tenant for life himself (who is not always without temptations to complicity), the law is not severe which requires a final inspection of the work before money is advanced, which perhaps infants may be called to pay. These two inspections are all the present system demands, and if more than these become necessary, they must arise out of the exigence of the landowner that calls for instalments of the money as the works proceed, thus multiplying inspections to a like amount.

The real point of the difficulty then is, the impossibility to get the loan before the work is completed and the sanction of the Inclosure Commissioners obtained; or, as our correspondent truly observes, "the proprietor having to advance the money and perform the task before remuneration comes, strips the loan of half its value, it being mostly wanted to set the thing going." This is the true ground of complaint, and the rock on which the Duke of RICHMOND's last effort of the private advances (Drainage) Act has split. Money will not be advanced on works *to be* done, and where the security must depend upon the contingencies of obtaining the mortgage after the money is spent. The only practical form in which relief can come is by a *medium* which shall supply the money at the outset, and having the confidence of the proprietor and the commissioners, make the obtaining the sanction of the latter a certainty, while it eases the former of the expenses of a multitude of inspections, and the responsibility of getting the charge on the land. Such a medium would be of scarcely less value than the Drainage Act itself, and if this be the object of either of the companies which have lately come into existence, their parliamentary incorporation is very intelligible, and they may materially advance the interests of agriculture. The Inclosure Commissioners have cheerfully assisted proprietors in keeping expense at the minimum, and it may be well conceived that a company having their confidence may still further lessen what is necessary; and by also supplying the money required for the works, executing them where it is desired, and relieving the proprietor of all the trouble and responsibility of charging the estate, may make it more advantageous to resort to them than to encounter all the difficulties and uncertain expenses of a direct application to the Commissioners. At all events, it would be wise to investigate the expense of such a course, rather than be scared by the imaginary ills of "A Tenant for Life" from doing anything at all. It is said the existing Drainage Companies* comply with these conditions, and that the General Land Drainage and Improvement Company include within their powers equal provisions with respect to *farm buildings*. If they can, we propose, as a "rider" to our correspondent's suggestion, that this information would be of quite as much practical value as a detail of the expenses incidental to a Government loan. With present prices and present prospects, however, a stand-still policy can only lead to deeper difficulty. To make the most of the materials we have is the true wisdom, or as our correspondent will find in the next page of his favourite author—

> Men do their broken weapons rather use
> Than their bare hands."

## REPORT ON THE AGRICULTURAL SECTION OF THE GREAT EXHIBITION.

No. VI.—The next description of implements comes under "Division C. HARVESTING MACHINES." Among the edge tools of Sheffield, and other places, are to be found plenty of sickles, scythes, and hooks, for cutting Grass and corn, but very few are present in Class 9. We observed an invention of Boyd, Lower Thames-street, calculated to render the scythe an instrument of easier management. The most common form of scythe, with its wedges, and nails, and rings, and Grass-nail, is as different from what one might suppose it could be, as the Kentish turn-wrest, with its braces, and chains, and link nails, is from an improved iron plough. Various appliances have been tried, in order to simplify the setting of a scythe on its stick; but most of these have either not given it the necessary universality of movement, or increased its weight with metal. The present invention seems to answer the required ends. The blade is

* Their advertisements constantly appear in our columns.

fastened to the handle by two joints, by one of which its point may be set at any distance from the handle, and by the other at any distance above the ground, the blade being set by it either flat for mowing lawns, or turned upward for hay and corn. Each joint consists of two small round plates of metal pressed tightly together, in one joint by a screw, and in the other by an iron wedge. This double-action scythe has been patented. Machines for mowing and reaping by horse power have never fully established themselves in this country; they may answer where the crops are light and upstanding, but a piece of mechanism without discretion in a field of laid, weather-beaten, and thorough-grown Wheat, is as useless as a single barrel-organ for universal psalmody. However, many crops do stand up; and our English machinists, unwilling to be outdone by Americans and Australians, have from time to time devised engines for reaping them. There are several in the Exhibition, both models and working machines. One exhibited we believe by T. Fairless of Conbridge, near Hexham, Northumberland, consists of a square wooden framework upon four small wheels; carrying a vertical spindle in front, to which is attached a revolving horizontal frame with two large knives near the ground. As the carriage is pushed forward, these knives are carried round by means of wheel-work, and are followed by two rakes which turn up at a certain point of the revolution so as to leave the cut hay or corn in heaps. Garrett's reaping machine is evidently on a much better principle. The horses do not push but draw it along, walking close beside the standing crop. On the right side of the machine is a broad flat iron platform or receiver very near the ground; and the cutting part of the machine is fixed upon the front edge of this. The cutter consists of a number of triangular knives fixed upon a bar, so as to present a very coarse saw edge to the Grass or corn; and these sharp points are slided rapidly to and fro sideways through slits in a number of iron fingers or square prongs, the motion being derived by a crank rod and wheel work from one of the carriage wheels. A large breast, shaped like a mould-board, is fixed upon the platform, so as to turn the cut corn and leave it in a swathe in the track of the machine carriage.

As the resistance to the advance of the machine is all on the right-hand side of the line of draught, it might be expected that the whole carriage would swerve in that direction; but the inventor has prevented this by working the cutter from the near or left-hand wheel. The machine has not been tried in the corn field, but mows Lucerne well; and it is expected, with two horses, to cut any reasonably standing crop of white corn. The implement makers have succeeded much better in applying horse-power to hay making than hay cutting. Barrett, Exall, and Andrews' haymaking machine comprises most of the recent improvements. The bars holding the teeth are arranged upon two wheels on one main shaft, but having socket axles each turned by one of the carriage wheels. The main axle can be raised or lowered by wheels and spindles for the purpose, which is an excellent provision for different kinds of surface and different states of the hay. The tines are held either shut close or radiated open by springs, one to each wooden bar on which they are set. Smith and Co., of Stamford, Lincolnshire, exhibit their patent hay-making machine, which is perhaps the most superior of its class. This is also in two parts, with socket axles, and has two motions to be put in train for going either backward or forward. The teeth are held either in or out of work by springs; and the whole can be lowered or raised in or out of work by a crank and screw. One man can work it by himself, and has never occasion to leave the side of the horse, as he can instantaneously, and with the greatest ease, raise it from or lower it to its work, and quite as quickly and easily throw it in or out of gear, or reverse the action; thus effecting a great saving of time and labour, and lessening the liability of the workman to accident. It is calculated that the substitution of wrought for cast iron in this implement, besides increasing its strength and durability, decreases the weight on the horse's back by four stones, and lightens the draught. It obtained the prize at the Exeter meeting.

Among HORSE-RAKES we remarked one in which the tines are simultaneously lifted out of work by depressing the long bar upon which they hinge; another bar very near this, and underneath the tines, acting as a fulcrum over which their hinge ends are depressed and their point ends elevated. This action is effected by simply pulling down the end of a lever, which is held up, when the tines are in work, by a short lever and balance weight. There are many horse-rakes shown by different makers, some but little varying in the form of tine and leverage for lifting. Howard's prize rake performed its work exceedingly well at Exeter, raking clean when full, littering none, and being one of the best in hand. Smith and Co.'s patent "All-Iron Horse-rake," which has gained several prizes, is very simply worked; each tooth depends separately from the common axis, so that the whole set will readily adjust themselves to the inequalities of the land; and they are all raised at once by a bar passing beneath them. The action by which this bar is lifted, seems the perfection of such a movement; all the hand does is to pull down the end of a lever, and instead of this communicating motion to the bar by joints and levers and connecting rods, it does so by making one curve depress another, these being so formed as to give the greatest purchase just at first, and lift the tines very high and clear of the stubble or hay to be left behind. There are 27 teeth in the rake, covering a space of 7 feet. It is adapted for hay, corn, stubble, or Couch raking; and also as a light scarifier for Grass lands, for clearing off moss, &c., before top-dressing. Scarcely an ear of corn or a bent of hay can be picked up after it; it is easily cleared of its load while at work, without stopping the horses; is worked by one horse and a driver, and will not cost 1s. a year for repairs. *I. A. C.*

## SELECTION—THE TRUE SOURCE OF IMPROVEMENT.

By carefully following this principle, all our breeds of live stock have been brought to that degree of excellence which is the pride of the English farmer, the admiration of the British nation, and the envy of every other—horses, cattle, sheep, and pigs, sought after with insatiable avidity. Expense, don't name it; it is a favour to part with such animals. The decendants of a noble ancestry, and a copy of the family register, form a treasure of inestimable value to the fortunate possessor of them in another land; but, notwithstanding that England is supplying other countries with those breeds which I believe are destined to work a universal change in the live stock of the whole world, it is undeniable that she herself would be both richer and happier, if the best of each were to be found on every farm which divides her soil, and if a tittle of that intelligent care and assiduity which have been bestowed, in order to bring our choicest live stock to their present state, had been imitated by others. In reference to the vegetable kingdom, their labours would have long since been rewarded by the production of plants perfect in every respect—in early maturity, in quantity and quality of produce, the whole of the nutriment appropriated being converted into the most nutritious edible food, which that race is capable of producing, and none of it expended in useless waste; in hardiness and keeping habits, and for producing the most of the best animal produce, from these immaculate specimens of vegetable art. The attainment of this is alone wanted to place the English in the richest and happiest state which it is possible for any nation to acquire from the soil to which she owes her existence.

The present year, 1851, brings forth the Great Exhibition, the World's Fair, to which everybody is going, and where everything is expected to be seen, and the Royal Agricultural Society holds it annual show of live stock, in the Home Park, Windsor, to add to the attractions, and to exhibit to the scrutiny of the world, a show of animals, which no other land can congregate together—each from the muzzle to the tail a paragon of excellence.

But our agricultural vegetable productions—what of them? which of them can be said to approach perfection? None; not even a distant gleam of a worthy attempt being made to bring them to it, nor do we yet know which race is the best suited to the production of our object, in any one department of our business. Which root or bulb shall we choose, or would not something of the Cabbage tribe answer better?

Can it be that the Swede, for instance, is incapable of improvement; that it is of such a meagre habit as to refuse to adapt itself to that degree of plethora which is so much needed. If this be so, then I beg to take by the hand a sadly neglected root—a root which in quality as far surpasses the Swede, as the latter does those spongy pigmies which are even to this very day are allowed to encumber too much of England's soil—Kohl Rabi, its only fault being that when grown side by side with the former, it has not as yet with me produced quite so heavy a crop, but the quality of its produce makes it equally valuable per acre; and it is troublesome to top, but, it is still in an uncivilised state, leaves anywhere, everywhere, and nowhere; some roots crack, and form unsightly clefts, some run to seed-stems, and nearly all have a slight tendency to do so.

Cultivation and refinement will remedy the first, the second will sometimes happen; our best Apples will do so, and those which do are the best of them; but it would be better to grow our crop without this drawback, and I look to the same source to effect it. Remove with a small knife, the first appearance of a seed-stem, and the root will generally grow on unimpaired, but this is only quackery, it is attending to symptoms instead of rectifying the health; the cause is, seed raised in a faulty manner. I have seen a field of many acres taken in August, worked, and sown with Swedes, which arrived at the size of Bantam's eggs, and the following year was reaped, threshed, and carried to the seed-room. A crop of seed from such worthless, vagrant parents, to be distributed as being of a highly improved breed, and strongly recommended; but in reality, seed raised under the most unfavourable circumstances, sown out of season, allowed to ramble in filth, uncared for, surrounded and frequently overpowered by its most baneful enemies, weeds. Seed which has been associated with such company, never can produce plants capable of taking advantage, and turning to the best account, those expensive appliances which have emptied the farmer's purse, in the hope of obtaining the due reward of his exertions to attain perfect fertility.

It excites one's risibility to see the meagre subterfuges often resorted to, in order to explain the cause of a disgraceful crop of Roots—the fly,—the fly,—made all those blanks; wireworms cut the plants down;—we had bad weather! In nine cases out of ten, the plants, from debilitated seed, were unable to appropriate even the most favourable circumstances, and the deviation of a breath of wind in an adverse direction caused death; here opens upon us a whole multitude of voices, "Grow your own seed." Yes! but I much doubt if any of us know how it *ought* to be grown: for the best methods at present practised produce a proportion of seed which either never vegetates, or only to create disappointed hopes. In order to grow perfect Grapes, the gardener not only prunes and shortens back the Vine, and adjusts the number of bunches, but he thins out and regulates the size and quantity of Grapes (seeds) to each bunch, and until our agricultural seeds are grown after the same principle, our fields must ever be dotted with tokens of abortion.

Perhaps the Royal Agricultural Society may some day see the importance of the subject, and be enabled to send forth an essay on the "Growth of the Seeds of our Root Crops," and cuts to shew the proper quantity to remove from the top of the stem, and how to thin the side branches, so that every seed produced may be vigorous and healthy, requiring only to be placed in favourable circumstances, to shoot forth and hasten on to perfect maturity; and if we are to place any reliance upon our agricultural literature, the best of what good things we have were raised by accident.

What is wanted is the Kohl-Rabi bulb, having an early York Cabbage for its top, the attainment of which is not to be had, or expected, from the efforts of a few persons, but by enlisting the careful attention and long-continued assiduity of the many; and I hope that I have shown good cause for every person to do his best—that it may be done, is doubtless; and although the lucky finder may alone have his name borne by it, and planted over England's surface, still the individual exertions of each who tries are not the less commendable.

In conformity with the precept instilled into me, that "an acre or two of this, that, and the other kind *might* be useful, for fear one sort misses," I have waded through the whole mazy mass of our priced lists and catalogues, and have tried sundry Swedes, yellows, whites, purples, and reds, with a whole medley of tops and bottoms, flats and rounds, and all sorts of hybrids, heralded in with certificates which must have been well paid for, and the cost laid on the "selling price," and have arrived at the conclusion that I, like others, seemed to have no other object in view than studying a due admixture of colours, to improve the landscape. Experience has taught me that it is far preferable to have a selection of the best, and by good cultivation to obtain the greatest quantity of the best quality of those plants, which, for dairy purposes, are Cabbages, Carrots, and Kohl-Rabi. *T., April* 25.

## Home Correspondence.

*The Applicatian of Manures—Concentration or Distribution.*—I have never been able to reconcile with certain well established facts in the growth and nutrition of plants, the very general practice of concentrating manures immediately under the seeds of our root crops. This practice appears to be extending, for I perceive our implement makers are exerting their ingenuity to contrive implements for dropping the manure; and that it has been observed repeatedly, in print, that drilling the manure is wasteful; as if that deposited between plant and plant was useless. I nevertheless adopted the practice, because, as a general rule, I think it the safer course to adopt any practice that has been in favour with the best agriculturists, rather than follow out theoretical views, however apparently well founded. Having, however, recently attended a lecture of Professor Way's, delivered at a meeting of the members of the Royal Agricultural Society, at which he entered on this subject, incidentally, in his discourse on the preparation of superphosphate of lime; and his observations having been in exact accordance with the views I had previously entertained, I am induced to recommend my brother farmers who adopt the principle of concentration, to re consider this matter. I have a strong impression the current is running in the wrong direction, and that, on the contrary, we should be seeking the means of the most minute division and extreme distribution. The facts to which I have referred, and which, to say the least of them, demand careful consideration, are that roots absorb their nourishment only at their terminal points; that these extend in all directions; and as the plant increases above ground, so do the roots increase their ramifications beneath the surface, and demand a continual supply of food. I am aware it will be replied, this process is in search of food, which will be unnecessary if this be supplied ready at hand. But is this consistent with their mode of feeding, and the conditions under which their nutrition is practically effected? It is well known they cannot feed on solids, and that they receive their nourishment only in a liquid or gaseous state; that this conversion is very gradually effected through the agency of the atmosphere or water, and consequently that it is readily accomplished in proportion to the minute division of the manure subjected to those influences. Again, just as the first delicate roots are emitted, is not the time at which they require a concentrated supply of the richest food; but their appetites and their powers of assimilation grow with their growth, and, as they increase, they require a larger supply in all directions, and that ready prepared by gradual solution and decomposition. Entertaining these views, I was much pleased to see, some time ago, a prize offered by the Royal Agricultural Society for the best manure distributor as a step in the right direction; and I cannot but think the implement makers will be more usefully employed in contriving means for minute division, and thorough and equal distribution of manures, than for their concentration. I hope your readers may have the benefit of a report of Mr. Way's very judicious observations on this subject, as they are entitled to consideration. I

has been frequent matter of discussion, whether it is the better plan to lay on the manure in the autumn, and plough it in before winter, or to do this before spring sowing. The foregoing considerations would lead to the adoption of autumnal manuring, immediately followed and covered by the plough, by which means the manure would be thoroughly incorporated with the soil during the three or four months they would be intermixed. The main objection to that system was heretofore considered to be that the fertilising elements of the manure were, in a great measure, lost by the washing of the winter rains. The observations, however, made of late years, on the absorbent powers of all soils, except those composed mainly of sand, and which have been recently demonstrated by the highly important and interesting experiments of Professor Way, have clearly established the fact that the soil has the peculiar property of absorbing and appropriating all those elements of manures intermixed with it which are essential to the growth of plants—the most valuable discovery perhaps, in its results, for which agriculture has been indebted to science. *Chas. Lawrence.*

*Deep Draining.*—Permit me to reply to the inquiries made of me by "An Inquirer." I observe, however, I should much rather have done so, if he had favoured me with his address, and which, I think, he ought to have done; I conclude that when one "voluntary" correspondent addresses another, whether privately or through a public journal, like your's, he ought to give his name and address; that is, if he would expect a careful and courteous reply. But "An Inquirer" writes, that he occupies "land of all degrees of stiffness; some very stiff, some a jointy, brashy, mixed kind; and some half clay, half sand, or at least partaking of the character of the two." "I am hurt," he continues, "by the water from the clouds, which does not get readily off." He then goes on to state further, that drains cut just out of the reach of the ploughshare, or the poaching of a horse's hoof, would surely catch it (the water) sooner than a drain from 3 to 5 feet deep; and, in addition to this, he adds, how is it to get so low through a stiff subsoil in time to do me good? &c. &c. On reading this account, I at first thought "An Inquirer" was quizzing me; but whether he be so or not, I will endeavour to reply to his inquiries; and as he asks me to be brief, I will endeavour, also, to satisfy him in this respect. I lay it down, therefore, as a truth not to be refuted, that no fertiliser that can be put upon any kind of land is equal in value to "water from the clouds;" and also, as another truth, that this water cannot be permitted to run off land, or through such drains as "An Inquirer" advocates, without continually deteriorating the value of the land. I likewise inform "An Inquirer," and all others who think and act as he professes to do, that on no account whatever should he or they put such drains as he advocates into any land of mine; or were he or they to do so, I should consider that they had greatly injured my property; and as, in so acting, they would oppose my will, I should perhaps bring an action against them for damages. But I will give an example in point. A tenant drained some land, the landlord finding tiles; the tiles were to have been put in at least 4 feet deep, but the tenant was of the school of "An Inquirer," and so he put them in at about half that depth. The land continued cold and wet, and water stood upon it in many places; and the drains were worthless, or worse than worthless. Upon which the landlord and tenant quarrelled, and the former took the land into his own occupation, and re-drained the land with pipes at a depth of 5 feet, or more. I saw the land under both kinds of draining, and the landlord's drains, though on an average full 3 feet deeper than the tenant's, rendered the latter altogether useless. I saw the deep drains pouring out their water into a deep ditch, whilst the shallow drains were perfectly dry. After that the landlord went to the expense of taking up all the tenant's tiles, and which were lying in large heaps at the corners of the fields when I last went over the farm. The land is now at all times, as the proprietor informed me, and as I myself have witnessed, as dry and in as fine a state for cultivation as a well cultivated garden. And such is the state of my own land; the deepest drains always run the first after a long drought. At this time I am now writing, one drain only is running, and that in some places is at least 7 feet deep, and the water is as pure and clear as water can be. But let me draw attention to another fact, and as worthy of serious reflection. Let us suppose an undrained field to have open furrows at stated intervals; as I have before stated, at every shower of rain water holding in solution the essence of the manure put on the land, and the sand so valuable to all heavy lands, are washed out and carried, first down those furrows, and thence into ditches, and at length into rivers, and thence to the sea. But let us suppose again, that "An Inquirer" should put his pipes or tiles into that land just "*below the poaching of the horses' hoofs*," and the effect would be nearly the same—a thick muddy liquor would issue from those drains, again deteriorating the land, and carrying away with it, as before, the essence of the manure; but let drains 5 feet deep be made in the same land, and the open furrows and shallow drains would be rendered useless, and all the water would issue from those deep drains as clear as crystal. If "An Inquirer," or any person of his chool, of which I am aware there are very many, try the experiment on some cold, wet, stiff, clayey land, and he or they will soon find that all I have stated is perfectly correct. But, Mr. Editor, these are not half the advantages resulting from thorough draining, but I reserve stating more until I have again heard from "An Inquirer." *G. Wilkins.*

*The Equinoxes.*—These, as is pretty generally known, occur twice in the year; but the influences they exert upon the weather of the succeeding half year does not appear to excite sufficient attention. The vernal equinox of the present year took place at 56 minutes past 4 in the morning of March 21st, the wind being then South-West by South—very lively—temperature about 42° Fahr., weather pretty fine at the time. The barometer, then low (several degrees below the usual mark of "changeable,") continued to fall steadily, till it marked 28.77 inches on the evening of the 22d. On the corresponding days of the last year (1850), the mercury stood at 30.13 and 30.20 inches, the whole of the preceding period, from the 4th of March having witnessed its extraordinary altitude—above 30 inches ("Fair")—amounting to 30.52 inches, as the maximum. Without venturing to prognosticate, it may safely be asserted that the meteorology of equinoctial periods affords tolerably correct indications of the intervening seasons. Now, therefore, as the wind in several instances, blew forcibly from some point, to the South, accompanied with profuse rain, from the 17th to the 26th, including, of course, the precise moment when the sun entered the spring sign of Aries—at the intersection of the two great horizontal circles—no doubt can exist that a thoroughly wet and boisterous equinox has been established. The writer was first induced to observe the equinoctial periods, in the year 1822, when the clergyman of St. Peter's, Isle of Thanet, told him that he knew an aged man who, during the course of 60 years, had rarely failed thereby to obtain a correct indication of any ensuing summer or winter. The Irish meteorologist, Kirwan, had stated, long ago, to the effect that "If there be a storm at South-West or W.S.W. on the 19th or 22d of March, the succeeding summer is generally wet, five times in six. Since 1822—a fine and fruitful year—many cases in point might be cited. Thus the March of 1828 was dry and serene till the 18th; the barometer at an average of 30 inches, but West and South-West winds prevailed. The mercury fell rapidly, cumulo-cirro-stratus clouds formed, and a South-West gale succeeded; the summer everywhere wet. The equinoxes of 1829 and 1830 indicated, and were followed by a rainy and changeable summer. On the contrary, those of 1831, 1832, 1834, and 1835, predicted fine summers; and the results corresponded." (See "Naturalists' Calendar," of March; "Domestic Gardeners' Manual.") Subsequently the summers of 1841, 1843, 1845, and 1848 were wet; and whoever can see the "Edinburgh Quarterly Journal" of March instant, will find a notice of the two equinoxes of last year, and of their results in the article "Characteristics of 1850." Experience has proved that an equinox may exercise, at the very hour of its occurrence, a changing influence. As a general rule, however, the prevailing weather, be that changeable and fickle, fine and dry, or wet and windy, must be taken as the index. The one just past is decisively adverse, more so than any other that can be called to mind since 1828-29. We therefore are warned by experience to anticipate a very rainy and unpropitious harvest. *Veritas.*

*On the Culture of Chicory.*—Chicory has been long cultivated in Italy on a large scale, and esteemed, either green or dry, as an excellent fodder for horses, cattle, and sheep. In France it has produced large crops; and found its way into England in 1788, by the enthusiastic recommendation of Mr. Arthur Young. The moist atmosphere of our island is less favourable to its being made into hay. In Lombardy it is sown, mixed with other herbs of pasture, and cut 3 or 4 feet high. It is reputed there to increase both the milk and flesh of cattle, and to be very nutritious when made into hay. Horses eat it greedily, and it is freely eaten by sheep, and it is very valuable as a green food for soiling. The growth is early, and defies drought, and the large spreading leaves retain moisture by covering the ground. The stalks are thick and stiff, and withstand the storms of wind and rain. The most severe colds do not injure it. The earliness of the produce affords an abundant food when other articles are scarce; and the growth is more rapid than Burnet, Lucerne, or Sainfoin. Two cuttings may be made of it the first year, and three or four, according to the season, every year after—in May, July, and October—never letting it become hard or sticky; or it may be cut continually, by beginning again when the whole piece is gone over, and thus afford a constant supply of fresh food during seven or eight months. The produce is said to exceed that of Lucerne as three to one, and the average produce of four years was nearly 30 tons. The partiality with which novelties are commonly viewed was not of long continuance in the case of Chicory. Some accurate experiments were made in France, at the national farm of Rambouillet, to ascertain the value of Chicory, compared with Lucerne, and other green food. The Chicory was declared inferior, giving a disagreeable taste to milk and butter, when cows are kept upon it. For sheep it is very good, and a small portion mixed with their other food, may probably be a preservative against the rot. The value of the plant has sunk to the quality of the root, as a medicine, or an infusion. Chicory is now chiefly cultivated in Germany and Belgium, for the purpose of preparing from the root a powder, which can be substituted for coffee. This has become a very considerable article of commerce. It was very lately introduced into Britain, and the consumption of it, and consequent demand, increased so rapidly, that the Government thought proper to put a check on its importation, by a duty of 20*l.* per ton on the dried root. Chicory requires a good soil of warm deep loam, clear of weeds, and well-rotted manure laid on a stubble in the end of autumn, and ploughed under with a deep furrow. In the spring, the grubber, driven lengthwise and crosswise, prepares the land for being sown with the seed in May, by the coulters of a machine which makes ruts for the reception and covering of the seed. When risen to the height of 2 or 3 inches, the plants are thinned out to 6 inches in the rows, and most carefully weeded. The intervals of the rows are scarified by a three-toed scuffler. In September, the plants are gathered, and the roots taken up, which may be done with a common Potato fork; they are then cleaned by scraping and washing. Split where they are thickest, and cut across in pieces about 2 or 3 inches long. These pieces are dried by means of a slow oven or a kiln. Some nicety is required in drying, to prevent the root from being scorched, and to keep the proper flavour. In this state it is sold to the merchants, packed in bags. It is afterwards cut or chopped into small pieces, and roasted exactly as coffee, ground in a mill, and packed in papers, in pounds and half pounds, for retail sale. When coffee, as well as all colonial produce, became too dear for the labouring classes in France and Germany, Chicory was almost universally used as the best substitute, and the taste is by many thought so grateful, that they prefer the coffee with which a fourth or a fifth part of Chicory has been mixed. Chicory is said to exhaust the soil, and to require fresh ground, to prevent its degenerating. Unless the soil is rich and light, the roots will not come to a good size in one season, and old roots become tough and stringy. It is only the young roots that are fit to be prepared for commerce. They lose a great portion of their weight in drying. The best preparation of the land for Chicory is Grass or Clover, or a very clean stubble. The manure laid on the ground in autumn, as before directed, will be decomposed during winter along with the roots of the stubble or Grass, and a deep furrow in the spring will lay the land light, and raise a depth of mould. The surface is then harrowed fine, and the seed deposited in rows of 12 inches apart and rolled. Liquid manure spread over the ground will much accelerate the growth of the plants, which must be thinned out, like Turnips or Carrots, to 6 or 8 inches from plant to plant. The leaves and roots of Chicory have always been, and are yet, held to be medicinal, though the plant has not obtained a place in the Pharmacopœia. The virtues depend on its milky juice, which is of a penetrating, bitterish taste, but of no remarkable smell, or particular flavour; the roots are bitterer than the leaves or stalks, and these much more so than the flowers. The roots and leaves have been stated to be very useful aperients, acting mildly and without irritation. The inferiority has been fully established of Chicory as a green food in comparison with Lucerne—as a root, it sinks far below Mangold Wurzel; and for hay, or a dried state, the succulent leaves are very unsuitable, as the juice evaporates, and leaves a shrivelled, tasteless fibre. In Britain, the culture can only be done on the soils and under the climate that suit the Parsnip and the Carrot, and it even requires more favourable circumstances than the latter plant. For agricultural purposes, the produce is inferior to either of the above-mentioned esculents, and the only value consists in the powdered roots being mixed with coffee. *J. D.*

## Societies.

### ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

(*Continued from p.* 365.)

A Lecture, on the agricultural employment of common salt, was delivered before the Members, at a Weekly Council, held at the Society's House, in Hanover-square, on Wednesday, May 14 (the Hon. Robert Henry Clive, M.P., Trustee, in the chair) by Professor Way, the consulting chemist to the Society.

Professor Simonds, the Veterinary Inspector to the Society, then made a few observations, at the request of Professor Way, on the Action of Salt on the Animal Economy. He was not then prepared to enter fully on the subject; but he might remark, as a general rule, that although different conclusions had been drawn from the use of salt, according to the amount and under the circumstances it had been supplied, it was exceedingly beneficial in moderate quantities, but prejudicial in large ones, as a condiment for the food of animals. He was aware that it had been considered by some persons to be injurious, in producing abortion in ewes and cows. His experience, however, had not led him to such an opinion; for even when large quantities of salt had been given to animals, he had not found that it exerted any specific action on the uterine system, such as that which the ergot of many Grasses was so well known to exert both violently and deleteriously on those organs. He thought undue quantity of food and plethora the more probable cause of abortion. It was difficult to fix the limit in which salt should be given to animals. Prof. Way had placed in his hands a tabular statement of the amount of common salt contained in various kinds of herbage, from which he had been enabled to estimate the amount of that substance constantly taken into the stomachs of grazing cattle along with their ordinary food. He showed that cart horses, feeding on meadow hay, Bean-meal, and bran, took in a considerable daily proportion of salt; that in other cases the hay was salted; and that the free use of rock-salt was common on a farm: while the animals thus receiving these supplies of salt were not only uninjured by its use, but absolutely benefited in their health, gaining vigour and strength. Sheep fed on Clover-hay and Turnips would

not receive so large a proportion of saline matter, and might therefore have more salt given to them in addition to their food. Horses might take with advantage from an ounce and a-half to two ounces of salt daily: but an excess of it, no doubt, would render animals weak, debilitated, and unfit for exertion. Similar facts were applicable also to oxen, which accumulated flesh faster by the judicious use of salt than without it. Arthur Young, in his examination before a committee of the House of Commons, in 1818, had stated that he found salt prevent the rot in sheep; and Sir John Sinclair and many others had given evidence to the same effect. Prof. Simonds then alluded to the solubility of common salt, and its passage into the stomach and intestinal canal; its absorption into the system by the veins, its action on the liver, and the supply of soda it yielded to the bile: thus leading to a greater amount of nutriment being derived from the food. Sheep living on pastures giving them the rot were found to recover when they had access to salt; and he thought the probable cause of sheep not rotting on salt marshes, and recovering when put on them, was the healthy stimulus thus communicated by the salt to the liver of the animals, by which that organ was guarded from disease, and its functions invigorated. Salt, too, was well known as a vermifuge, destroying many kinds of worms in the intestines of animals, and conferring a healthy tone of action which prevented their re-occurrence. He then alluded to the prophylactic, or preservative influence of saline impregnation against marsh exhalations, and its power of destroying the poison of those miasmata, as shown by Dr. Stevens in his work on the blood, where reference is made to the fact, that at Salina, in Genessee county, near Oneida Lake, in the state of New York, all the individuals in and about some salt works, situate in the midst of a marshy district, escaped from the attacts of marsh fever, while the population around them suffered.—Colonel Challoner's attention was called to the value of salt about fifteen years ago, by the late Earl Spencer; and since that time he had invariably used it for his cattle, which in consequence had attained to a better condition of flesh than they had done when no salt was given to them. His Devons were the best cattle on his farm, and they consumed the largest quantity of that substance.—Mr. Fisher Hobbs had little more to state on that occasion than he had stated when the subject was discussed by the Council a few months previously. He agreed with Colonel Challoner, that those of his animals which had the most salt did best, and even pined after it when it was withheld from them. He did not consider that it acted simply as a manure on grain crops; but it stiffened and brightened the straw, and caused it to ripen from two to five days earlier than it would otherwise have done. In the case of root-crops it was more beneficial to Mangold Wurzel than to Turnips; and in fact, that great caution was required in its application to the Turnip plant, which was easily injured by injudicious use, on account of its great effect on the vitality of that plant. It increased the size of the Mangold bulbs, and caused the plant to retain its fertilizing character during dry seasons. He applied the pilchard-fishery salt broadcast on each side of the plants in July, either alone (in particular seasons) or mixed with ashes or guano (which improved it), and then scarifying it in. The frost had less effect on the salted than on the unsalted portions of his land; and by its means light soil becomes more retentive of moisture, and more adherent and compact in its character. His land was variable, consisting principally of sand, gravel, and mixed soil. The fishery salt he employed was nearly of the same price as the ordinary salt of commerce, and it contained oil and animal matter derived from the fish. The wireworm died in it. In conclusion, he considered salt to be very beneficial to the soil, either alone or in a state of mixture with other substances.—The Rev. A. Huxtable was rather leaving off salt. Those of his sheep which had the most of that substance were the least improved in their weight; in fact, one ewe, very fond of salt, had become a mere skeleton from taking it in excess. He found that his animals were much purged by the use of salt. His milch cows, however, requiring more flesh than fat, were much benefited by it. Roots were much used by him, and he continued the use of salt with great effect as a manure for their growth; indeed, in this respect, he could not do without it, especially in the case of his Mangolds and Carrots, for the latter of which, being a sweet root, of which all insects were fond, it acted as a shield against depredation for these crops. He drilled it in with ashes and urine. He mixed a saturated solution of salt with dissolved bones, and found it produce a more pasty and decomposed substance. His soils were gravel, clay, and chalk.—Mr. Fisher Hobbs thought it probable that the circumstance of Mr. Huxtable's sheep being tied up when the salt was given to them, was the cause of the purging; for he had known it to be the common practice in Leicestershire some years ago, when the sheep had a purging upon them, to get them into a fold, and give each of them half a handful of salt as soon as the diarrhœa made its appearance. This practice he had himself usually adopted with success, and he believed it to be common amongst flockmasters.—The Chairman, when travelling abroad, had noticed in the middle of hotel yards, where relays took place, a large block of salt, to which the post-horses had free access. He considered that horses in full work derived an advantage, more or less, according to circumstances, from this substance. With regard to its effect on vegetation a curious result had occurred in Cheshire, where the Marquis of Westminster had applied salt liberally on a road four miles long, for the purpose of destroying the weeds on it; but it was found that the weeds, instead of being destroyed by this application, were more numerous than ever.—Mr. Barrow had found salt improve the strength and quality of his Wheat straw, his neighbour's crops having been laid while his stood well. He had entirely destroyed fine rows of box in his garden by applying salt on his gravel-walks for the purpose of killing the weeds.—Mr. Parkins had not had a weed on his gravel-walks for five years, by forming them on a bed or substratum of chalk mixed with coal-gas tar sifted over gravel, and allowed to set; lime being used when a more compact substratum (capable of bearing the pressure of a loaded cart wheel without yielding) was required.—Mr. Mechi had used 150 tons of salt on 170 acres of land during five years' occupation, He found it essentially necessary for cattle and horses, when fed on Wheat straw cut into chaff with Bean-meal. If salt were not given, their coats appeared rough and unhealthy; but with salt they were sleek and healthy. His sheep and pigs also had salt. Horses and cattle received two ounces daily, yearling calves one ounce. Without being able to give the scientific reason, salt gave strength and brightness to the Wheat straw, and prevented its lodging. He applied it at the rate of 3 cwt. per acre, mixed with the same weight of guano. He also used a large quantity under the animals, to fix the ammonia in their manure, which it did far more effectually than gypsum. He had known of great advantage from mixing it in the dunghill. It was very beneficial to Mangold Wurzel. It certainly, with all deference to Mr. Way, appeared to render the land more wet and adhesive. He thought it would not be so beneficial on undrained heavy lands. Early on a hot summer's morning he had observed the grains of salt formed a wet spot, as though they had attracted moisture from the dews.—Prof. Way explained that common salt might be a better fixer of ammonia than gypsum, on account of its greater solubility. Salt, from any deliquescence it occasioned, might affect land in regard to colour and resistance to the action of frost; but moisture was not the simple cause of the good effects of salt.—Mr. Dyer instanced the deliquescent effect of salt in bacon-salting rooms, where the pavement was constantly damp. He had even known milk spilt on deal boards years ago, which now, in damp weather, always attracted moisture where the milk had been originally absorbed.—Mr. Fisher Hobbs referred to the power of the fishery salt to fix ammonia, and used it frequently with guano with a view to that object.—Baron Mertens expressed to the Council his thanks for the kind manner in which they had acceded to his request, on the part of the Belgian Government, that this subject should receive their attention and give rise to practical discussion. He would only further trespass on their time by enquiring whether any experiments had been made to ascertain the increase in the weight of milch cows, and of the milk they yielded, in consequence of the use of salt as part of their food?—The Rev. A. Huxtable, having a dairy of 40 milch cows, had found it difficult to make experiments on that express point; but Boussingault had last year given an account of experiments similar in their object to those which were now the subject of Baron Merten's enquiry.—On the motion of Colonel Challoner, seconded by Lord Bridport, the thanks of the Council were given to Professor Way and Professor Simonds, for the favour of the statements they had on that occasion made to the members, on a subject interesting and important in itself, but dependent on various circumstances of condition, and a clear elucidation of scientific principles, for its correct comprehension and practical application.—Mr. Raymond Barker expressed a hope that the learned Professors would kindly consent to deliver these short introductory lectures more frequently to the members at the weekly sittings of the Council; a request to which Professors Way and Simonds expressed their willing assent.

---

A WEEKLY COUNCIL was held at the Society's House, in Hanover-square, on Wednesday, the 21st of May: present, the Hon. ROBERT HENRY CLIVE, M.P., Trustee, in the chair, Lord Bridport, Sir Charles Lemon, Bart., M.P., Mr. Arkwright (Hampton), Mr. Arkwright (Sutton), Mr. Raymond Barker, Mr. D. Burton, jun., Colonel Challoner, Mr. Clavering, Mr. Cosens (Langdon), Mr. Dunn, jun., Mr. Hudson (Castleacre), Mr. Maddison, Mr. Pendarves, M.P., Professor Sewell, Mr. Smith (Exmoor), and Mr. George Wilbraham.

DRAINING.—MR. ARKWRIGHT, of Sutton Hall, Derbyshire, favoured the Council with a statement of the successful manner in which he was improving his estate in that neighbourhood, consisting chiefly of strong clay with very little soil upon it, by means of consecutive draining, carried on by degrees, and according to circumstances, over such portions of the land as were found to require it. He also submitted to their inspection the draining-book of this property, in which a plan of each field was given, and lines indicating the gradual process in which the drainage had from time to time been effected, either over the whole extent of any particular field or partially as circumstances might have required.—Colonel Challoner agreed with Mr. Arkwright, that principles might be laid down for draining, but no rule for a general case.—Mr. Hudson, of Castleacre, had about three months previously visited Sir John Boileau, Bart., at Ketteringham, in Norfolk, for the purpose of inspecting the underdraining of the Potash Farm, in that county, which had been executed under the superintendance of Mr. Fulton. This was the best piece of draining Mr. Hudson had ever seen. In walking over the farm he ventured to suggest to Sir John Boileau, that the bottom draws of clay, which were found to be full of chalk, should be spread on the surface, instead of being put into the drains; by that means, a saving of from 400*l.* to 500*l.* would be effected, as there would be about 60 yards of good clay put on the land at an expence of two or three shillings per acre, which if carted on would cost from 30*s.* to 40*s.* per acre, besides the injury that would be done to the land, by carting the clay over it.—Mr. Hewetson, of Down, near Farnborough, transmitted for the inspection of the Council some wooden models of draining tiles made "for the purpose of uniting the small and main drain where an additional fall can be obtained equal to the depth of the larger tile, on the top of which the bottom of the smaller tile rests, fitting securely in its place: the opening in the top of the large tile and the rim at the bottom of the small one being both circular, and thus allowing the drains to unite at an angle." An interesting discussion then ensued on the arrangement of drains in land, their stoppage in sandy soil, the shape and size of tiles, and mode of adjusting them, the filling-in of drains by Clayton's Drain-consolidator, and other details of practical experience, in which the Chairman, Mr. Arkwright, Col. Challoner, Mr. Hudson, Mr. Wilbraham, Mr. Cozens, and Mr. Smith, of Exmoor, took part.

AUSTRALIAN GUANO.—Mr. Manning, of 251, High Holborn, transmitted to the Council a bag of guano received from Egg Island, one of a group of islands lying off and about Shark's Bay, the most western point of New Holland, in south latitude 25°, and east longitude 113°. Mr. Manning stated that there were several other adjacent islands covered more or less with guano, of a quality supposed to be in some instances superior to that on Egg Island. Rain, he said, scarcely ever fell on those islands, and in some places the guano was found many feet deep. Mr. Manning concluded his statement by a detail of the steps that had been taken to bring about this first importation of Australian guano; and accompanied it by a hope that the Council would consider the subject of sufficient importance to request Professor Way, the consulting chemist of the Society, to make an official analysis and report on the value of the guano in question. The Council acceded to this request, and directed the sample to be passed over to Professor Way accordingly.

MISCELL. COMMUNICATIONS.—Mr. Murcott sent specimens of an insect believed by him to be the cause of the failure in the Clover plant, which the Council referred for microscopical examination to Prof. Simonds, and in reference to its agricultural bearings to Mr. Lawes. Colonel Le Couteur presented a sample of cured Jersey butter, about a year old, which was found to retain its fine qualities and fresh taste in a remarkable degree. A letter was received from M. Maurencq, the President of the French Agricultural Commission, and referred to the Monthly Council. Mr. Arkwright favoured the Council by explaining to them the advantages of a cottage stove he had found of great simplicity, economy, and capable of affording great comfort and convenience to labourers.—Mr. Hudson, of Castleacre, stated the injury done to seed-corn by mixing guano with it before sowing.—A French essay on butter-making was received, and referred for consideration to a future meeting.

---

PROFESSOR WAY favoured the members, on the 28th of May, with a Lecture on the Preparation, Composition, and Agricultural Employment of Superphosphate of Lime, for which he received the thanks of the meeting. The chair was occupied by His Grace the Duke of Richmond, K.G., President of the Society, who introduced to the Council, on that occasion, M. Maurencq, Baron de Montreuil, and the other members of the French agricultural commission.

---

A MONTHLY COUNCIL was held at the Society's House, in Hanover-square, on Wednesday, the 4th of June: present, the EARL of DUCIE, V.P., in the chair, Sir John V. B. Johnstone, Bart., M.P., Sir Montague Cholmeley, Bart., M.P., Mr. Alcock, M.P., Mr. Thos. Raymond Barker, Mr. John Raymond Barker, Mr. Barnett, Mr. Beasley, Mr. Blanshard, Mr. Bramston, M.P., Mr. W. G. Cavendish, M.P., Mr. Garrett, Mr. Brandreth Gibbs, Mr. Grantham, Mr. Fisher Hobbs, Mr. Jonas, Mr. Kinder, Mr. Lawes, Mr. Milward, Mr. Pendarves, M.P., Prof. Sewell, Mr. Shaw (London), Mr. Sillifant, Prof. Simonds, Mr. Stansfield, M.P., Prof. Way, Mr. Jonas Webb, and Mr. Wilson.

The Hon. Captain Rushout, M.P. (2d Life Guards), of Burford, in the county of Salop, was elected a governor of the Society.

The following new members were elected:—

Kennedy, Primrose William, Drumellan, by Glasgow
Bolitho, William, jun., Penzance, Cornwall
Stowey, Augustus, Kenbury House, Exeter
Guthrie, John, Guthrie Castle, Forfarshire
Webster, P. C. Gillies, Ashfurlong House, Sutton-Coldfield
Tredwell, S., Highfield House, Leek, Staffordshire
Loder, Robert, The Beeches, Slaugham, Sussex
May, Geo. Andrew, Elford Park, Lichfield, Staffordshire
Tuley, Joseph, Matchless House, Keighley, Yorkshire
Botham, William Hallam, Salt Hill, Slough, Bucks
Weatherley, James, Swinhoe, Alnwick, Northumberland
Blashfield, J. M., New London-street, Mark-lane, London
Gladman, William, Mount Pleasant, Bolney, Sussex
Postlethwaite, Woodburn, Ulverstone, Lancashire.
Parrington, Joseph, Crossbeck House, Cleveland, Durham
Rees, William, Velindre, Lampeter, Cardiganshire
Bashford, W. C. L., Norwood House, Hounslow, Middlesex
Gibbs, Wm., Bishop's-Lydeard, Taunton, Somerset
Darnbrough, Thomas S., South Ottrington, Thirsk, Yorksh.
Jackson, Dr. (Princ. Med. Off. E.I.C.), Warley Barracks
Ellison, William, jun., Low Sizergh, Kendal, Westmoreland
Miles, Frederick, Stoke Hammond, Fenny-Stratford, Bucks
Bennett, John, Rissington, Stow-on-the-Wold, Gloucester
Hall, Collison, Navestock, Romford, Essex
Boughton, John, Adsett Court, Westbury-on-Severn

Wade, Richard, 58, Upper Seymour-street, Portman-square
Congreve, Walter, Comb Field, Brinklow, Coventry
Wade, R. Craven, Clonabraney, Crossakeile, county Meath
Rinder, John, Kirkby-Overblow, Wetherby, Yorkshire
Crawfurd, Robert, Saint Hill, East Grinstead, Sussex
Partridge, Ed. Otto, Hazleburst, Ross, Herefordshire
Dobson, Roger, Bridge-street, Whitby, Yorkshire.

FINANCES.—Mr. RAYMOND BARKER, chairman of the Finance Committee, presented to the Council the Monthly Report on the accounts of the Society, from which it appeared that at the end of the previous month the current cash balance in the hands of the Bankers was 207*l.* (including special balances on account of the country meeting and life-compositions). The Council adopted the suggestion of the Committee that Messrs. Nevile, Reid, and Co., of Windsor, should be requested to act as Local Bankers of the Society during the period of the Society's approaching meeting in July.

WINDSOR MEETING.—Mr. RAYMOND BARKER then reported the favourable progress of the preparations for the Windsor Meeting in the middle of next month.

JUDGES.—The Earl of DUCIE, as Chairman of the Judges' Committee, reported the selection of Judges of Stock for the Windsor Meeting; and the recommendation of the Committee that Prof. Simonds, as the Veterinary Inspector of the Society, should be requested to act as Referee to the Judges on that occasion, and to give his opinion on such points connected with the condition of the animals as breeding stock, and with their soundness as to hereditary affection, and infectious or contagious disease, as the Judges might bring under his consideration, for the purpose of aiding them in their decisions and in any report it might become necessary for them to make to the Council.—On the motion of Mr. Stansfield, M.P., seconded by Mr. Raymond Barker, this report, and the recommendation which accompanied it, were received and adopted by the Council. Prof. Simonds, who was present, expressed his perfect willingness to act at the Windsor Meeting in the capacity proposed.

MEMBER OF COUNCIL.—On the motion of Mr. RAYMOND BARKER, seconded by Mr. Stansfield, M.P., Mr. Law Hodges M.P. for West Kent, was elected into the Council, to fill the vacancy occasioned by the lamented decease of the Hon. Captain Pelham.

FRENCH COMMISSION.—M. Maurencq, M. le Baron de Montreuil, and the other members of the French Agricultural Commission, having presented to the Society a complete set of the proceedings of the "Congrès Central d'Agriculture," of which, on the occasion of their recent visit to England, they had been the representatives, these volumes were received with the best thanks of the Council; and on the motion of Mr. Brandreth, seconded by Mr. Jonas, a complete set of the Journals of the Royal Agricultural Society of England was ordered to be sent to Congrès Central d'Agriculture de France. Mr. Raymond Barker took that opportunity of stating, that Mr. Druce had most willingly undertaken, at the request of the Council, to receive these gentlemen at Ensham and show them his farm, and had made every preparation for that purpose; but, in consequence of the short stay of the commission in this country, they were unable to avail themselves of his hospitality and kind attention, of which they had expressed to Mr. Druce their sense in the handsomest terms. The Council desired Mr. Barker to convey to Mr. Druce their own acknowledgments of his desire, as a member of their body, to meet the wishes of the Council.

AGREEMENTS.—The agreements with the Authorities of Windsor and Lewes, in reference to the Country Meetings of 1851 and 1852, to be held at those places respectively, received the great seal of the Society and the signature of the Secretary, by order of the Council, and in their presence, agreeably with the terms and powers of the Charter of the Society.

FILLING-IN DRAINS.—Mr. Slaney's offer to give a prize of 10*l.* at the Lewes Meeting, for the best implement to fill in drains, was referred to the Special Council, when the implement [prizes for next year would be taken into consideration.

---

A WEEKLY COUNCIL was held at the Society's House in Hanover-square on Wednesday last, the 11th of June: present: Colonel CHALLONER, Trustee, in the Chair, Sir Robert Price, Bart., M.P., Mr. Raymond Barker, Mr. Buller (of Dilhorne), Mr. D. Burton, Dr. Calvert, Mr. A. Carden, Mr. J. Carden, Mr. Gadesden, Mr. Brandreth Gibbs, Mr. Baskerville Glegg, Mr. Hamond, Mr. Fisher Hobbs, Mr. Price Lloyd, Mr. Milward, Mr. Parkins, Mr. Pendarves M.P., Mr. Rowlandson, Mr. Villiers Shelley, Prof. Way, Mr. G. Wilbraham, and Mr. Wilson of Stowlangtoft.

MOUNTAIN FLAX.—The Hon. Captain RUSHOUT, M.P., transmitted to the Council, two specimens of Mountain Flax, with the following statement:—

"I enclose you a specimon of 'Mountain Flax,' as it is technically called in the district where it grows, in the hope that you may lay it before the Council, and that some cause may be given, or some cure suggested, for the deleterious effects which arise from it. No. 1 is the hay as drawn from the rick. No. 2 is the Mountain Flax culled out. It is common in the meadow ground in the south of Shropshire, from which the specimen is taken; and the farmer informs me, that it grows on the dry part of the field, in a deep loamy soil, partially drained.

"The land was manured last year with a compost of pond mud and lime. The farmer on whose land it grows has lost 10 or 12 head of cattle and horses. They were all affected by it in the same manner; first with purging, then with a stoppage. Since Christmas last, he has lost three horses out of five. None of the veterinary surgeons in the neighbourhood have succeeded in the treatment of it."

The hay containing this Mountain Flax was very similar in its appearance to a sample of coarse hay Professor Simonds had some months ago laid before the Council as obtained from Somersetshire, where a tenant of Lord Portman's had suffered much loss in his stock; it being a question at that time whether the atrophy and death of those cattle had arisen from the quality of the water to which they had access, the character of the herbage on which they chiefly pastured, or the insufficient amount of nourishment they derived from the food given to them, as the animals on removal to the Royal Veterinary College soon recovered their health and strength on change of circumstance and food. The Council accordingly referred these specimens of hay and Mountain Flax to Professor Simonds for his examination and comparison.—Mr. Rowlandson at once recognised the plant as the Linum catharticum or purging Flax. It occurred in different parts of the country, not only in pasture lands but among Wheat, on light loamy lands, the only cure for it being clean farming and high manuring. It was a miniature of ordinary Flax, bearing a small whitish blue flower, and cattle would eat a larger quantity of it than of better Grass.—Mr. Glegg remarked that it was common in Cheshire.—It may be added, that De Candolle includes this plant as a variety of Flax, in his order "Lineæ;" Sir J. E. Smith speaks of it as the "little" Linum catharticum, and as possessing purgative qualities; Sir W. J. Hooker describes it as an annual, everywhere abundant in pastures, with a slender stem from 2 to 6 inches high, having in June white small flowers gracefully drooping before expansion; Professor Low places it among plants indicating extreme dryness of the soil, and denoting infertility; Mr. Francis, in his "Little English Flora," refers to it as the "White Flax," and speaks of it in the following terms: "A little delicate plant that is abundant on most dry hill-sides, bearing small white flowers, which, when young, are elegantly drooping; one stem only comes from the ground; but at a little more than half way up it divides into two branches, and each of these a little higher into two others, and so on. It is violently poisonous, blossoms in July, and grows from 4 to 6 inches high."

GERMAN POTATOES.—M. KREEFT, the Mecklenburg Consul in London, transmitted to the Council, from a gentleman in Mecklenburg-Schwerin, near Rostock, much interested in agricultural pursuits, and himself a considerable landowner in that part of Germany, a supply of potatoes, for trial in England and Ireland, possessing such qualities of freedom from disease and powers of resisting its inroads, as would render their cultivation in this country highly advantageous under favourable circumstances of soil and locality. The Council ordered their thanks to M. Kreeft for this communication, and the following members undertook to try the cultivation of these potatoes and report the result to the Council: namely, Sir R. Price, Mr. Gibbs, Col. Challoner, Mr. Shelley, Mr. Fisher Hobbs, Mr. Raymond Barker, Mr. Carden (of Templemore, Mr. Wilson, Mr. Hamond, Mr. Parkins, and Mr. Burton.

SUBTERRANEAN ROOTS AND BONES.—Dr. CALVERT presented a specimen of fibrous substance having the flavour of the Turnip rind, which had entirely choked up No. 4 sized pipe-tiles laid nearly 3 feet deep in light and peaty land with a loamy subsoil, on the lower part of which a crop of Turnips had been grown and eaten off by sheep. The stoppage had occurred at the upper part of the field, to which it appeared that these fibres had ascended from the Turnips, in a direction contrary to the current of the water passing through the pipes.—Mr. Fisher Hobbs remarked, that these stoppages frequently occurred in light peaty land bearing crops of Mangold Wurzel, Carrots, and Turnips, and drained only to the depth mentioned by Dr. Calvert. In breaking up some land for draining operations, not long since, he was surprised to find that, at some time immemorial, the same land had been previously drained in a rude and imperfect manner, by laying the horns of bullocks and other animals 3 feet below the surface. These horns were in a perfectly sound and solid state, and in size were intermediate between those of the long and short-horned cattle.—Mr. Rowlandson referred to the use formerly made of wood and brambles for the purposes of draining, and he conceived that the bullocks' horns were merely substituted in some localities as being, under particular circumstances, more plentiful and ready at hand.—Prof. Way alluded to the long periods through which bones in large fragments would retain, not only their form and character, but also a great portion of their animal matter; and referred particularly to Marchand's examination of the bones of the bear, and to Dr. Buckland's discovery at Kirkdale, of the bones of the hyæna, and other animals no longer living unconfined in this country, some of which, though so long exposed to decaying influences, retained many of the characters of fresh bone. He thought these facts showed the necessity of reducing bones to very small fragments before employing them as manure on the land.—Mr. Rowlandson believed that, under the circumstances of decay alluded to, a slow chemical change was effected, the bone gradually acquiring an increase of fluoric acid.—Mr. Glegg stated that in Cheshire horn was excluded in the boning of dairy pastures, on account of its less disintegrating and fertilising qualities.

AUSTRALIAN GUANO.—The Council received from Professor Way the following report of his examination of the Australian guano, referred to him by them at a former meeting:

"June 11, 1851.

"I have examined a sample of guano from Western Australia, sent to me by direction of the Council, and beg now to forward the results of the analysis, and my opinion of its value as a manure. The sample is of a dark brown or coffee colour, interspersed with small lumps of a white substance, which is almost pure phosphate of lime. It has a slight musty but not ammoniacal smell, and is much heavier than Peruvian guano. The following is a detailed analysis of the specimen:

| | |
|---|---|
| Moisture | 30.04 |
| Animal matter and salts of ammonia | 14.75 |
| Sand | 3.94 |
| Lime | 21.07 |
| Magnesia | .17 |
| Potash | .27 |
| Soda | .29 |
| Chloride of sodium | .66 |
| Phosphoric acid | 20.44 |
| Sulphuric acid | 7.28 |
| Alumina, oxide of iron, and loss | 1.09 |
| | 100.00 |

The large proportion of moisture, the relatively small quantity of animal matter, and the absence of any considerable quantity of potash (of which Peruvian guano contains on an average 3 per cent.) are circumstances which leave no doubt that the manure has been exposed to the action of rain, which is destructive of its most valuable properties. The relation which this guano bears to Peruvian on the one hand, and Saldanha Bay on the other, will be better understood if I put them down in the form of a Table, omitting the less essential details. The following figures show the average composition of the ammoniacal guano of Peru and the phosphatic guano of Saldanha Bay, as compared with that of the sample from Western Australia:

| | Peruvian. | Saldanha Bay. | Western Australia. |
|---|---|---|---|
| Moisture | 13 09 | 22.14 | 30.14 |
| Animal matter and salts of ammonia | 52.61 | 14.90 | 14.75 |
| Sand, &c. | 1.54 | 1.62 | 3.94 |
| Earthy phosphates | 24.12 | 56.30 | 42.14 |
| Alkaline salts | 8 64 | 5.04 | 9.03 |
| | 100.00 | 100.00 | 100.00 |
| Ammonia furnished by 100 parts of each specimen | 17.41 | 1.60 | 0.75 |

"It is plain that this specimen of the guano from Western Australia, cannot be satisfactorily compared in respect to composition, with one supplying ammonia; and in judging of its value as manure, we must have regard to the Saldanha Bay variety, which is valuable as a source of phosphate of lime. Saldanha Bay guano is sold, I believe, at from 4*l.* 10*s.* to 5*l.* per ton; and the value of the sample from Western Australia will be less in proportion to the phosphate of lime which they relatively contain.

(Signed) "J. THOMAS WAY."

The Council expressed a hope, that although this first sample of the guano of Australia, from the most western point of that imperfectly explored colonial continent, and only just without the tropics and the rainless region, was not of such a quality as to compete with other established guanos, or to realise such a profit as to induce enterprise in its importation into this country, the simple fact that guano occurred at all on the islands of that coast, would be taken as an earnest of further research with greater success in a branch of discovery and trade, now become so important to the cultivators of England and America.

LECTURE.—Professor WAY's offer to deliver a lecture before the Members in the Council Room, on Wednesday, the 18th of May, at 12 o'clock, "On the Agricultural Employment of Gypsum," was accepted with the thanks of the Council.

Communications were laid before the Council from Mr. Hill Dickson, on Flax Cultivation, and from Mr. Barber Beaumont, on Locomotive Steam Power employed for Agricultural Purposes.

---

## METEOROLOGICAL REPORT.—JUNE.

(*Continued from page 366.*)

| Date. | Time. | Max. | Min. | WIND.—WEATHER. |
|---|---|---|---|---|
| June 4 | 1 p.m. | 29.82 | ... | P.M. SW. Brisk increasing breeze, and fine sunny day. |
| | 10.10 p.m. | ... | 29.82 | |
| 5 | 7 20 a.m | 29.75 | ... | SW. all day, and blowing hard; at 2 P.M. increasing, with heavy rain. |
| | 3.30 p.m. | ... | 29.64 | |
| * | 5 p.m. | ... | 29.64 | 5, ceased raining. |
| | 8 5 p.m. | ... | 29.69 | 8, calm. |
| | 10.20 p.m | 29.72 | ... | SW. Brisk, misty. |
| 6 | 6.55 a.m. | ... | 29.72 | Stiff SW. breeze, and densely overcast all day; barometer rising slowly. |
| | 10 p.m. | 29.84 | ... | |
| 7 | 6.55 a.m. | ... | 29.85 | Do. do. |
| | 7 p.m. | 29.90 | ... | |
| Sun. 8 | 8 a.m | ... | 29.92 | WSW. Brisk do., fine and sunny. |
| | 1 p.m. | 29.95 | ... | |
| | 5.10 p.m. | 29.95 | ... | After 1 P.M., barometer remained stationary, and wind backed to SW.; scud flying low, and threatening rain; overcast. |
| | 10.30 p.m. | 29.95 | ... | |
| 9 | 4.40 a.m | 29.89 | ... | SSW. all day. Densely overcast and rainy, with brisk breeze, increasing at nightfall; barometer falling steadily. |
| † | 10.20 p.m. | ... | 29.51 | |
| 10 | 7.15 a.m. | ... | 29.54 | WSW. Gentle, steady rain. |
| | 11 a.m. | ... | 29.54 | |
| ‡ | 12.20 p.m. | ... | 29.53 | P.M., barometer falling. Wind brisk, SSW. at 4.30, inclining to WNW.; frequent showers. At sunset wind northerly, barometer began to rise rapidly, and clouds to clear. |
| | 6 p.m. | ... | 29.56 | |
| | 10.30 p.m. | 29.72 | ... | |
| 11 | 7.55 a.m. | ... | 29.87 | NW. Moderate; fine and sunny day. |

* It is remarkable, that from 1 P.M. of the 4th until night of the 7th, about 85 hours, the wind continued steadily at SW., although the barometer rose steadily from the evening of the 5th. I conceive this storm, therefore, to have originated to the SW. of Ireland, and to have moved slowly northward.

† This storm came from the SW., and crossed Scotland to NE.

‡ This storm came from the westward, and crossed England to the eastward, travelling rapidly.

Dorchester, June 12th. F. P. B. M.

(*To be continued.*)

## Notices to Correspondents.

AMERICAN CHURN: *M J R.* Now that the first intensity of the American churn mania is over, perhaps some of our readers will kindly give us their experience as to its good and bad qualities, and their cool opinion of its merits.

CHICORY: *A Subscriber.* See page 154, and the Home Correspondence in this Number of the Paper.

CLOD-CRUSHER: *H E for W T.* Your communication was sent to our reviewer; and he will no doubt pay attention to it at the proper time.

COLTSFOOT: *J B H.* You must pull the flowers diligently in early spring—cut off the leaves diligently whenever they appear—and fork out the roots diligently on all proper occasions. There is no dexterous trick or manœuvre for extirpating Coltsfoot.—We know of no objection to rearing a *first* calf.

ENGLISH AGRICULTURAL SOCIETY: *An Essayist* must have patience. The award will be announced as soon as the judges shall have made it.

MANGOLD WURZEL DIBBLE: *Sigma.* It ought to be about a cone inscribed in a cubic inch. Where they are to be had we do not know.

POUNDED LIMESTONE: *A B C.* It would have both a chemical and mechanical effect on soils destitute of calcareous matter. Rain water will dissolve limestone.

SAND: *A Subscriber.* It will not pay to cart this sand for the purpose of making your clay soil more easily workable—notwithstanding that it will pay well to cart clay on the sand. Supposing the proportion of the two necessary to give the texture you desire in your soil be 15 to 85, then if the weight of the first 8 inches of soil be 1000 tons—there will be 150 tons of clay and 850 of sand in it. Now compare two cases deviating on either side of this composition by 5 per cent. on the part of the clay—one in which the 1000 tons consist of 100 of clay and 900 of sand, with another in which the 1000 tons consist of 200 of clay and 800 of sand—in order to bring their respective ingredients to the proportion 15 and 85, which we have fixed on as desirable, you will find that, while to the too sandy soil the addition of 58 tons of clay to the 100 already present would suffice, to the clayey soil the addition of not less than 333 tons of sand to the 800 already present, would be needed to improve the texture of clay soil; therefore we advise draining, stifle burning, liming, autumn cultivation, and manuring with fresh dung, rather than the direct addition of sand.

SCOUR IN PIGS: *J R R.* Prepared chalk, 1 drachm to 4 drachms; powdered opium, 1 grain to 4 grains; calomel, ½ grain to 2 grains. The above, according to the size of the pig, may be given twice a day in thick gruel. *W C S.*

SUPERPHOSPHATE OF LIME: *A Subscriber.* An ordinary dressing is 3 or 4 or 5 cwt. per acre, and an ordinary dressing of guano is 3 cwt. per acre. Commercial superphosphate varies much in the quantity of phosphoric acid which it contains; but if you go upon their relation as regards phosphoric acid alone, the superphosphate will be superior to the guano. The latter, however, justly sells at a higher price, because it contains large quantities of ammonia as well. Your question does not admit of a direct answer—these manures are in many respects different substances.

# Markets.

### COVENT GARDEN, June 14.

Trade still continues to be somewhat brisker. Peaches, Nectarines, and Cherries are much more plentiful. Hothouse Grapes are cheap. Pine-apples are more abundant, and there are some West Indian ones in the market; they fetch from 2s to 6s. each. Strawberries are good in quality; there are but few from the open ground yet. Dessert Apples are over for a season. Oranges and Lemons are plentiful. Nuts remain nearly the same as quoted last week. Vegetables of all kinds are abundant. Asparagus, young Carrots, French Beans, and Green Peas are received in quantity. Frame Potatoes may be obtained at 2d. to 4d. per lb.; old kinds realise high prices. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1s. per pottle. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis floribunda, Cinerarias, Moss and Provins Roses.

#### FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 6s to 10s | Almonds, per peck, 6s |
| Grapes, hothouse, p. lb., 4s to 8s | — sweet, per lb., 2s to 3s |
| Peaches, per doz., 12s to 24s | Lemons, per doz., 1s to 2s |
| Nectarines, per doz., 10s to 24s | Oranges, per doz., 9d to 2s |
| Cherries, per lb., 3s to 6s | — per 100, 6s to 14s |
| Melons, each, 4s to 8s | — Seville, p. 100, 7s to 14s |
| Strawberries, per oz., 3d to 9d | — — p. doz., 1s to 2s 6d |
| Gooseberries, per half sieve, 2s to 4s | Nuts, Barcelona, p. bsh, 20s to 22s |
| | — Brazil, p, bsh., 12s to 14s |
| Currants, per pottle, 6d to 9d | Cobs, per 100 lbs., 50s to 55s |

#### VEGETABLES.

| | |
|---|---|
| Cabbages, per doz., 6d to 1s | Shallots, per bunch, 3d to 4d |
| Greens, per doz. bunchs., 6d to 1s 6d | Garlic, per lb., 4d to 8d |
| | Artichokes, per doz., 3s to 4s |
| Cauliflowers, p. doz., 2s to 5s | Lettuce, Cab., p. score, 4d to 9d |
| Broccoli, p. doz. bundl., 7s to 8s | — Cos, per score, 8d to 1s |
| French Beans, p. 100, 1s 6d to 2s 6d | Small Salads, p. punn., 2d to 3d |
| Peas, per sieve, 3s to 5s | Horse Radish, p. bundl., 1s to 5s |
| Asparagus, per 100, 1s to 4s | Red Beet, per doz., 6d to 1s 6d |
| Rhubarb, p. bundl., 2d to 6d | Mushrooms, p. pot., 8d to 1s |
| Potatoes, per ton, 90s to 200 | Sorrel, per hf. sieve, 6d to 9d |
| — per cwt., 4s to 8s | Fennel, per bunch, 2d to 3d |
| — per bush., 1s 6d to 3s | Savory, per bunch, 2d to 3d |
| Turnips, p. bunch, 6d to 1s 6d | Thyme, per bunch, 2d to 3d |
| Cucumbers, each, 3d to 1s | Parsley, per doz. bun., 2s to 3s |
| Radishes, per doz., 6d to 9d | — Roots, p. bundl. 9d to 1s |
| — Turnip, p.doz., 8d to 1s | Mint, green, per bunch, 4d to 6d |
| Celery, p. bundle, 6d to 2s | Basil, green, p. bunch, 6d to 9d |
| Carrots, per bunch, 4d to 9d | Marjoram, green, do., 6d to 9d |
| Spinach, per sieve, 9d to 1s | Watercress, p. 12 bunch., 6d to 9d |
| Onions, p. bunch, 2d to 4d | Corn Salad, p. hf. sieve, 1s to 1s 6d |
| Leeks, per bunch, 3d to 4d | |

### HOPS.—FRIDAY, June 13.

Messrs. Pattenden and Smith report that the market for Hops continues to advance, and that the accounts from the plantations come worse and worse daily, both fly and lice being fast on the increase; little or nothing said as to duty, all parties agreeing that it must be very low.

### HAY.—Per Load of 36 Trusses.

SMITHFIELD, June 12.

| | | | |
|---|---|---|---|
| Prime Meadow Hay | 72s to 80s | Clover ... ... ... | 75s to 90s |
| Inferior ditto... ... | 55 65 | Second cut ... ... | 75 85 |
| Rowen ... ... ... | 55 63 | Straw ... ... ... | 25 30 |
| New Hay ... ... | — — | | J. COOPER. |

The supply of Meadow Hay short, but quite equal to the demand; trade brisk for good Clover.

CUMBERLAND MARKET, June 12.

| | | | |
|---|---|---|---|
| Prime Meadow Hay | 78s to 84s | Inferior ... ... ... | 65s to 78s |
| Inferior ditto... ... | 70 72 | New Clover ... ... | — — |
| New Hay ... ... | — — | Straw ... ... ... | 26 30 |
| Old Clover ... ... | 80 88 | | JOSHUA BAKER. |

WHITECHAPEL, June 12.

| | | | |

| Fine Old Hay ... | 75s to 80s | New Clover ... ... | —s to —s |
| Inferior ditto ... | 65 68 | Inferior ditto... ... | 70 75 |
| New Hay ... ... | — — | Straw ... ... ... | 24 28 |
| Old Clover ... ... | 85 92 | | |

### COAL MARKET.—FRIDAY, June 13.

Holywell, 13s. 6d.; Carr's Hartley, 13s. 6d.; Eden Main 13s.; Wallsend Braddyll's, 13s. 9d.; Wallsend Haswell 14s. 3d.; Wallsend Hetton, 14s.; Wallsend Lambton, 14s.; Wallsend Stewarts, 14s.; Wallsend Adelaide Tees, 13s.; Wallsend Tees, 14s.—Ships at market, 146.

### SMITHFIELD, MONDAY, June 9.

We had a larger supply of Beasts and an increased demand. We were enabled to quote 3s. 8d., it being pretty generally given for choicest qualities. The number of Sheep and Lambs was large, and the trade not very brisk; consequently prices were not better; indeed, for heavy Sheep, scarcely so good. A fair demand for good Calves, although it was difficult to obtain any more money. Trade for Lamb was brisk at Friday's rates. From Holland and Germany there are 290 Beasts, 1050 Sheep, and 139 Calves; from France, 13 Beasts; from Scotland, 240; and 2200 from Norfolk and Suffolk.

| Per st. of 8 lbs.— | s | d | s | d | Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|---|---|---|---|---|
| Best Scots, Herefords, &c. | 3 | 6 | to 3 | 8 | Best Long-wools | | ... | | |
| Best Short-horns | 3 | 4 | — 3 | 6 | Ditto Shorn | 3 | 4 | to 3 | 6 |
| 2d quality Beasts | 2 | 6 | — 3 | 0 | Ewes & 2d quality | | ... | | |
| Best Downs and Half-breds | | ... | | | Ditto Shorn | 2 | 10 | — 3 | 2 |
| | | | | | Lambs ... ... | 5 | 0 | — 5 | 6 |
| | | | | | Calves ... ... | 3 | 0 | — 4 | 0 |
| Ditto Shorn ... | 3 | 8 | — 3 | 10 | Pigs ... ... | 2 | 8 | — 3 | 8 |

Beasts, 3832; Sheep and Lambs, 28,890; Calves, 257; Pigs, 139.

FRIDAY, June 13.

We have a moderate supply of Beasts; however, quite sufficient for the demand; we cannot retain 3s. 8d. in our quotations, although it is made in a few instances. The supply of Sheep and Lambs is a fair average; trade is dull at Monday's prices. Calves are plentiful; middling ones are lower, but good ones still make 4s. From Germany and Holland we have 182 Beasts, 1280 Sheep, 231 Calves, and 60 Pigs; from Spain, 180 Sheep; from Norfolk and Suffolk, 400 Beasts; and 85 milch cows from the home counties.

| Best Scots, Herefords, &c. | 3 | 4 | to 3 | 6 | Best Long-wools | | ... | | |
|---|---|---|---|---|---|---|---|---|---|
| Best Short-horns | 3 | 2 | — 3 | 4 | Ditto Shorn | 3 | 4 | — 3 | 6 |
| 2d quality Beasts | 2 | 6 | — 3 | 0 | Ewes & 2d quality | | ... | | |
| Best Downs and Half-breds | | ... | | | Ditto Shorn | 2 | 10 | — 3 | 2 |
| | | | | | Lambs ... ... | 4 | 10 | — 5 | 6 |

| Ditto Shorn ... | 3 | 8 | — 3 | 10 | Pigs ... ... | 2 | 8 | — 3 | 8 |

Beasts, 954; Sheep and Lambs, 12,200; Calves, 437; Pigs, 520.

### MARK LANE.

MONDAY, June 9.—The supply of English Wheat to this morning's market was small, and the demand being better than of late, it was sold at an advance of 1s. to 2s. per qr.; the attendance was larger than for some time past, and foreign must be written 1s. per qr. higher, with an improved inquiry. —Spring corn of all descriptions was in request, and we raise our quotations 1s. per qr. on Barley, Beans, Peas, and Oats.—There is a better trade for Flour, but higher prices cannot be realised.

FRIDAY, June 13.—The arrivals of grain and Flour since Monday have been moderate. To-day's market was fairly attended, but it being difficult to establish an advance upon the prices of Monday for Wheat, the business transacted was limited, excepting in offers f. o. b. and afloat, in which the amount of sales is considerable. The quantity of spring corn on the market is very small, and held for an advance, which is in some instances paid.—Flour is in good demand, and brings generally rather more money.—A large business has been done in floating cargoes of Wheat, Barley, Beans, and Maize from the Mediterranean, at advancing prices.—The weather during the last eight days has continued very stormy with much rain, which is said to have greatly benefited the crops, particularly spring corn. The feeling for an advance in the price of Wheat has become more general, and the rise of 1s. to 2s. per qr. has again been established throughout the kingdom.

ARRIVALS THIS WEEK.

LIVERPOOL, TUESDAY, June 10.—The arrivals of grain and Flour from Ireland and coastwise this week are again trivial. The week's arrivals from abroad are large, but not over what our consumptive demand requires. The Corn Exchange this morning was well attended by millers and dealers, and, with a good healthy demand, prices improved. The advance since this day se'nnight may be called 2d. per bushel on Wheat, 6d. to 1s. per barrel and sack on Flour, ½d. to 1d. per bushel on Oats, 6d. per load on Oatmeal, 2d. per bushel on Barley, 6d. per qr. on Indian Corn, and 1s. per qr. each on Beans and Peas. Several large purchases of Wheat and Flour were made to-day to go some distance into the interior, which is an important feature to us, and indicates that there are lower stocks in the growers' hands than most people calculate upon.——FRIDAY, June 6.—The Market this morning was well attended by both town and country dealers. Fresh parcels of Wheat commanded the prices of Tuesday last, and American Flour was 6d. per barrel higher. There was also an improvement of 6d. per qr. each on Indian Corn, Beans, and Peas. Oats and Oatmeal brought fully late rates. 30s. 6d. per 480 lbs. was the top quotations for American yellow Indian Corn.

HORTICULTURAL TOOL WAREHOUSE.

GREEN AND CONSTABLE, WHOLESALE AND RETAIL IRONMONGERS, 36, King William-street (four doors from London Bridge), beg to inform Amateurs and Gardeners they have a large assortment of new and improved Garden Tools, including Lyndon's Patent Spades, Lord Vernon's Patent Hoes, jointed Hothouse Syringes, Galvanised Iron Garden Engines, Transplanting Tools, Patent Water-pots, Brown's Patent Fumigator, Improved Garden Labels and Sticks; also a large assortment of Saynor's Pruning and Budding Knives.

Glass Shades, Gas Glasses, White Lead, Colours, &c., as u su a

GLASS WATER PIPES.

MESSRS. COATHUPE AND CO., GLASS MANUFACTURERS, of Bristol, and Nailsea, Somerset, beg to inform Engineers and others that they are supplying GLASS PIPES, with their Joints, from 1 to 4 inches bore, capable of bearing very great pressures, in lengths from 3 to 7 feet, the lengths being less at the diameter of the brief increase. These Pipes may be seen at the Exhibition, with their various forms and modes of joining, in the Section allotted to the Glass Manufactures; and references can be given of their great utility in numerous localities, where they have been successfully employed. The great advantage of Glass Pipes for the conveyance of pure water over all metallic substances, has been too largely dwelt upon by medical and scientific authorities to require any further comment.

Nailsea Glass Works, near Bristol.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

---

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S-ROAD, CHELSEA.

E. DENCH having erected Two Patent Hothouses at the west end of the Great Exhibition, invites the attention of Gentlemen to the superior qualities, with the lowness of price, attending the erection of his Patent Houses; and having now ready for sale FIVE HOUSES of different sizes and descriptions on his premises, and some of them at a great reduction in the price, thinking of making alterations on his premises.

Hothouses built to be Glazed without Putty or Wood, and warranted not to drip under any circumstances.

Heating with Hot-water on the most scientific and economical principles.

---

ROYAL AGRICULTURAL COLLEGE CIRENCESTER.

*Patron*—His Royal Highness PRINCE ALBERT.
*President*—The Right Hon. Earl BATHURST.
*Vice-President*—The Right Hon. Earl DUCIE.

The COLLEGE will RE-OPEN, after the summer vacation, on MONDAY, AUGUST 11TH, for Agricultural and general Education. Lectures by professors of ability and experience, in Chymistry, Geology, Botany, Zoology, Veterinary Medicine and Surgery, Surveying and Civil Engineering, &c., are combined with practical instruction in Agriculture, and the several branches of a good education. Agricultural analysis will be undertaken in the Laboratory of the College at a low rate of charges.

For prospectuses and information respecting the course of studies, terms, &c., for in and out students, apply to the PRINCIPAL, the Rev. J. S. HAYGARTH, M.A.

---

DR. NEWINGTON'S AGRICULTURAL INVENTIONS.—In consequence of the unsatisfactory manner in which these Inventions have been carried out, and the imperfect state in which the Implements have been manufactured by DUFAUR and Co., Dr. NEWINGTON has found it necessary to withdraw the Licence he had granted them. He has now assigned all his Patents to Mr. GABRIEL, C.E., of 62, St. Martin's Lane, London, whom he can confidently recommend to the public. For the future, all applications should be made to him at the above address.

---

TO TENANT FARMERS, &c.

AGRICULTURAL EDUCATION.—Arrangements are made and Funds provided by several noblemen and gentlemen, advocates of combining "Science with Practice," to disseminate those principles through every county of England, by educating one or two youths from each county. They will be expected to know the fundamental rules of Arithmetic, and write a good plain hand on nomination, and to remain in the establishment two years at least. They will be taught Surveying, Measuring and Valuing Timber, Buildings, and Farm Stock; Analysing Soils and Manures; the Breeds, Management, and Diseases of Cattle; practical Mechanics, management of Steam Power; Botany, Mineralogy, and systems of keeping Farm Accounts, free of every cost; the parents paying only a small sum for their Board, Lodging, and Laundry.

Applications must be made, in the first instance, by letter to the Secretary for Agricultural Education, care of Messrs. DAWSON and SONS, Advertising Office, 74, Cannon-street, City.

---

HAYMAKING SEASON.—Look to your HAYMAKING MACHINES, that they are fit for use beforehand. Apply early for WEDLAKE'S, Original Patentee, still manufactured in a very superior manner for durability. Delivered free, at reduced charge, to meet the times' price.

MARY WEDLAKE, Widow, 118, Fenchurch-street, City, London, only maker.

---

REPEAL OF CORN LAWS.
HOW TO MAKE HAY AT ANY TIME, AND IN ANY COUNTRY, AT HALF THE USUAL COST. A Tract for the Times. Price One Shilling. Forwarded free upon receiving 12 postage stamps.—Address to MARY WEDLAKE, 118, Fenchurch-street, City, London.

---

---

BOYD'S SELF-ADJUSTING SCYTHE, (CLASS IX. OF THE EXHIBITION),

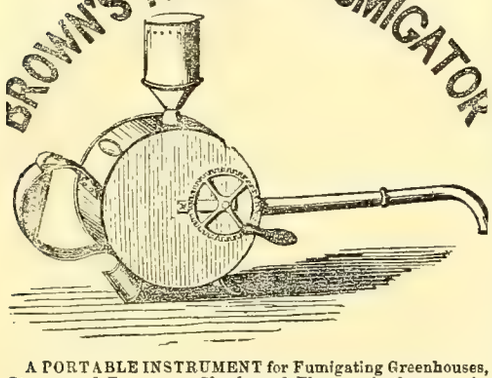
Can be put together and regulated to any angle by any person in one minute, without the assistance of a blacksmith; shuts up like a knife, and can be carried without danger. It effects a saving of 25 per cent. in labour, and can be used in an upright position if necessary. Manufactured and sold by DEANE, DRAY, and DEANE, Agricultural Implement Depot, Swan-lane, London Bridge; and to be had of all respectable Ironmongers.

---

THE GREAT EXHIBITION.—A valuable, newly invented, very small powerful Waistcoat-pocket Glass, the size of a Walnut, to discern minute objects at a distance of from four to five miles, which is found to be invaluable, at the Exhibition, and to SPORTSMEN, GENTLEMEN, and GAMEKEEPERS. Price 30*s.*, sent free.

TELESCOPES.—A new and most important INVENTION in TELESCOPES, possessing such extraordinary powers, that some, 3½ inches, with an extra eye piece, will show distinctly Jupiter's moons, Saturn's ring, and the double Stars. They supersede every other kind, and are of all sizes for the waistcoat-pocket, Shooting, Military purposes, &c. Opera and Race Course Glasses with wonderful powers; a minute object can be clearly seen, from 10 to 12 miles distant.—Invaluable newly invented preserving Spectacles, invisible and all kind of acoustic instruments for relief of extreme deafness.—Messrs. S. AND B. SOLOMONS, Opticians and Aurists, 39, Albemarle-street, Piccadilly, opposite the York Hotel.

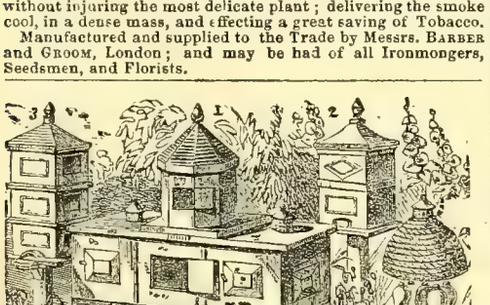
NOTICE.—AMERICAN PLANTS.



GEORGE BAKER begs to announce that his extensive collection of AMERICAN PLANTS will be in b oom on and after the 30th May, and may be seen gratis. The Nursery is situated seven miles from Staines Station, South-Western Railway, and three miles from Virginia Water, where conveyances may always be obtained.

G. B. takes this opportunity of informing the Nobility, Gentry, and Public that he is a Contributor to the American Exhibition, Royal Botanic Garden, Regent's Park.

Windlesham Nursery, Bagshot, Surrey, June 14.

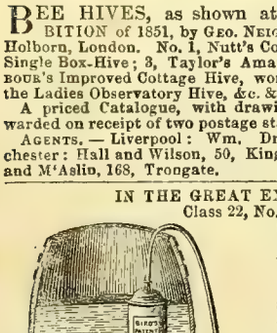


PRICE TEN SHILLINGS AND UPWARDS.

BROWN'S PATENT FUMIGATOR

A PORTABLE INSTRUMENT for Fumigating Greenhouses, Stoves, and Frames, or Shrubs and Flowers, in the open air, more effectually in conjunction with SANGSTER'S FLORUMBRA, without injuring the most delicate plant; delivering the smoke cool, in a dense mass, and effecting a great saving of Tobacco.

Manufactured and supplied to the Trade by Messrs. BARBER and GROOM, London; and may be had of all Ironmongers, Seedsmen, and Florists.



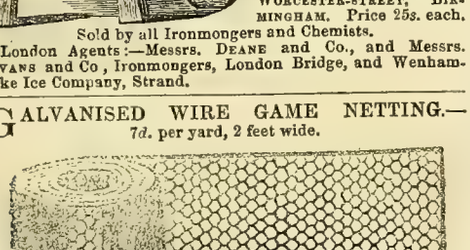
BEE HIVES, as shown at the GREAT EXHIBITION of 1851, by GEO. NEIGHBOUR and SON, 127, High Holborn, London. No. 1, Nutt's Collateral Hive; 2, Improved Single Box-Hive; 3, Taylor's Amateur Bar-Hive; 5, NEIGHBOUR'S Improved Cottage Hive, working three or five Glasses; the Ladies Observatory Hive, &c. &c.

A priced Catalogue, with drawings and particulars, forwarded on receipt of two postage stamps.

AGENTS.—Liverpool: Wm. Drury, Castle-street. Manchester: Hall and Wilson, 50, King-street. Glasgow: Austin and M'Aslin, 168, Trongate.

IN THE GREAT EXHIBITION,
Class 22, No. 267.

THE REGISTERED HYDROSTATIC SYPHON WATER PURIFIER.



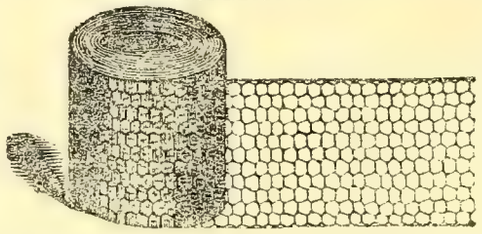
This instrument is self-acting and self-cleansing, and only requires to be dropped into the Water, and the Pipe hung down outside, in which position it becomes a Syphon. It purifies Rain, River, Tank, Pond, or Pump Water, however dirty, completely separating all animalculæ, thus rendering it perfectly wholesome.

Invented, made, and sold by ALFRED BIRD, EXPERIMENTAL CHEMIST, 15, WORCESTER-STREET, BIRMINGHAM. Price 25s. each.

Sold by all Ironmongers and Chemists.

London Agents:—Messrs. DEANE and Co., and Messrs. EVANS and Co, Ironmongers, London Bridge, and Wenham-lake Ice Company, Strand.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.



| | Galvanised. | Japanned Iron. |
|---|---|---|
| 2-inch mesh, light, 24-inch wide ... | 7d. per yd. | 5d. per yd. |
| 2-inch " strong " ... | 9 " | 6½ " |
| 2-inch " extra strong " ... | 12 " | 9 " |
| 1¾-inch " light " ... | 8 " | 6 " |
| 1¾-inch " strong " ... | 10 " | 8 " |
| 1¾-inch " extra strong " ... | 14 " | 11 " |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT-STREET, WESTMINSTER, LONDON;
48, NORTH-BRIDGE, EDINBURGH;
32, ST. ENOCH-SQUARE, GLASGOW;
1, CASTLE-BUILDINGS, DERBY-SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9d.; 24 ins., 1s.; 30s. ins., 1s. 3d.; and 36 ins., 1s. 6d. per lineal yard.

| | | | |
|---|---|---|---|
| Or a web of 100 yards, 18 ins. wide, will cost | ... | ... | £3 15 0 |
| Do. of 100 yards, 24 ins. wide | ... | ... | 5 0 0 |
| Do. of 100 yards, 30 ins. wide | ... | ... | 6 5 0 |
| Do. of 100 yards, 36 ins. wide | ... | ... | 7 10 0 |

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has in many instances been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1s. is equal to 2½ yards of another article in the market, the same width, at 9d. per yard. Samples for inspection sent free of expense.

C. D. YOUNG and Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Irela nd

CHEAP COPIES OF VALUABLE BOOKS.

SWEET'S BRITISH FLOWER-GARDEN, containing Coloured Figures and Descriptions of the most ornamental and curious hardy Flowering Plants, 712 finely coloured Plates; both Series complete, 7 vols. royal 8vo, cloth gilt, 6l. 10s. 1823—38.

This very beautiful work was published at 27l. It has for a long time been very scarce and difficult to procure, and copies usually sold, when they did occur, for upwards of 12l. It has always been considered the best work of the esteemed author. There are very few copies for sale.

EDWARDS'S BOTANICAL REGISTER; or, Ornamental Flower-Garden and Shrubbery; consisting of Coloured Figures of Plants and Shrubs, cultivated in British Gardens, accompanied by their History, best Method of Treatment, &c. New Series, edited by Dr. LINDLEY, with 750 beautiful coloured Plates, 10 large vols. royal 8vo, cloth gilt, 5l. 15s. (published at 22l.) 1838—47.

This is the new and complete series of this beautiful and esteemed work. As the number for sale is very limited, early application is desirable.

MEYER'S ILLUSTRATIONS OF BRITISH BIRDS AND THEIR EGGS. 322 beautiful coloured Plates, with Descriptions, complete in 108 Parts, forming 7 vols. 8vo, 8l. 8s. (just published at 18l. 18s.) 1841—50.

This beautiful publication is the only complete History of British Birds. The figures are all drawn and coloured from nature, under the Author's own inspection. The above is a subscriber's copy, and cost 18l. 18s.

CUVIER'S ANIMAL KINGDOM, arranged according to its Organisation, being a Description of Quadrupeds, Birds, Fishes, Insects, Shells, &c., by CUVIER and LATREILLE. Translated from the last French edition, with 4000 Figures, mostly coloured, on 800 Plates, 8 vols. 8vo, half morocco, 3l. 10s. (published at 8l. 8s.) 1837.

This is the most scientific and general work upon the subject, and the only one upon Natural History suitable for a "Home Library." The plates are engraved upon steel, and nearly all coloured, comprising upwards of 4000 Figures of Quadrupeds, Birds, Fishes, Insects, &c.

WOOD'S BRITISH ENTOMOLOGY; or, Illustrated Catalogue of the Lepidopterous Insects of Great Britain, containing 1944 Figures, beautifully engraved and coloured, of all the Butterflies and Moths, with an account of their localities, &c. 8vo, cloth, 3l. 10s. (pub. at 8l. 8s.) 1845.

This beautiful work is by far the most complete illustrated work on British Entomology, and is especially adapted for those forming collections, as it comprises Figures and Descriptions of every known species of Butterflies and Moths.

London: G. WILLIS, Great Piazza, Covent Garden.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.—Under the Patronage of Her Most Gracious Majesty the QUEEN.—The THIRD EXHIBITION for the Season will be held at the Royal SURREY ZOOLOGICAL GARDENS, on WEDNESDAY, 25th JUNE (open to all Exhibitors), when the Prizes will be awarded for the following productions, viz., Miscellaneous, Orchideous, and Specimen Plants. Pelargoniums, and Fancy varieties, Cape Heaths, Roses, Pinks, Ranunculuses, Fruit, &c.; also by Subscription, Prizes for Seedling Pelargoniums, Fancy ditto, Pinks and Ranunculuses, in addition to Certificates granted by the Society. The following Exhibitions will also take place at the Royal Surrey Zoological Gardens, on Thursday, 24th July, and Wednesday, 3d September. List of Prizes, and the Rules for Exhibition, may be obtained from, JOHN TAYLOR NEVILLE, Secretary.
Ebenezer House, Peckham, Surrey.

A GRAND HORTICULTURAL FETE, Under the distinguished patronage of H. R. H. the DUCHESS OF KENT, the EARL OF ABERGAVENNY, and the Nobility and Gentry of the neighbourhood, will take place in the CALVERLEY PARK, TUNBRIDGE WELLS, on FRIDAY, 27TH OF JUNE, 1851.

The Committee have great pleasure in announcing that they have made an engagement with Mr. EPPS, of the Bower Nurseries, Maidstone, to exhibit his magnificent Collection of Plants, and to superintend the Horticultural arrangements.

By the kind permission of the Commandants, the following celebrated Bands will be in attendance: The Band of the Royal Marines (Chatham Division). Master, Mr. ROGERS. The Brass Depôt Band (Maidstone). Master, Mr. TRESON.

A PROGRAMME will shortly be published, containing some of the most popular Pieces of the day.

Subscribers of 10*s.* 6*d.* will be entitled to Six Tickets. Non-Subscriber's Tickets, if obtained before the day of Exhibition, 2*s.* 6*d.*; on the day, 3*s.* 6*d.* each, to be obtained at Tunbridge Wells, of Mr. Clifford, Hon. Sec., and at Mr. Nash's Library; and at Maidstone, of Mr. Smith, Library, Week-street, and Mr. Epps, Bower Nurseries, Maidstone, and South-Eastern Nursery, Ashford; and at the Crown Hotel, Tunbridge.

Holders of Tickets will be admitted at 1 o'clock. At 4 the admission will be 1*s.*

A Marquee will be set apart for the Productions of Cottagers, to whom Prizes will be awarded.

NATIONAL FLORICULTURAL SOCIETY.
21, REGENT-STREET.

NOTICE IS HEREBY GIVEN, that Exhibitors of Azaleas, Pelargoniums, Ericas, Antirrhinums, Pinks, Roses, Ranunculuses, Fuchsias, Verbenas, Calceolarias, Petunias, Carnations, Picotees, Pansies, or miscellaneous subjects, must have all entered, labelled and staged, before 1 o'clock on Thursday next, the 26th inst. The Censors appointed are:

FOR AZALEAS AND ERICAS—Messrs. Fraser, Fairbairn, Rollisson, and Glendinning.

FOR PELARGONIUMS—Messrs. Gaines, Cock, Catleugh, Ambrose, Robinson, and the Rev. R. Garth.

FOR PINKS, PANSIES, CARNATIONS, PICOTEES, and RANUNCULUSES—Messrs. Neville, Keynes, Newhall, Norman, and Lidgard.

FOR ANTIRRHINIUMS, FUCHSIAS, VERBENAS, PETUNIAS, AND CALCEOLARIAS—Messrs. Salter, IVERY, Lochner, and Turner.

FOR ROSES AND MISCELLANEOUS SUBJECTS—Messrs. Lane, Denyer, Lee, Paul, and Parsons.

Censors should be punctually in attendance at 1 o'clock, at which time Exhibitors are required to withdraw. Members' privileged Tickets, for the admission of friends, can be had on application. By order, JOHN EDWARDS, Hon. Sec.
21, Regent-street, June 21.

CABBAGE SEED.—A quantity of fine early NONPAREIL AND BROMPTON IMPERIAL CABBAGE SEED, warranted genuine, and of last year's growth, is offered at 2*s.* 6*d.* per lb. These two well-known Cabbages are the best and earliest in cultivation.

Address fully (to prevent mistakes, there being two of the same name in Southampton), W. H. ROGERS, NURSERYMAN, 130, HIGH-STREET, SOUTHAMPTON.

IPOMŒA LIMBATA (LINDLEY).
(A New and Beautiful Hardy Climbing Annual.)

MESSRS. WM. ROLLISSON AND SONS have the pleasure to inform the Nobility, Gentry, and Public in general, that they intend sending out, on and after the 24th of June, their new and beautiful IPOMŒA (named by Dr. LINDLEY Ipomœa limbata), 10*s.* 6*d.* per plant, just coming into flower; the usual discount to the trade.

N.B. Fine plants of the true RHODODENDRON JAVANICUM, from 7*s.* 6*d.* to 10*s.* 6*d.* and 21*s.*, according to the size of the plant.—Tooting, Surrey.

EXHIBITION OF AMERICAN PLANTS—ROYAL BOTANIC GARDENS, REGENT'S PARK.

JOHN WATERER (the principal Contributor to the above Exhibition), begs to say that his unrivalled Collection is still in full bloom, and may be seen gratis by Orders from Fellows of the Society.—The American Nursery, Bagshot, Surrey, June 21.

NOTICE.—AMERICAN PLANTS.

GEORGE BAKER begs to announce that his extensive collection of AMERICAN PLANTS will be in bloom on and after the 30th May, and may be seen gratis. The Nursery is situated seven miles from Staines Station, South-Western Railway, and three miles from Virginia Water, where conveyances may always be obtained.

G. B. takes this opportunity of informing the Nobility, Gentry, and Public that he is a Contributor to the American Exhibition, Royal Botanic Garden, Regent's Park.
Windlesham Nursery, Bagshot, Surrey, June 21.

NOTICE.—EXHIBITION OF AMERICAN PLANTS, KNAP-HILL NURSERY, NEAR WOKING, SURREY.—The American Plants, at this Nursery, are now in bloom, and may be seen daily (gratis), Sundays excepted. The Knap-hill Nursery is within one hour's ride of London, being near the Woking Station, South-Western Railway, where nearly every train stops, and from whence conveyances may at all times be obtained.

HOSEA WATERER takes this opportunity of stating that the Exhibition of American Plants in the Horticultural Society's Garden, Chiswick, is entirely supplied from his Nursery, and that he is *not* this year a contributor to that in the Botanic Gardens, Regent's-park.—Knap-hill, Woking, Surrey, June 21.

CHOICE SEEDS, suitable for present sowing, all of the best quality. Per paper.—*s. d.*

| | |
|---|---|
| ANTIRRHINUM, saved from a superb collection | 0 6 |
| ANEMONE, new hybrid, splendid colour | 0 6 |
| CALCEOLARIA, saved by an amateur, from the most splendid show flowers | 1 0 |
| CINERARIA, from the choicest show flowers, saved by one of the best growers, from a superb collection of prize show flowers | 1 0 |
| HOLLYHOCK, double, saved by a celebrated grower, from Chater's best flowers | 1 0 |
| PANSY, very choice, saved by Thomson, and other celebrated growers | 1 0 |
| SWEET WILLIAM, very fine, singular colour | 0 6 |
| STOCKS, AUTUMNAL FLOWERING, 6 best and brightest colours, very double (per collection) | 1 6 |
| WALLFLOWERS, 6 beautiful varieties imported; these will produce a proportion of double flowers (per col.) | 1 6 |

The above are confidently recommended, having given great satisfaction previous seasons.—To be had of WILLIAM DENYER, Seedsman and Florist, 82, Gracechurch-street, London.

ROSES.

H. LANE AND SON'S extensive Collection will be in bloom about the 25th inst., and will continue during the season.—The Nurseries, Great Berkhampsted, Herts.

ROSE NURSERIES, HERTFORD.

E. P. FRANCIS offers the following ROSES, on Dwarf worked Stems, well established in 32 and 24 size pots, full of bloom buds, strong and vigorous, fit for immediate clumping, at 2*s.* each, carriage paid to London.

ROSES.

ADAM PAUL AND SON, NURSERYMEN, &c., Cheshunt, Herts, beg to inform admirers of the Rose that their Collection will be in full bloom the end of June and beginning of July. A day may now be agreeably spent amongst the various collections of Plants and Trees at the Cheshunt Nurseries. Twenty Trains of the Eastern Counties Railway leave and return to London daily. The Cheshunt and Waltham Stations are equally convenient for reaching the Nurseries.

ROSES.

"SANGSTER'S FLORUMBRA," for the protection of choice Roses, when in bloom, from sun or rain, as well as for destroying the Green Fly, with the assistance of Brown's Fumigator, may be had wholesale of Messrs. BARBER and GROOM, London; and retail of most Seedsmen and Ironmongers in the Kingdom; and of W. and J. SANGSTER, at their Manufactory, 75, Cheapside. Price, as Shades only, from 4*s.* each, or complete, from 7*s.* 6*d.* according to size. List of prices sent on application.

PLANTS OF CABBAGE, SAVOY, KALE, BROCCOLI, CAULIFLOWER, AND CELERY.

JOHN CATTELL, NURSERYMAN AND SEEDSMAN, Westerham, Kent, begs respectfully to inform the public that Plants of his superior true sorts of the above are now ready, and will be forwarded, as usual, to order, on receipt of postage stamps or Post-office order, made payable here, at the under-named prices, basket or mat, and package included.

All the sorts of Early Cabbage, Savoy and Kale, including Brussels Sprouts, 4*s* 6*d.* per 1000; all the sorts of Autumn and Spring Broccoli, 5*s.* 6*d* per 1000; all the sorts of Celery, 5*s.* 6*d.* per 1000; Cauliflower, Early and Late, and Red Cabbage, 9*d.* per 100; Drumhead, or Cattle Cabbage, 3*s.* 6*d.* per 1000. 6*d.* per 1000 less, when no mat or package is required. Packages of 1000 and upwards delivered free of carriage to the Edenbridge Station of the South-Eastern Railway. A Circular, containing the sorts of the above, may be had on application, by enclosing a penny stamp.

Seed of CATTELL'S Dwarf Barnes, and of his superior Dwarf Reliance Cabbage, may be had in packets, by post, for 12 penny stamps per packet, the former containing 1 oz. as usual, and the latter ½ oz.

TO THE ADMIRERS OF THAT SPLENDID AUTUMNAL FLOWER, THE CHRYSANTHEMUM.

YOUELL AND CO. are now prepared to execute orders from their extensive and very select collection of the above, comprising all the new and fine continental varieties, at the following prices:—

| | | |
|---|---|---|
| 50 best new sorts | ... ... | 25*s.* |
| 25 ditto | ... ... | 15*s.* |
| 12 ditto | ... ... | 9*s.* |

Well established in small pots, or by post free.

NEW DWARF CHINESE OR LILLIPUTIENNE CHRYSANTHEMUMS.

This new and beautiful class are well deserving the attention of cultivators from their exceeding dwarf habit (not attaining more than 1 foot in height). The profusion of flowers with which they are covered, as well as the great variety and distinctness of colour, will render them general favourites. Strong plants for autumn blooming are now ready for sending out at the following prices:—

| | |
|---|---|
| 9 fine varieties, sent out in 1849 | ... ... ... ... 5*s.* |
| 13 ditto raised by M. Lebois, and sent out for the first time last season | ... ... ... ... ... 12*s.* |
| 30 extra fine ditto, quite new, of this year, and selected by us when in bloom, 3*s.* 6*d.* each, 6 for 18*s.*, 15 for 37*s.* 6*d.*, or the set of 30 varieties | ... ... ... ... ... 60*s.* |

The above are perfect gems; engravings of the same may be seen at the Nursery.

Descriptive Catalogues of the above may be had on application. Printed directions of their successful and easy method of cultivating the Chrysanthemum for exhibition, &c., will be forwarded with all orders.—Royal Nursery, Great Yarmouth.

CHAPMAN'S SPRING KIDNEY POTATOES.—Messrs. C. and T. C. are now sending out sets of the above celebrated variety. Their produce are equal to the best forced Potatoes in appearance and flavour, and are in perfection from November until May, entirely superseding the use of glass; are abundant bearers, and are no more trouble than an ordinary crop. Directions for their culture will be forwarded with them, on receipt of a post-office order, payable at Brentford. Price 10*s.* 6*d.* per bushel, free to London.
Brentford End, Middlesex.

THE BEST EARLY TURNIP FOR FIELD CULTURE.
SUTTON'S EARLY SIX WEEKS.

A field of these Turnips, grown by Mr. E. W. Moore, Steward to Earl Radnor, on poor soil, at Coleshill, gained the 20*l.* prize at the Farringdon Agricultural Show in 1819.

JOHN SUTTON and SONS confidently recommend the above for first sowing, to feed off for Wheat.

*Also, for succession, the New Lincolnshire Red, and* SUTTON'S *Purple-topped Hybrid Yellow Turnip.*

The Lincolnshire Red Turnip (the stock of which was presented to Messrs. SUTTON, in 1849, by Philip Pusey, Esq., M.P.), should be fed off before Christmas; and SUTTON'S Purple-topped Yellow Hybrid, which is equal to a fine Yellow Swede, may be sown very late with certainty of success, and will keep till spring either in the field or housed.

Sold in quantities of not less than 10 lbs. weight, at the undermentioned prices, *carriage free*, to any station on the Great Western, South-Western, or South-Eastern Railways:—

| | Per lb. | per gallon. | per bush. |

SUTTON and SONS, Seed Growers, Reading, Berks.
Agents for the sale of Rivers's Stubble Swede Seed.

NEW DAHLIAS; E. FOSTER'S, Esq., CHOICE PELARGONIUMS; PICOTEES, CARNATIONS, HOLLYHOCKS, PANSIES, &c.

WILLIAM BRAGG, Star Nursery, Slough, begs to say his Catalogue of the above Flowers is now ready, and can be had on application. His choice SEEDLING DAHLIAS will be sent out the first week in May at 10*s.* 6*d.* each, viz :—

ADMIRAL, rich lilac, very constant, gained first Seedling prize, 25*s.*, at the Royal South London Exhibition; 21*s.* Shacklewell Open Shows, &c., fourteen first class certificates; the most successful flower of the year.

CARMINA, rich carmine, constant show flower, gained six first class certificates, &c., shown in several winning stands.

The Hon. Mrs. ASHLEY, waxy white, tipped with rose, splendid show flower, &c. W. B. thinks it the best Dahlia of the season; was awarded by Dr. LINDLEY a certificate of merit at the Horticultural Society, &c. Gained five first class certificates.

QUEEN OF FAIRIES, Domeyer. W. BRAGG has purchased the stock of this fine and constant fancy Dahlia, from the above amateur, who will give 5*l.* in prizes the next season for this flower. It gained a Seedling prize and first class certificate, with Edwards's Mrs. HANSARD; at the Royal South London Open Show Exhibition five first class certificates.

W. B.'s stock of Picotees, Carnations, and Pinks are strong and good; the best Hollyhock Seed ever sent out can be had in 2*s.* 6*d.* and 5*s.* packets, post paid, for prepayment.

---

GRASS SEEDS, FOR PRESENT SOWING.
PERMANENT PASTURE GRASSES.

*Mixed expressly to suit the soil for which they are required, at the reduced prices of 22s. 6d. to 28s. per acre.*

We are almost daily receiving unsolicited the most gratifying letters from our customers, in praise of our Seeds; and though we refrain from *publishing names* unnecessarily, we have much satisfaction in quoting the following :—

*From a Member of the Council of the Royal Agricultural Society.*

"Messrs. SUTTON,—I was particularly pleased with your Grass Seed, which I employed by itself, for laying down some fresh broken-up Land. It became a close fine sward by August. I have now about 30 acres of Land to sow immediately, &c. &c., and shall be glad of your advice for the purpose."

*From a Clergyman, an eminent Agriculturist and Member of the Royal Agricultural Society.*

"I have had the pleasure of praising your Seeds in many quarters beside that to which you refer. This I have done from a sense of justice only."

*Another Clergyman writes us*—"My Turnip crops are the admiration of all the farmers round, especially the Swedes and your Purple-topped Hyb id. I hope you have some of the same kind this year, as I am certain the superiority in my crops is mainly owing to the stocks."

*The above are similar to hundreds of others.*

N.B.—Instructions for sowing accompany every parcel of Grass Seeds; and any other information required by post will be promptly given.

*Goods delivered free of carriage to any Office in London, Bristol, Gloucester, Exeter, Southampton, &c.*

Reading, Berks, June 21.

---

*Packed in boxes of 50 feet each.*

6 by 4 in. and 6½ by 4½ in., 12*s.* per box; 7 by 5 in. and 7½ by 5½ in. 13*s.* 6*d.* do.; 8 by 6 in. and 8½ by 6½ in. 15*s.* do.; 9 by 7 in., 9½ by 7½ in., and 10 by 8 in., 16*s.* 6*d.*

*N.B.—The Patent Rough Plate, one-eighth of an inch thick, is supplied in quantities 62 by 18 inches, for 10 feet span ridge and furrow roofs, at a reduced price.*

NOTE.—Squares are charged according to the superficial contents, except where the length exceeds the restriction above, in which case the higher price is charged irrespective of the contents.

*Bending.*—1-8*th*, 6*d.*; 3-16*ths*, 9*d.*; ¼ *inch*, 1*s.* *per foot, net.*

*Irregular shapes are charged as squares.*

*When Crates are ordered, the 30-inch widths will be sent, unless otherwise specified.*

THE PATENT ROUGH PLATE, one-eighth of an inch thick, and weighing 2 lbs. to the foot, has now become an article of very extensive and increasing consumption.

*It is universally admitted to be the best and most suitable Glass for Ridge and Furrow Roofs, Greenhouses, Factories, Workshops,*

And all such like purposes, and is a cheap and efficient substitute for Fluted or Obscured Glass, where the object is to intercept the vision without diminishing the light. Its non-transparency, strength, and cost (being no more weight for weight than Common Sheet Glass), render it eminently suitable for the Glazing of Conservatories and Roofs of all kinds; Blinds are unnecessary, and when used in Greenhouses *no scorching occurs.*

Where still greater strength is required the 3-16ths and ¼ inch thick will be found much cheaper than the Common Rough Plate. Samples will be forwarded on application, by applying to

JAMES PHILLIPS & CO., HORTICULTURAL GLASS MERCHANTS, 116, BISHOPSGATE-STREET WITHOUT, LONDON.

---

Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

---

GLASS WATER PIPES.

MESSRS. COATHUPE AND Co., GLASS MANUFACTURERS, of Bristol, and Nailsea, Somerset, beg to inform Engineers and others that they are supplying GLASS PIPES, with their Joints, from 1 to 4 inches bore, capable of bearing great pressures, in lengths from 3 to 7 feet, the lengths being less at the diameter of the brief increase. These Pipes may be seen at the Exhibition (Section 24, Class 47, with their forms and modes of joining, in the Section allotted to the Glass Manufactures; and references can be given of their great utility in numerous localities, where they have been successfully employed. The great advantage of Glass Pipes for the conveyance of pure water over all metallic substances, has been too largely dwelt upon by medical and scientific authorities to require any further comment.

Nailsea Glass Works, near Bristol.

---

GLASS.

---

SHEET GLASS.

A. ADAMSON, 20, Davies-street, Berkeley-square (from C. Jarvis, Castle-street, Oxford-street), begs to acquaint gentlemen and gardeners that he has a superior stout Sheet Glass, in sizes from 12 by 10 to 40 by 30, at 3*d.* per foot, almost free from those defects of the surface generally found in common Horticultural Glass, and which is so detrimental for Horticultural purposes, on account of its acting as a lens, and destroying the plants it was intended to protect.

---

BEE HIVES, as shown at the GREAT EXHIBITION of 1851, by GEO. NEIGHBOUR and SON, 127, High Holborn, London. No. 1, Nutt's Collateral Hive; 2, Improved Single Box-Hive; 3, Taylor's Amateur Bar-Hive; 5, NEIGHBOUR'S Improved Cottage Hive, working three or five Glasses; the Ladies Observatory Hive, &c. &c.

COUNTRY SHOWS.—Tuesday, June 24: Handsworth and Lozells Horticultural.—Wednesday, June 25, and Thursday, June 26: Newcastle-on-Tyne Botanical and Horticultural.—Thursday, June 26: Maidstone Horticultural, and Liverpool Horticultural.—Friday, June 27: Tunbridge Wells Horticultural.

WE are among those who read "DICKENS' Household Words" with instruction and delight, and who look forward to every coming Saturday bringing us some new subject, discussed in the best spirit. No wonder, then, we should be eager to correct an error which he has fallen into, with regard to Horticultural matters; for the time presses, the green Pea season is at hand, and many of his readers who respect the "Household Words" as we do (and their name is legion), will be led into error, and the authority of the author impugned. Speaking of cheap pleasures (May 24), he wisely and honestly enumerates those of the table, and descants on the cheap luxuries of the poor and middling classes, enumerating various dishes of vegetables which he had eaten in Germany, and in which he could scarcely recognise the miserable ill-dressed watery dishes of garden stuff, which are met with at English tables.

Speaking of the pleasures of the table as one of the important matters of life, when moderately indulged in (and here Dr. JOHNSON agreed with him), he observes, "that in the present constitution of our code of cookery, eating is the most expensive of our amusements. This arises mainly from our neglect of vegetables. About the middle of last summer, at Kreuznach, we partook of a certain dish at the table d'hôte: it was delicious; some titled English travellers were present, who seemed equally charmed. Curiosity was awakened. What could it be? The German gentleman in waiting, napkin in hand, was despatched on a special mission to the *Chef de Cuisine*, to know what we had been eating; after remaining some five minutes in suspense, the receipt was revealed. It was a dish of *Pea-shells*, stewed in butter, with a sprinkling of savoury herbs. Pea shells are the ordinary diet of pigs on this side of the channel; but in Germany a little skill, a little butter, and a little herb removes them from the sty to the best dinner tables. 'The capacities of vegetables are mournfully misunderstood, Sir, in England!' said a plethoric old gentleman next to us, who had already been fed by our cookery within a beef steak or two of apoplexy. 'Look at me, Sir! You never see a foreigner in such a state as I am; but what with light wines, and this kind of thing (swallowing a mouthful of Pea-shells), I hope to get better.'"

Now we quite agree with the writer, that nothing can be more dreary and more circumscribed than our cooking of vegetables; but if Mr. DICKENS sets his readers to cook up with any herb, or any quantity of butter, the shells of our ordinary Peas, they will be unsuccessful; and the mockery of Mr. DICKENS' vegetarian cookery will become a *household word* with our ordinary cooks. Surely, Mr. DICKENS must have overlooked the absence in the German dish of the hard, indigestible skin which lines all the Pea-shells to which he was accustomed in England, and therefore he and his readers should be warned that no success will attend the concoction of the mess he recommends, let the PHILLIS be as neat-handed as she may, unless he first procures that variety of the Pea called *Pois sans Parchemin*.

Once or twice our excellent correspondent "Dodman" has attempted to call the attention of our readers to the importance of the good and varied cookery of vegetables, and now and then there have appeared in our columns a few valuable receipts; but this matter has not been taken up systematically. We must not talk now of Synods, even though they be of cooks; but why does not such a man as M. SOYER set up as Professor of Cookery, and give clinical lectures, and confer degrees in this art as well as the London University confers degrees in other arts. What a comfort to the young and tremulous housekeeper it would be, with a cross husband coming home to dinner, and comparing everything at his own table with what he was used to "at his club" in his bachelor days! Why, if a lady could go and taste the dishes executed under SOYER, and be named a senior optima even in frying, or a wrangler in omelettes, it is very possible she might, more than could be hoped for, smooth down the ruffled temper of her husband, and win golden opinions of her guests as regards the excellence and the economy of her table.

There is some lady (Mrs. ELLIS we believe), who has her young ladies taught such household duties as superintending cooking, pickling, preserving, scouring, and marketing. Let us hope she attends most especially to vegetarian cookery; and that the rising generation of husbands may hope to see even Pea-shells (without the parchment) well dressed at their tables.

---

THOSE who have LARCH PLANTATIONS should look at them just now. If the trees are thriving, green at the top, and well furnished with leaves, all may be well. But if the upper branches are bare or naked, or if the leaves there are yellowish, it will be probably found that the trunk is attacked with the "heart-rot;" and in dealing with this disease no time is to be lost. Should the disease have made much progress the trees are not likely to recover, and it will be better to remove them. If the symptoms are slight, it may still be possible to arrest the evil, by removing the cause of the mischief. What is that cause?

Many years ago we expressed an opinion that heart-rot is owing to the presence of too much water about the roots (July 15, 1843, page 488), a view in which our correspondents could not concur, because the disease is prevalent in dry sandy heaths (page 542 of the same volume), and concerning which other opinions have been subsequently expressed. For ourselves we adhere to our original conclusion, which was derived from the consideration of many cases that were then within our knowledge. We knew that the disease was most common on low stiff clay lands, where Larch grows for a few years with great luxuriance; that it is also frequent in mossy springy places, even on hill sides, if means are not taken to carry the water continually away; and that on hills it is chiefly near the bottom, where water collects, that the trees suffer most. As to dry sandy heaths often producing the disease, that is by no means irreconcileable with the view we originally expressed, because such places may be a mere layer of sand spread over a hard pan keeping down water, but through which the roots of trees can penetrate; or those places may be basins filled with water at the time when trees are making growth, although they become dry afterwards.

Many recent communications, which unfortunately show that the disease is becoming more and more common, render it desirable that the question should be again discussed; and that our opinion, if unfounded, should be shown to be so. In the meanwhile, setting aside speculation as to the cause of Larch rot, we may state what is certain upon the subject. It is certain that it begins in the heartwood, near the root; and that it spreads outwards, layer after layer crumbling like saw-dust. It is certain that among the crumbling mass is to be found in abundance a mouldy appearance, which is the spawn of some fungus. It is certain that when the rot has reached the alburnum a thick leathery white formation appears between the bark and wood, which formation is identical with the appearances connected with dry rot. We have not ourselves observed fungi proceeding from the leathery matter in question; but there is no room to doubt that they do proceed from it. Therefore it is certain that the Larch rot is a kind of dry rot.

But what causes this dry rot? It is by no means proved that fungi are the first cause of dry rot; on the contrary, it seems to be tolerably well ascertained that they merely appear in timber, because circumstances exist favourable to its decay; and that they, in the first instance, attack decaying timber, because it offers a suitable soil in which they may root. It is, however, admitted, that having once attacked timber, they spread with dangerous rapidity. Thus, a deal board placed on end, where air circulates freely all round it, was never known to suffer from dry rot; but introduce it into a floor on sleepers over heavy clay soil, making no provision for the rapid circulation of air beneath it, and in a few years the whole of the underside is overrun with dry rot. That is to say, place it where its surface begins to decay in consequence of the dampness to which it is exposed, and the dry rot fungi immediately seize upon it, and establish themselves among the rotting wood. Is it not probable, that in the case of the Larch the wood receives from heavy damp or spongy land more water than the leaves can carry off? that this water then collects among the tissue and brings on decay; and that this decay is immediately succeeded by a crop of fungus-spawn, which spreads rapidly round the centre where it first appeared, as fungus-spawn always does? To us this seems a satisfactory solution of the problem.

If this be so, the remedy for Larch rot is thorough drainage. To remove superfluous moisture is to do away with the cause which first induces decay, and prepares the wood for the inroads of fungi; and it is this proceeding that we must recommend to all who are suffering from what seems to be becoming a rural calamity. Perhaps our advice will be received with more favour if we support it with that of Mr. JAMES BROWN, of Arniston, the second edition,* of whose book on Foresting is the best work of the kind in our language.

"The Larch is a native of the south of Europe, and also of Siberia. It inhabits the slopes of mountainous districts, in the lower parts of which it attains its largest dimensions. In its native mountains, the Larch is never found prospering in any situation where water can lodge in the ground in a stagnant state; nor is it ever found of large dimensions in any extensive level piece of country having a damp retentive bottom or subsoil. On the other hand, the Larch in its native localities is found luxuriating upon a soil formed from the natural decomposition of rocks; for there the surface soil rests upon a half-decomposed stony subsoil, through which all moisture passes freely in its descent from the higher grounds. In this state of things, the roots of the trees always receive a regular supply of fresh and pure moisture, and, at the same time, the ground in which the trees grow is kept in a cleansed and sweet state, not having any stagnated gas or water lodging in it; and this forms, in my opinion, the perfection of soil for the cultivation of the Larch."

"Now, until on inquiry I was made aware of these circumstances relative to the Larch, as found in its native localities, I never could satisfy myself as to the cause of the disease which has appeared among the Larch plantations in Scotland; but since I have been made aware of the above circumstances, and have compared them with examples of healthy and unhealthy plantations on several estates where I have had the opportunity of examining for myself, I am now perfectly convinced as to the cause of the disease in question; and I am further convinced that any man who will compare the state of the ground upon which a healthy plantation

* "The Forester; a practical Treatise on the Planting, Rearing, and general Management of Forest Trees, with an Improved Process for Transplantation of Trees of large size." By JAMES BROWN, Forester, Arniston. Second edition, enlarged. WILLIAM BLACKWOOD and SONS, Edinburgh and London. 1851.

of Larch is found in Scotland (that is to say, one which has arrived at a considerable age, and is in a sound state), with what I have stated relative to the healthy state of trees of the same species as found in their native regions, will at once see the same circumstances acting in each case. Thus, in all cases of healthy Larch plantations in this country, where the timber has attained large size, and is sound in quality, we find them growing upon a soil through which the water that may fall upon it can pass away freely; as, for instance, upon the slopes of hills, and even in hollows, upon a strong clay soil, but where there is a proper drainage for the ready and free passage of the superfluous water; and I have even cut down Larch timber, of large size and sound in quality, growing upon a light sandy moss, 2 feet deep, which rested upon a stiff clay. In this case the moss was drained, and the water passed freely through the light soil; and the situation being upon a slope, there was a continual circulation of moisture passing along upon the top of the subsoil or clay."

"In a plantation on a level piece of ground, upon the estate of Arniston, I had occasion to cut down some Larches in the way of thinning. The plantation is about 40 years old, and consists of a mixture of Larch and Scots Firs. I found those which were cut in the central parts of this plantation, without exception, rotten in the heart, which was exactly what I anticipated, for the soil had never been drained; while some, which were cut upon one side of the plantation that formed a sloping sandy bank, were found every tree sound, and of excellent quality of timber; and, at the same time, every tree in this position was at least three times as large as those planted in the interior level parts of the plantation, although all were of the same age. Now, the cause of the superiority of the trees which grew upon the sloping bank may at once be seen, from what I have already said upon the point. Again, another side of this plantation was bounded by a deep ditch, forming a fence upon the edge of a field; and all along this ditch, upon the side of the wood, Larch trees of excellent size and quality were growing. Nothing can be more convincing than this, that, in order to grow Larch timber of sound and good quality upon land which formerly grew diseased trees, all that is required is to drain it, when success will be the result."

---

THE Fellows of the Horticultural Society will be glad to know that, by a recent resolution of the Council, it has been determined that the power of a Fellow to transfer his or her privileged *entrée* at half-past 12 on the days of Exhibition to a wife or sister has been extended to a brother, son, or daughter resident in the family. In this, however, as in the former case, the person to whom the privilege is transferred must be provided with an admission ticket signed by the Fellow.

## BALSAMS AND COCKSCOMBS FROM CUTTINGS.

THERE is certainly no great difficulty in raising and growing up to maturity both these beautiful subjects, if we procure good seed of the best kinds; because plenty of heat, good compost, and repeated shifts, with the precaution of always growing them close to the glass, will bring them to perfection. But how often do we find that plants are not naturally dwarf? that they will run away faster than we wish? and that the most beautiful flowers are occasionally upon plants which are not of the best habit? On such occasions it is well to practise the plan of lopping off their heads, and striking them; because we are enabled to make our choice when their flowers are partly developed. I have this season been purchasing the best seed I could procure, with the intention of shining, if possible, in Balsams; but having from various persons obtained nearly 40 different packets, all alleged to be "the best in England," and greatly varied in description, I devoted a large seed pan to each kind, and pricked out three of each, which gave me a goodly number; and having the others in the pans, with the view of planting them out in the borders if I should use them at all. One party had advertised six varieties for 2*s.* 6*d.* in sealed packets, and a separate packet of straw-coloured Balsam, also sealed up. Perhaps I took more pains with these than others, for I picked them all out. When I saw by repotting three of every sort, and growing them up to early bloom, that several of the varieties were worth growing, I naturally turned to the store pans to grow them all, but they had grown a foot high, and were as thick, and I may almost say as thin, as Mustard and Cress. As plants, they are totally useless. Unwilling to lose them, I took off all the tops, cut them up to a joint, and used the ordinary means of striking them. I rooted nearly the whole of the choice sorts in bottom-heat, first picking off all the buds that I could get hold of, and soon found myself in possession of a quantity of dwarf plants, not 3 inches high, potted into 4-inch pots, and promising to be handsome. These have progressed to my entire satisfaction, and I can safely say, that nothing strikes more freely. I was moved to this practice by the result of an attempt last year to obtain a succession of Balsams when the plants had become ugly, for I then picked off the upper buds, took off the tops, about 3 inches long, and (somewhat carelessly, I admit, for I was busy) put them under bell-glasses, with the best bottom-heat I had; the result was, that about one out of three rooted, and I had some fine dwarf plants, long after the others had seeded and died. I feel convinced, that had my bottom heat been sharper, they would all have rooted. However, my experiment this year has so completely answered, that I am very likely to repeat the experiment. With regard to Cockscombs, I have long practised the decapitation system. I allow them, after pricking out five or six round the edge of a 4-inch pot, to grow till they show their bloom, and I then take off the tops of the most promising, so as to have only six leaves above the soil, put them at once singly into 3-inch pots, plunge them all in the tan of a hothouse and shade them for a week; I then place them as near the glass as I can, keep them well watered, and shift as soon as they reach the side with their roots; the leaves and flowers grow as freely as in seedlings, but when I give them their first shift, I transfer them to a hotbed, made up on purpose, keeping them always as near the glass as possible; the leaves are of course close down to the pot, grow as large as ever I saw them on seedling plants, while the flower increases to a monstrous size, incredibly large for such dwarf plants. The only condition required is to let there be 2 inches of stripped stem below the six leaves we mean to form the plant, and let an inch and a half of this be put into the soil. They do not require covering with a glass, but there should be a genial heat in the tan; or if they are struck in a hot-bed, let the pots be plunged until they have struck root, or for one week at least, then they may be placed on the level surface.

I need not point out the advantage of this treatment; when we happen to have bad seed, yielding a straggling sort (or, as I have had this year, a batch, not two of which come alike), it enables one to select a few of the best in a forward state, and to grow a few tolerable plants, when by the ordinary means there would be a total failure. While upon the subject of Balsams and Cockscombs, I wish to remark that the notion which has long prevailed, that Balsam seed should be old to become double, or that old Balsam seed is better than new, is altogether erroneous. I have Balsams whose individual flowers are as double as a Camellia or a Rose, and these from a crop of seed saved by myself in September last; and I would also remark that they are very nearly true to the varieties they were saved from. My Cockscomb seed was purchased at a London seed shop, and I know nothing of its origin; but the plants, except those four cuttings, are all heights and colours, from yellow to crimson, and the foliage of scarcely two is alike. *Y.*

## FOREIGN GARDEN GLEANINGS.

(ST. PETERSBURGH.)

AMATEUR GARDENS: COUNT NESSELRODE'S. — The honour of giving the first impulse to horticulture in Russia is due to Catherine II. Since her time, gardening has become more and more fashionable, so that very fine private gardens are to be met with out of the royal domains. Of these, that of Count Nesselrode stands in the first rank, and is remarkable for its numerous collections of plants of every climate. Of Camellias, especially, there are very numerous and rare species of surpassing beauty; they form in one (a large house), a sort of hedge, which when in full flower, is extremely magnificent. There are many tropical plants well worthy of notice. The garden is by no means large, but laid out in the English style, with great skill and taste. Few effects are more pleasing than that produced by the trees, shrubs, and bushes, grouped with reference to their size, and the contrast produced by their foliage, and the size and colour of their flowers. We were much struck with masses of Japan Lily covered with flowers, and surrounded by belts of Chinese Pæonies. We saw, too, Datura arborea in the midst of beautiful Scitamineous plants, enormous plants of Erythrina Crista-galli, contrasted with all the blue-flowered Salvias, fine specimens of Fuchsia corymbosa, fulgens, &c.; the whole being set off by beautiful turf, itself dotted here and there with little flowers of various forms and tints.

PRINCE COCHOUBET'S GARDEN.—This enjoys a great reputation amongst the lovers of horticulture. The houses are large and numerous, and filled, for the most part, with Leguminous plants; there are Acacias, Cytisus, Genista, the double-flowered Ulex, Anthyllis, and Sophora. These trees, the greater part of which in France are grown in the open air, are kept in houses in Russia, and are used for decorating the interior of the mansions. We noticed the Clethra arborea more than 8 yards in height, and varying in price from 24*l.* to 32*l.* a piece. As in all the gardens of Russia, Camellias in espalier are abundant; there was one of these plants which certainly surpassed anything we had previously seen; it was 6 yards high, and separated the house in which it was into two compartments. There were a large number of Rhododendron arboreum from 5 to 8 yards in height; a hothouse full of Musads attracted our especial attention. The red gravel walks contrast curiously with the adjacent green sward.

PRIVATE GARDENS: PRINCE WIASINSKI'S. — This nobleman, who is a great amateur, admits into his garden nothing but the rarest and most beautiful plants; it was here that we found the younger brother of the Araucaria excelsa of our own winter garden, bought by the Prince himself for 280*l.* He possesses an Orange tree almost as large as the connétable of Versailles; some specimens of Laurus nobilis with heads 3 or 4 yards in diameter, to be found nowhere except in Russia; and a very fine collection of rare Conifers, of which he is extremely fond. Amongst them are a beautiful Pinus longifolia, 6 or 7 yards in height; some fine specimens of Podocarpus, Dacrydium, Dammara, Aralia trifoliata, elegans, and crassifolia of enormous size. His houses contain many rare Orchids as yet unnamed. But the finest plant in this magnificent collection is undoubtedly a Luculia gratissima, which occupies a small house and is 6 feet high, and as many broad, and yields annually two or three score of beautiful bouquets of flowers. The Palm house has one immense slanting side, its interior produces a fine effect, the ground being broken and crossed by walks, winding amongst Palms and other rare plants. On the hills, slopes, and low ground, are a crowd of tropical plants in the open soil; the whole surface is covered with Moss and elegant Ferns; but we were most struck with a Littæa geminiflora surmounted by a spike of flowers, 5 or 6 yards high, and situate on the top of a rock, shaped like a kiosc.

PRINCE GAGARIN'S.—The garden of Prince Gagarin, inspector of the Imperial Gardens, although small in size, contains several genera of plants raised by the plan adopted by Parisian horticulturists, but very little known in Russia. Independently of this, they with difficulty give to their plants that elegance which is so remarkable in those trained by our own gardeners. Amongst the plants cultivated by this prince, we may mention the Indian Azalea, Pelargoniums, Rose trees which strike from cuttings, and which are found in great quantity in his houses. We were much struck with a one-year's shoot of a bud of an India-rubber tree, which was no less than 5 feet in length. This nobleman assured us that this tree accommodated itself with great ease to the temperature of dwelling-houses, and we saw many of them in his apartments. Dahlias are not to be found in much variety in Russia, but their flowers are kept as long as in France, and at a less advanced season of the year. They are taken up two months before our own, separated and planted in pots under sashes in December; and in June, when they are planted, they are in full flower. In this garden we saw a curious seed-bed of Pines from the Caucasus. *Masson's Report.*

## BRITISH SONG BIRDS.

(CAGE BIRDS, No. 18.)

No. XXXIV.—Another needful caution, at this season, with respect to nightingales, is,—never to let them hang up in the vicinity of fresh paint. Some years since, my house was undergoing repair; and amongst other workmen, the painters were actively employed. In a thoughtless moment, I suffered my birds to remain out as usual; but I was signally punished for my folly. The white-lead had acted fatally in one short day, upon the lungs of two very choice songsters. On the following morning they were dead! This was dearly-bought experience; for my heart was chained to these most affectionate little creatures. Nor was their's less so to me.

Few persons can be aware of the delicacy of lungs peculiar to the summer warblers; and large numbers of them perish from the ignorance prevailing on this matter. Thus, these tender little fellows are often domiciled in the winter, in a hot, close apartment; with a raging fire, and sudden draughts, alternating: or, in summer, they are hung in a closely-confined bed-chamber, ready for being put outside the window the first thing in the morning. In this latter case, the carbon evolved by the sleepers in the apartment very often materially injures the bird, whose health can never afterwards be restored. Let it ever be remembered, that birds and plants want as much attention as ourselves paid them, in the matters of air, heat, and cold, or they cannot thrive. It is against nature that it should be otherwise.

As the season for nestlings is now at hand, I would call attention to the fact of these birds being, when young, very tender; they must, therefore, be kept in the nest, covered over lightly with a piece of flannel, until they show signs of increasing strength. They should then be put in a long, covered cage, the bottom being thickly strewed with very fine red sand, quite dry and sweet. Place them in a sunny spot; and be sure, when you feed them, that the food is fresh and wholesome. They will soon learn to perch; and the males will "record" their song before they are six weeks old. Their early notes are sweetly musical.

We have, as yet, spoken only of the melodious voice of this bird; but truth compels me to say that, sometimes, the sounds they utter are harsh, discordant, and incongruous. To create an ugly word, to express their still more ugly vocabulary, I should say they "squawk." This, however, is after their song is over, and principally in the autumn. The whole habits of these birds then appear to undergo a change. They seem thoughtful, heavy, and happy, by turns; and their heart is most assuredly anywhere but in a cage. If any bird may be said to "think," it is the nightingale. When caged, and provided you are kind to him, he begins to grow cheerful about Christmas, whose festivities he often ushers in with a merry song. Philomel loves to chant,—

"When the Christmas log is burning."

The cause of the nightingale singing so mellifluously, is his having so large a larynx. His intonation is as powerful as it is perfect. All his notes are harmonious and effective. If by your mode of treatment, you can make a "friend" of a fresh-caught, newly-arrived bird, he will devote himself to you, body and soul. I envy you *such* a friend! Such I have had; such, alas, I have no longer! No value could be put upon the birds I am speaking of; they are inestimable.

There are very many persons who are fond of birds, and yet, perhaps, not like myself and a few others—"enthusiasts." To such I would say, care nothing about the fresh arrivals in April, but purchase either branchers or nestlings, in August, of the dealers. Being imitative birds, they will copy *anything*; and with such a powerful

compass of voice as falls to their share, they can, as I have before hinted, sing nothing *badly*.

I once entered a shop to inquire for some young redstarts. Whilst chatting to the dealer, I observed a very ragged-looking nightingale at the end of the shelf, and carelessly asked—what might be his age? The man at once gave me his history. It appeared his master (a brute!) was tired of him, and had brought him to town to be sold. The man candidly told me he was a "nestling," in his second year, and he knew nothing particular about him. His old master wanted 10*s.* for him. There was something about this bird's eye, something in his bearing, that won my heart over at once. I bought him at his estimated value, intuitively feeling I was "all right," and that I had won a prize.

Never had I shown more judgment. This very bird, despised of his old master, became my most intimate friend and companion. He sang all the notes of a nightingale, a thrush, a blackbird, and a sky-lark. He was "everything by turns, and nothing long." His song was perpetual when I was at home. When absent, he would sing to his mistress in a kind of interrogative strain; throwing himself into the most grotesque attitudes, and listening, *arrectis auribus*, to every arrival at the door. To say that this bird recognised my step, and knew my voice, is nothing—when compared to his *affection* for me. He not only sang out, at the top of his voice, the moment I entered the door, however late the hour of my arrival, but I was obliged to open the door of his cage, and let him out *to sit on my finger*. There alone would he rest contented, and sing in that same position so long as a lighted candle remained in the room. I then kissed him—I am not ashamed to say so—and my own hand conducted him to his apartment. This bird was murdered—by Quassia. I enjoyed his society three years only.

It must, however, be understood, that although these branchers and nestlings will sing *anything* "well," it is highly desirable never to hang them up with any but *good* birds. Those I have mentioned are quite unobjectionable; as are also the tit-lark, wood-lark, robin, and canary. Keep them quite out of the way of parrots and macaws; and all such shrieking animals. If they hear these, and *imitate* them, it will be a kindness to at once shorten their days—and so add to your own at the same time. There can be no mistake about this.

There certainly is one advantage in keeping nestlings and branchers, which those who are not enthusiasts will highly prize. These birds do *not*, as I have already shown, actually require to be fed on raw meat and egg. They will live on German paste and sweet bun, if accustomed to it when they are two months old. A mealworm every now and then, when they droop; an earwig, a wood-louse, some ants' eggs, or a spider—will keep them in excellent trim.

As for tameness,—no bird is more alive to kindness than the nightingale. If only you show towards him one tithe of the affection that is so frequently lavished on the ugliest of our ugly half-shorn French poodles—who never by any chance value it,—you will find him the best of companions — the very firmest of friends. *William Kidd, New-road, Hammersmith.**

## GARDENERS' BENEVOLENT INSTITUTION.

We understand that a donation of 50*l.* has been made to this Institution by the Queen and H. R. H. Prince Albert, and that her Majesty has graciously condescended to become Patroness of the Institution.

The following speech, in reply to Mr. Chadwick's toast, "Market Gardeners and Horticulturists," was inadvertently omitted in our report of the anniversary meeting last week:

Mr. Spencer returned thanks for the honour which had been conferred on the horticulturists. The gentleman who had proposed the toast (Mr. Chadwick) had dilated on the advantages which the agriculturists had derived from the exertions of the horticulturists. I (said Mr. Spencer) agree with him, and I believe if the agriculturists would take more from us—if they would adapt themselves still more to our practice—they need have no fear whether they have protective duties or not. (Hear, hear.) No one can deny that the horticulturists have taken immense strides of late years—no one can deny that the art and science of horticulture has progressed to an extraordinary extent. (Hear, hear.) I claim for it no pre-eminence; but I say, however great the advance which may have been made by other arts, our art has advanced to an equal extent. (Cheers.) We have an immense advantage in the name of our Chairman; and his presence amongst us to-night as one of us is sufficient, I think, to show that we have ability, energy, and perseverance enough to undertake and achieve any object within the limits of our art, and even beyond them. (Hear, hear.) What gardener ever entered the Glass Palace in Hyde-park without feeling proud of his art, when he reflected that that grand idea emanated from one of his own profession—(applause)—that it was a gardener that had the genius and the boldness to conceive a plan in every way so admirably adapted for its purpose, while it sets all the ordinary rules of architecture at defiance. (Cheers.) But, gentlemen, I am sure you will agree with me when I say that that building, great as it is as a work of art, is in another aspect an object of far higher importance—I would look for a moment at the future, not at the past, and in that view I regard the Great Exhibition as a pledge held out by this country of good fellowship to all mankind. (Loud cheers.) And however much we may admire what has been done by the talent of Mr. Paxton, and by the exertions of others in designing and carrying out the work—if it fail in accomplishing that great good we anticipate from it, the promotion of good will and fellowship among men—better were it, I say, that the glass and the iron remained in the ground. (Cheers.) I trust no foreigner will come to our shores to examine the innumerable productions collected together in that building from all parts of the world, but will return to his own country convinced that we are not the churlish barbarians we have been supposed to be, but that we have hearts open to receive our fellowmen with kindness and hospitality, and that we possess ideas which we are ready to communicate for their advantage. (Cheers.) So far as regards horticulture, we all know the beneficial effect it has on the human mind. In my earlier days I remember the attractions which the ale-house had for a large proportion of the community, but now, thanks to the improved state of horticulture, and the taste which has in consequence grown up for it, almost every labourer and every tradesman in the country devotes his leisure to the garden, in which he finds a relaxation which ennobles his mind and enlightens his understanding. (Hear, hear.) Mr. Spencer concluded by observing that the love and fellowship they were that day exhibiting to the indigent and the helpless would be permanent in its results, and by again thanking the company on the part of the horticulturists.

## ORCHIDS FOR THE MILLION.—No. V.

By B. S. Williams, gr. to C. B. Warner, Esq., Hoddesdon.

Treatment of Plants in Flower, and the best Mode of Protracting their Bloom. — There are many Orchids that will succeed, when in flower, in a much cooler house than that in which they are grown, or even in a warm sitting-room. In the following remarks I shall endeavour to point out the advantage of keeping them during their period of flowering in a cool and dry atmosphere rather than, as is frequently the case, in a hot and moist house; in the latter, the flowers do not last nearly so long as they do when moved to a cooler house or a warm room. Perhaps there are not many cultivators who have studied this point more than myself, and I never found the plants injured by this treatment. Some imagine that, if they are put in a cool place, they will be injured; but this, according to my experience, is an error. During the time they are in a room, the temperature should not be below 50°. At night the room should be kept quite dry, and, before they are removed from the stove, they should be put at the coolest end of it; or, if there are two houses, those that are in the hottest should be moved to the coolest for a few days before being taken into the room, and they should be allowed to get nearly dry, and should receive but very little water—only enough to keep the roots moist. The flowers should not receive any moisture.

I will name a few that I have tried in a room during the months of May, June, July, and August. I have kept Saccolabium guttatum in this way five weeks, Aerides affine the same time; A. odoratum or roseum and some of the Dendrobiums, viz., nobile and cærulescens, I have kept in a room four and five weeks. D. moniliforme, D. macrophyllum, D. pulchellum, D. Ruckeri, and D. secundum, last a much longer time in bloom if they are kept cool. Brassias and Oncidiums, Epidendrums, Odontoglossums, Cyrtochilums, Trichopilia tortilis, Lycaste Skinneri, L. aromatica, L. cruenta, Maxillaria tenuifolia, Aspasia lunata, and all the Cattleyas, succeed well in a cool room or house, and last for a much longer time in flower. I have kept Lælia majalis in a cool room four and five weeks, and L. flava will keep a much longer time in blossom than in the warm house. When the bloom is past they should be removed to the stove, where they should be placed in the coolest end, and where there is plenty of shade; they should be kept there for about ten days, as, if they are exposed to the sun, they are very apt to become scorched.

Treatment of Plants previously to being taken to a Flower Show.—It is my practice to move them to a cool dry house or room for a few days. If the plants are growing in the hottest house, I move them to the cooler one; they should not receive any water for two or three days, and should be allowed just enough to keep them slightly moist. When it is probable that the plants will come into blossom earlier than is wished, the time of flowering may be successfully retarded by taking them to a cooler part of the house, or even putting them in a greenhouse, keeping them slightly shaded during the brightest part of the day.

## TRADE MEMORANDA.

James Watson, 4, Edge Terrace, Kensington Gravel Pits, and Gravesend.

## Home Correspondence.

*Fruit at the Chiswick Exhibition.*—Your correspondent "A. H." charges the judges of fruit with being profuse in their award of medals for Grapes in Class 3 at the May and June exhibitions, and also charges them with giving them for unripe fruit; to which charges, as one of the judges, I must beg to plead "Not Guilty." There is, as you are aware, different degrees of ripeness at which fruit is used; the growers of fruit for the market cut their Grapes as soon as they are saleably ripe, and I consider it would be wrong to disqualify such Grapes at the Horticultural Gardens. The principle by which I am guided is marketable ripeness; still, if I have any doubt as to ripeness, viz., marketable or eatable ripeness, I taste them with my brother judge, and unless we agree that they are marketably ripe, no prize is awarded. I must beg to differ in opinion with "A. H." as to not giving prizes for fruit till July. The Society's object is, as in my opinion it ought to be, to reward the skill of the practical gardener, and there would be comparatively little skill required to produce good Grapes in July. As to the idea that the kinds of Grapes named by the Society, having been brought to the highest perfection, ought not to be shown, may not the same be said of Pelargoniums, Orchids, Azaleas, Heaths, and almost every other article exhibited? As respects foreign visitors, I feel quite satisfied that they were as much pleased with the exhibition of Grapes as with that of Strawberries and Pine-apples. The show of fruit, as a whole, was, in my opinion, highly creditable to the gardeners of this country. *J. Mills, Loraine Cottage, Hammersmith.* "A. H." has charged the judges of fruit with profusely awarding prizes for unripe Grapes; and although in his second letter he modifies the hasty opinion he had previously expressed, still, as one of the judges, I consider it right to reply to him. He says, that when he penned his first letter he had not examined the programme of the exhibitions, and it appears to me that he had not done so even when he wrote his second, inasmuch as he therein states, that there is no longer any stipulation that the fruit shown shall be ripe; whereas it is distinctly laid down in the printed schedule that "all fruit must be sufficiently ripe for market." As regards the black Grapes, he considers that perhaps five medals would have been sufficient, while we, in what he terms our "abuse of the Society's liberality," awarded six! viz., three to private growers, and three to market gardeners; and so far were we from thinking we had been too liberal, that we regretted the rules laid down for our guidance precluded our granting anything to several other specimens of black Hamburgh of excellent quality, which we would gladly have rewarded had it been in our power. I deny that the white Frontignans, Sweetwaters, or Muscadines, which gained prizes, were unripe; they were well coloured, and, to our knowledge, extremely well flavoured, notwithstanding "A. H." appears to suppose that we did not taste them. With respect to the Muscats (apparently our most heinous offence), they certainly did not possess that rich golden colour, always to be wished for, but not frequently met with in that superb Grape; and on that account they attracted our particular attention; but after a careful examination of them, we did not think it a case that would justify us in taking on ourselves the invidious duty of depriving the exhibitors of the prizes which had been publicly offered by the Society. My brother judge and myself have each had more than 40 years' experience in the London fruit markets, and we were perfectly satisfied that the Muscats to which we awarded medals were "sufficiently ripe for market," and in better condition in every respect than can generally be purchased. "A. H." has fallen into the not unusual error of treating as an established fact, that which is merely his own surmise, inasmuch as he states that the judges "do not pronounce on the quality of a Melon without tasting it—why then do they give prizes to sour Grapes without tasting them?" Thus insinuating (though I cannot imagine on what grounds) that we awarded the prizes to sour Grapes without tasting them; but the fact was that we did taste the Grapes, and they were not sour. "A. H." charges us with inconsistency; but I think that charge may fairly be retorted on his proposal to discontinue giving prizes in May, when the production of first-rate fruit is extremely difficult, and increasing the rewards for it in July, when it can, of course, be procured in plenty at every fruit shop: surely such a system would not be carrying out the declared object of the Society, viz., the reward of horticultural skill. "A. H." writes of "*our* exhibitions," "*our* visitors," and "*our* show of fruit;" I therefore assume that he is connected with the Society, and if he possesses any influence in its direction, I venture to suggest to him, that if the Society would maintain its pre-eminence over rival establishments, it should increase rather than curtail its encouragement to horticulture, for at the present day it is only by the progressive development of liberal views that public support can be secured. *One of the Judges.*

*Orchid Shows.*—The two last shows at Chiswick and the Regent's Park confirm me in my opinion that it would be expedient that there should be some encouragement for the exhibition of smaller specimens of the rarer kinds of Orchidaceous plants, and if not for all of the rarer kinds, but for the encouragement of beginners in this branch of cultivation. Now I am not in the least inclined to deny the value of offering prizes for finely grown plants and large specimens. I fully believe that but for this great encouragement offered, both in the prizes and in the opportunity of our great gardeners gaining fame (for I will not believe that such cultivators as Mr. Mylam and Mr. Williams are solely stimulated by the value of the medal) have led to the wonderful specimens of good culture that every year's show produces. But as there is a feeling that only large plants covered with masses of flowers are fit to show, the result is, that the competition mainly lies between the few possessors of very large specimens, and the very same plants are produced year after year, though they are grown larger than the year before. Now I do not advocate the abandoning the existing prizes; I cannot but think, if there were also prizes given for smaller specimens of the rarer kinds, we should have a much greater variety of

* Replies to a number of questions, asked of the Editor of the *Gardeners' Chronicle*, will be found among the "Notices to Correspondents."

these interesting plants shown, and an encouragement afforded to collectors who are only just entering the field. Now as regards large specimens, a new collector, let him be ever so rich, cannot hope to rival the existing specimens of Mr Rucker, Mr. Warner, Mr. Hanbury, or Mrs. Lawrence. Now and then an occasion may happen, as at the recent sale, at Stevens's, of Mr. Blandy's plants, where large specimens may be procured; but it is not every one who can afford to give 60*l.* or 70*l.* for a good plant of Vanda Batemanni; and even if he did, he would not for some years overtake Mr. Rucker's noble tree, if I may so call it. It would be in vain, even with a very long purse, to ransack the great collections of Messrs. Rollisson and Messrs. Veitch for such specimens (with perhaps a few exceptions), as are produced at these great exhibitions. I am glad to see that you think the taste for the cultivation of this beautiful tribe of plants, is beginning to spread amongst the million. I feel certain, that with increased knowledge, and increased refinement of taste, these plants will become serious rivals to the Dahlias and Geraniums; and that before long, we shall see Dendrobium nobile carried about the streets as the Cactus speciosissimus now is. *Dodman.*

*Russian mode of Preserving Green Peas for winter use.*—The Peas to be preserved are chosen full grown, but before they become at all farinaceous; they are carefully shelled, and all damaged ones are picked out from the sound ones; the Peas are then thrown into water whilst boiling on the fire; the instant the water resumes the boil after immersion of the Peas, it is expeditiously strained off from them, the Peas are then immediately spread upon a cloth and turned over on it till all loose moisture has been soaked up; the Peas are then dried gently in the coolest part of a Russian oven-like fireplace. Green French Beans are dried in precisely the same manner, but the pods require to be cut into narrow strips previously to scalding them. Both green Peas and green French Beans dried are sold at a very moderate price at St. Petersburgh. When either of them is to be prepared for table they are soaked for a short time in lukewarm water, just enough to cover them, then gently stewed in it, with the addition of either gravy or a white sauce, and seasoned with sugar as well as salt and spices. Green Peas for winter use have been perfectly kept in England by simply bottling them like green Gooseberries, but much care is required in the process to avoid different sources of putrefaction, such as damaged Peas and moisture. Green French Beans may be preserved till winter by keeping them in brine just strong enough to float an egg; the Beans must be entire and without blemish. In preparing them for the table they should be washed in warm water; if then found salter than desirable, they should be soaked two or three hours in lukewarm water, before being put into that in which they are to be either boiled or stewed. Green Rye is also dried in Russia, is esteemed a great delicacy, and sells in St. Petersburgh for eight or ten times the price by weight of either green Peas or green Haricot dried. *M.*

*Hint to Advertisers* (See p. 358).—Allow me to thank your correspondent for his kind hint respecting the desirability of advertising my bedding plants early. It shall be duly attended to next spring season. *Edward P. Francis, Hertford.*

*Eucalypti.*—The notices of the young trees of this tribe growing in the open ground in Devonshire and elsewhere induce me to mention two luxuriant specimens that, for the last five or six years, have withstood some severe frosts, at Combe Royal, the seat of John Luscombe, Esq., near Kingsbridge, South Devon. The largest is upwards of 30 feet high, and has a stem nearly 3 feet in circumference. Specimens of the leaves are inclosed, as the writer desires to know if it is E. globulus, or not, as it was accidentally met with, and purchased without a name. The smaller leaves that accompany this communication are from a lower and more slender tree, about 20 feet high, which was bought as E. montana, having been raised from seed brought from Tasmania, by Mr. Backhouse; it is, however, quite distinct from the plant alluded to in your last number, which is growing in the private grounds of the Messrs. Veitch, at Exeter, the foliage of that plant being remarkably glaucous, and is moreover a strikingly ornamental tree, being every year covered with white flowers; whereas the plant at Combe Royal has never shown any disposition to bloom. *A Devonian.* [It is probable that the plant first named in this communication is E. globulus; but it would be necessary to see the flowers, in order to arrive at a satisfactory conclusion. The other cannot be determined without flowers. Mr. Veitch's plant is certainly the Van Diemen's Land Euc. coccifera. There is no such plant, that we know of, as E. montana.]

*Rough Plate Glass.*—In autumn I erected a cold pit, with four lights of rough plate glass. When I could safely put our half-hardy plants under a wall, I filled the pit with pots of Strawberries. I find that they have been scorched by the rays of the sun, and I am obliged to protect them as I should from any other kind of glass. *Charles Walford, Foxbro' Hall, near Woodbridge.* [We presume they were baked, not scorched.]

*Gorteria rigens.*—I would take this opportunity of mentioning that I have a tuft of the Gorteria rigens with more than 70 buds preparing to blow; nearly 40 of them are ready to expand when the first hot sun shines upon them. They are in the open ground, and sheltered occasionally in winter with a slight covering, when the weather threatened to be severe. Does this plant, with such a number of blooms, come often under your observation? [No.] *J. P.*

*Fly-papers.*—Your correspondent, "Curiosus," has, in his zeal to protect the "poor inventor of the fly-papers," not only "o'erstepped the modesty of nature" in attempting to prove too much, but he has put an interpretation on my remarks perfectly unwarrantable. So far from giving the poor inventor an "ignoble character," I volunteered the charitable belief that he was "ignorant" of the atrocious barbarities he was the author of, and hinted that if he were enlightened or made "wise" on the nature of the tortures he had invented, it would only add to his own. As these sentiments were dropped *en passant*, and savoured strongly of common humanity only, I am at a loss, and so must your general readers be, to imagine *why* "Curiosus" should feel so anxious to "endeavour to *reclaim the reputation of this fellow creature, and set him right in the scale of creation.*" Had I gone out of my way to injure him (I know him not, even by name), or indulged in any personality, it would have been another thing. "Curiosus" will please to bear in mind, that I *do* on every possible occasion "examine the mute vegetable kingdom," and that I am quite alive to the "glutinous excretions" he speaks of. I have often admired the wisdom of nature in their creation. These, however, let me kindly remark, do not at all bear upon the question at issue. If winged insects *are* secured, by the by, under such circumstances, they are speedily released by birds, spiders, and a variety of other animals; it being a wise law of nature *so* to destroy superfluities, and to send one animal to prey upon another. Let us consider *this* point settled. I will now, as the hot season is at hand, put in a word for the poor flies; and be the means, let me hope, of sparing some millions of them *unnecessary* torture. Killed let them be, by all means; but *not* first "put to the rack." Hearken all ye who patronise these fly-papers! Hear how they are made. The two compounds are, common resin and sweet oil; heated, amalgamated, and spread upon sheets of old newspapers. Thus are they "manufactured." Now for their "attractive" qualities. Wherever flies abound, *there* it has been deemed advisable to spread out these papers, one, two, three, or more. A little sifted loaf-sugar lightly sprinkled on them, completes the "charm." Let us note the result. In an instant some luckless fly descends, in search of a treat. He realises it, by finding either a leg or a wing fixed as in a vice. Escape is IMPOSSIBLE. The more he struggles, the worse the consequences. Here he must live, here he must fast, here he must linger, here he must "stick" and *groan*, till starvation and insect endurance can hold out no longer. Sometimes the poor flies are glued down by their hinder extremities, thus allowing freedom to their head and front legs, which, being elevated, give free play to their respiratory organs, and prolong life—to be *further tortured* by want of food. Every person possessing only common feelings of humanity, and who may be halting between two opinions, must feel greatly interested in putting my assertions to the proof. Let such carefully observe (whilst his thoughtless neighbour is spreading the snare), the almost supernatural endeavours of the poor flies, when inveigled by these diabolical papers, to extricate their feet from the rivets; and note how, in the vain effort, they tear out in their final agonies each several limb from its socket—their mis-shapen forms being elevated, after death, to thrice their natural height! The distinctly-audible vibrations of their wings in their last dying pangs, as they lie one glued to the other in countless numbers, complete this picture of newly-invented horrors (unfit even for Madame Tussaud's "Chamber")—a picture, alas, but too faithfully painted. These are simple "facts," which, by a few moments of close observation, *any body* may verify, by gazing on a well filled "sheet of flies." I have used the word "groan" with reference to their agonies; and if any of your readers have ever chanced to listen to the "horribly" peculiar sounds produced by the motion of the prisoners' quivering wings, either by day or by night (the latter especially), one moment's reflection will make them grateful that "Curiosus" should have unwittingly drawn forth this exposition from his obliged *collaborateur* in the field of Nature, *William Kidd, Newroad, Hammersmith. June* 19.

*Balsam Seed.*—In answer to "R. B.," p. 376, I beg to say that old Balsam seed is the best, and most likely to produce double flowers *J. R., June* 18.

*Preserving Fruits.*—I am happy that you have lately drawn public attention to the obscure but very interesting subject of preserving fruits fresh. In the present advanced state of organic chemistry, something may be expected of it, and it would well reward patient inquiry. It would appear that experiments were made in it by Couverschel, who employed nitrogen, and not, as you suggest, carbonic acid. They are mentioned by Müller in his "Chemistry of Vegetable Physiology," page 793. But other gases besides carbonic acid and nitrogen, and particularly ammoniacal and sulphurous acid, might be tried; and it seems almost unnecessary to add that temperature and light may be expected to exert important influences. Following up the controversy between Dr. Draper and Mr. Hunt, a very curious inquirer would even subject the experiment to the different rays of light (of the calorific and the colorific) alternately. The loss of flavour, I fear, will be one of the difficulties to be overcome; yet it must not be pronounced hopeless. If, as you state, the flavour in some degree returns to the fruit after an interval, it is difficult to say what might not be the effect of plunging it, after it had undergone the process, into oxygen. We know that oxygen restores the odour of essential oils, such as those of Lemon and the like, as your readers will find in Turner's Chemistry, page 1088. *A. C., Edinburgh.*

*Potato Disease.*—The following are a few particulars respecting the mode adopted in cultivating a crop of early Potatoes, and also regarding the progress of the disease with which they have been attacked, as far as I could obtain them from the gardener at a gentleman's place in this neighbourhood, which I visited the other day. Early in January a bed was made up of fermenting material, consisting of stable-dung of sufficient thickness to yield a gentle bottom-heat. The bed was covered with rather a rich black compost 6 inches in thickness. The Potatoes (good strong sets) were planted about 7 inches by 12 inches apart. The bed was then protected with strong boards nailed all round to about 18 inches above the soil, cross-bars were fastened over the bed to the side boards, so that the Potatoes could be protected from frost by a covering of mats. The plants came up well, were earthed up with a rich compost similar to that in which they had been planted, and they grew remarkably healthy and luxuriant till Saturday, April 19th, when the tops of the stems which touched the mats were slightly injured by frost penetrating the covering. In the following week, and about the 23d of the month, the gardener first observed dark blotches upon the axil of the leaves and stems. This gangrenous affection soon pervaded the whole of the stems. On or about the 5th of May digging was commenced, when one-half of the Potatoes was found very much diseased, and in the course of ten days more than two-thirds of the crops were quite unfit for use. On Wednesday last, when I saw the bed, scarcely a sound tuber could be found in the remaining part of the crop, the majority being in a putrid state, and the fœtid odour emitted from them could be recognised some yards from the frame. At a distance of 6 feet from the back of the above-mentioned bed on a south border in the open ground, are Potatoes of the same variety (Ash-leaf Kidney), and although the stems are only about 10 inches high, they are in several places very much affected, which would lead one to infer that, under favourable circumstances, the disease must be contagious. These Potatoes grew in a walled garden, rather low, lying about a quarter of a mile from the river Towy, and perhaps 30 feet above the level of the stream. The soil is very rich, and in both cases strong manure was used in planting. These conditions, acting in connexion, may to some extent account for the early appearance of the disease, as well as for its destructiveness. I have not heard of any other symptoms of disease having been noticed in this part of the country. My own frame Potatoes were never finer, and the garden and field crops look healthy. *Henry Bundy, Dynevor Castle, Llandilo.* [What else was to be expected, strong rank manure having been used?]

*Pear Tree Astyages.*—In reply to the inquiry of A. R. Hemmings on this subject, (p. 373), I am not aware that any peculiar remedy, beyond hand-picking, was applied to the Pear trees in the Horticultural Society's Gardens at Chickwick last year, whereby the numbers of this species has been so much diminished this season, which seems to me attributable rather to some natural cause, as I suggested in my paper on this species. The particular trees infested last year are, however, attacked this year by a much greater number of insect enemies than any of the other Pear trees in the Horticultural Gardens, and I believe there is some peculiarity in the border where they are planted which has affected them in some manner, and so rendered them more agreeable to the insects, as I believe it may be set down as a general rule that healthy trees or plants are much less subject to the attacks of insects than such as are in some way or other unhealthy, and hence probably the Pear trees of "A. R. H.," having been so recently planted, and not yet in full health, have been so infested. *J. O. W.*

*Fleming's Weed Destroyer.*—At the present time, when arts and manufactures are making rapid progress towards the utmost development of which they are susceptible, through the aid of machinery, it is gratifying to observe that distinguished horticulturists are endeavouring to benefit the gardening profession by means of the same great and all-powerful agency; and I am of opinion, that Mr. Fleming's laudable exertions in that direction, if not entitled to the warmest thanks of gardeners, are, at least, worthy of fair, candid, and impartial consideration. Mr. Bailey's communication of the 7th inst., however, certainly evinced a very different spirit. I could hardly have believed that any gardener would have sought to interpose obstacles in the way of the advancement of horticulture; but this, I think, Mr. Bailey has attempted to do. On Mr. B.'s own admission, there are more labourers employed at Trentham than in the majority of other places proportionately to their extent. There is, therefore, presumptive evidence to prove, without being fully cognisant of the matter, that the 80*l.* saved by machinery is expended in labour less detrimental to the operative than weeding. In this way both employers, gardeners, and labourers, may be benefited; the first, from having their gardens and grounds kept in a higher state of embellishment; the second, from deriving more satisfaction from their labour; and the last, from pursuing employments more conducive to their health. I visited Trentham myself since the machine has been used there, and I can bear testimony to the uninjured condition of the edgings, and to the high state of management observable in every department, all of which reflect the highest credit on Mr. Fleming; and I imagine, that if a similar system were pursued in other large establishments, the progress of horticulture would be more rapid, and the principles of the art more clearly

developed. *Fairplay.* [We have had other communications upon this subject; but we imagine that Mr. Bailey has by this time discovered his mistake, and therefore the discussion is better dropped.]

*Yellow Roses at the Chiswick Exhibition.*—We have been surprised to find that Mr. Francis, of Hertford, was awarded a prize at Chiswick, on the 7th inst., for six yellow Roses in a cut state, consisting of the following varieties: Williams' Double Yellow, Single Yellow, Banksian Yellow, Smith's Yellow, Harrisonii, and Elise Sauvage; for in 1849 we showed the finest varieties of yellow Roses perhaps ever exhibited in pots, and the judges disqualified us, condemning them as not being yellow. They consisted of the following sorts: Persian Yellow, Williams' Double Yellow, Banksian Yellow, Smith's Yellow, Harrisonii, and Tea Vicomtesse de Cazes. These six plants did not cost less than 18*l.* or 20*l.* to produce them. Of the value of the cut blooms we leave others to judge, remarking that it was from the circumstance of our being disqualified that we have not again attempted exhibiting Yellow Roses at the Horticultural Gardens. The Society's schedule appears to require Roses in pots being under that head. While on the subject of judging, may we enquire in regard to certain sized pots, whether they must be that exact size only, or not larger than that size; for we exhibited in May this year, Cinerarias in 6-inch pots, at Chiswick, acknowledged by the judges to be larger and finer than those exhibited in 8-inch pots by other exhibitors, and yet they were disqualified on account of the pots not being the proper size; but if we had dropped our 6-inch pots into 8-inch ones, and put a little Moss over them, we should not have been disqualified. We cannot, however, see what increased skill in cultivation there would have been in that, and therefore we beg that the judges will set us right on the subject. *E. Lane and Son, Great Berkhampstead.* [The size of pots, when mentioned in the schedule, must be attended to. If larger or smaller than is required the exhibition ought to be disqualified. If plants grown in 6-inch pots are merely transferred to 8-inch pots, they too would be disqualified.]

*Salting Gravel Walks.*—I use salt, not because it is cheaper (which it is), but because it does the work much better than hand weeding. It clears off the smallest weeds, Moss, &c., adds to the solidity of the walk, and if the operation is well done during dry weather in spring, it is done for the season. We only employ it on walks with Grass edgings, for it is as certain to kill Box as weeds. In using it, we sow it all over the walks, to within 6 inches of the edges, and then water, so as to dissolve the salt. Sufficient filters towards the edges to destroy all weeds. If done in rainy weather, it is liable to be washed from the walks, and do mischief. Old men, women, and boys can be better employed than in crawling on walks. That salting walks will help to fill the workhouse need not disturb Mr. Bailey. The gardener who would discharge labourers on this account, ought to have a place in the Crystal Palace beside the salting machine. *J. W. R.*

*Climate of Torquay.*—Permit me to call attention to some remarkable specimens of flowers and trees which were exhibited in the Crystal Palace on Saturday last. They consisted of the prize bouquet and other collections shown at the Torbay Horticultural Society's Exhibition as "Tender plants grown in the open air, and wholly unprotected during the preceding winter." Amongst them were branches of Olive from a wall tree 35 feet, and a standard 15 feet high; the Eucalyptus globosus or blue Gum-tree of Australia, of which you gave a drawing in a recent number; also Heliotrope, Petunia, Eccremocarpus, Bignonia, Acacia, Plumbago, Pelargoniums, &c., from plants which have withstood several winters. It appears from the observations which I have contributed to the reports of the Registrar-general, that the thermometer in ordinary years never falls below 28°, or rises, during the summer, above 76°, whilst in other parts of England the range exceeds this by 20° or 30°. In regard also to the humidity of the atmosphere, the remark of the Registrar-general, "That the counties of Devon and Cornwall are not only warmer, but the humidity of the air is less than in other parts of the country," is confirmed by every successive year's observations. Sir J. Clark adds, "Torquay is drier than the other places (on this coast), and almost free from fogs." *E. Vivian, Hon. Sec.*

*Asparagus.* — Is there any advantage in cutting Asparagus with the old-fashioned saw-knife? and is it right to cut off all the heads not wanted, or to let them grow? Some one mentions that cutting them down until the cutting season is over, which is the general custom here, weakens the plants. According to the advice of one of your correspondents, I dressed the half of my beds with a thick coating of salt in March; the consequence of which was that they did not shoot for three weeks after the others, and are not yet equally prolific with those not salted. I did not measure the quantity of salt but, as directed, put on enough to make the beds look as if it had snowed. *F. S. W., Bradley Wood.* [If you allow many of the young shoots to grow until you have done cutting, you will weaken the eatable shoots; a few, if your bed is weak, will do no harm. But when beds are weak, they should not be cut at all until they are stronger. If strong enough, every shoot may be cut, and that is the right way.]

## Societies.

Horticultural, *June* 17.—J. B. Gregg, Esq. in the chair. Lord Gardner, T. Lawford, jun., Esq., J. Rashleigh, Esq., H. St. John Mildmay, Esq., and Mr. Francis of Hertford, were elected Fellows.—Mr. May, gr. to E. Goodhart, Esq., Langley-park, Beckenham, Kent, sent a beautiful purple and white striped Phlox, called Mayii variegata. It is one of the prettiest we have seen of the many seedlings obtained from the Drummond Phlox crossed with other kinds; and if constant, will, no doubt, be an acquisition.—Mr. Mackintosh, Nurseryman, Maida-vale, Edgeware-road, furnished a small example of a white Chrysanthemum in blossom, in order to prove that this favourite autumnal flower may be made to bloom in the middle of summer. It was raised from a cutting put in in December last, and had been grown on a greenhouse shelf near the glass.—Mr. Chapman, gr. to J. B. Glegg, Esq., was awarded a Knightian medal for beautifully ripened Grosse Mignonne Peaches and scarlet Nectarines, and two dozen finely swelled and highly-coloured Elruge Nectarines, which received a Banksian Medal, were produced by Mr. Tillyard, gr. to Lord Southampton, at Whittlebury.—Mr. Cuthill, of Camberwell, obtained a Certificate of Merit for very fine fruit from the open ground, of his Black Prince Strawberry, a valuable sort, now becoming pretty well known. It is certainly the earliest and most prolific of Strawberries, yielding as it does a constant and plentiful supply of good fruit from this season up to the very latest period at which Strawberries can be gathered out of doors. A singular circumstance connected with this variety is, that blossoms have been detected on some of the plants exhibiting a beautiful crimson colour.—Melons came from Mr. Chapman, and Mr. Eckford, gr. to C. Child, Esq. The former sent two oblong fruit of the Sweet Melon of Cashmere, a white-fleshed sort of which little is at present known. It is, however, evidently related to the Persian kinds; it looked as if it would be very good. Mr. Eckford had two fruit of the Bromham Hall, one not externally different from it, named Brown's Green-fleshed, and two of the Trentham Hybrid. — From the Garden of the Society came the scarce Brassavola Digbyana, with a broad fringed lip; Cyrtochilum stellatum, having bright green healthy leaves, a rare occurrence with this plant; Cyrtoceras reflexum, Franciscea Hopeana, a profusely-flowered medium-sized bush of Pimelea decussata; Dillwynia clavata, one of the handsomest of the genus; an Epacris, two Cape Heaths, eight varieties of Achimenes, an Everlasting, and the Chinese Indigo plant, (Isatis indigotica).

Linnean, *June* 17.—The President in the chair. Dr. Adamson exhibited several fossil plants, in sandstone and lime-stone, from the Cape of Good Hope. A paper was read from Mr. B. Clarke, on the position of the raphe in anatropal ovules. The author observed that the position of the raphe in single ovules was very constant in many families of plants. He treated of the position of the raphe in six divisions; 1. In pendulous ovules with the raphe turned away from the placenta. This was seen in a large number of Endogens also in Ranunculaceæ, Piperaceæ, and in Araceæ and Piperaceæ; 2. Pendulous ovules with the raphe lateral, seen in Malpighiaceæ, Chenopodiaceæ, and several genera; 3. Pendulous ovules with the raphe next placenta. This is the ordinary position of the raphe in anatropal ovules. 4. In erect ovules, with raphe turned away from placenta, seen in Compositæ, in Penæa and Calythrix. 5. Erect ovules, with raphe lateral; very general in Exogens. 6. Erect ovules with raphe next placenta. The ordinary form in erect anatropal ovules. The paper concluded with some observations on the theory of the position of ovules. A letter was read from Thomas Forster, Esq., dated May 21, Bruges, "On the present season in relation to the migration of birds, and other natural phenomena. The author observed that there was always a great disproportion between the numbers of migratory birds that arrived as compared with those that went away, and that this disproportion was always greater in late springs, and specially after mild and damp winters. The swallow, sand-martin, and swift, had, this season, been very late in Belgium; and the house-martin *(Hirundo urbica)* had not yet appeared at all. Insects, which were usually common, were very scarce this spring; and the vegetable world had suffered generally, plants being later in flowering, and producing much fewer flowers. The month of April had been 8° Fah. below the usual average of temperature.

Entomological, *June* 2.—J. O. Westwood, Esq. F.L.S., President, in the chair. In addition to numerous donations of Entomological publications from the Natural History Societies of Moscow, Stettin, Munich, &c., a fine series of insects from the Cape of Good Hope was presented by Mr. Rooper, and a beautiful specimen of a hornet's nest by Mr. H. W. Newman, of Stroud. Mr. W. W. Saunders exhibited some beautiful Fulgoridæ from India, and also a very remarkable cocoon of open net work from Assam, together with the moth produced from it; Mr. Douglas, the singular cases formed of the flower-buds of Erigonum vulgare, by the larvæ of a small moth; Mr. I. F. Stephens, a new British Tenthredo (Selandria sericans of Hartig); Mr. Westwood, various insects which attack the leaves and young fruit of the Pear, at the present time, including both sexes of the beautiful Lyda fasciata, the pretty little Argyromyges scitella, (the larvæ of which form large blotches on the leaves at a later period of the year), various case-making caterpillars, &c.; Mr. Rich, some very splendid Goliath beetles, and other coleoptera from West Africa; Mr. Robert Ellis, some curious cases found upon and formed of the leaves of the Oak, being the nests of some species of Attelabidæ, and other leaves rolled up by the larvæ, apparently, of Tortrix viridana; Mr. Edwin Shepherd, a very strange variety of Vanessa Io, with the margins of the wings white; Mr. Preston, an equally curious variety of the orange tip butterfly with the green markings of the hind wings obliterated; Mr. A. Shepherd, a specimen of Smerinthus populi, with an appendage on one side of the body, somewhat like a fifth rudimental wing; Mr. Stainton, some cases formed entirely of lichen by the larvæ of a small species of moth; Mr. S. Stevens, two new British species of Curculionidæ, one of them belonging to the genus Mecinus found on the Plantago maritima, near Gravesend, and a new species of Elateridæ, found on the Oak, also a series of very beautiful lepidoptera, recently received from Quito, including some very rare species, and apparently a new Papilio allied to the singular P. Zagreus; and Mr. Weaver, specimens of Fidonia carbonaria, from Perthshire. Mr. S. Stevens communicated a notice of the capture of Gastropacha ilicifolia, a large moth, new to this country, on Cannock Chase, in Staffordshire, by Mr. Atkinson. A memoir on the economy of various species of Bombus, by Mr. H. W. Newman, together with supplementary notices by Mr. F. Smith, was read: likewise, some notes on a specimen of Goliathus cacicus by Mr. Rich, who had kept it alive five months; and a supplementary monograph on the Evaniidæ by Mr. Westwood. It was announced that a new part of the Transactions, vol. 1, N.S., part 5, was ready for distribution among the members.

## Notices of Books.

*Observations on the Culture of Roses in Pots.* By William Paul; second edition, pp. 43. Piper, London.

Beginners, in this kind of cultivation, will find this a most useful pamphlet, and it may doubtless be read with advantage by persons even experienced in the art. The excellence of Mr. Paul's Roses, in pots, at our great metropolitan exhibitions, forms, perhaps, the best guarantee that could be offered of his ability to teach; and those who would wish to obtain similar results, cannot do better than follow his instructions implicitly. A few woodcuts, illustrative of training and pruning, have been introduced into this edition, which, altogether, must be considered a very cheap shilling's worth. We heartily recommend it to the notice of all cultivators of the "Queen of Flowers."

## Garden Memoranda.

Botanic Garden, Chelsea.—The alterations commenced in this ancient garden, some three or four years since by Mr. Fortune, have been completed; they consisted chiefly in the clearing out of overgrown and unimportant plants, breaking up the formal arrangement of the hardy plants, converting the greater part of the surface into lawn, on which the herbaceous and other hardy species were planted in irregular beds, according to their natural orders, and erecting a new stove 60 feet by 20, and a greenhouse 40 feet by 20. These structures are very well adapted for plants, being low, span-roofed, and light; they are close glazed with rough plate glass. The stove is heated by hot-water; and is perhaps only deficient in not having any provision to supply bottom heat to the plants—a circumstance of the more importance in consequence of the miscellaneous character of a botanic garden collection. We noticed in the stoves good plants of the Upas tree (Antiaris toxicaria), the Allspice (Eugenia Pimenta), the Cinnamon (Cinnamomum zeylanicum), the Chu-lan (Chloranthus inconspicuus), used medicinally in China, as well as employed in scenting some of the perfumed teas. A good example of the very curious and really ornamental Ruibarbo (Jatropha podagrica), had been flowering for some months past. There is a fine old plant of Zamia elegans; and we noticed a small species of Zamia, called furfuracea, a dwarf branching stemmed kind, from which arrow-root of the best quality is sometimes obtained. A small house full of Aloes, Gasterias, and allied plants, was tolerably gay, with flowering examples of this now neglected race, many of which deserve to be more generally cultivated for their interesting and distinct exotic aspect no less than for their freely-produced and very ornamental blossoms. In the open air, one of the most interesting plants we saw was a large old specimen of one of the shrubby spiny branched Tragacanths, here called Astragalus pseudo-tragacantha, the plant having lately been exposed by the clearing away of some old rubbishing "rockwork." Fabiana imbricata was flowering very freely, trained on the outside of one of the greenhouses, and is here found to be quite hardy, and very ornamental at all seasons. The lions of the garden, the "old" Cedars, are, we are sorry to see, rapidly decaying; and indeed the out-door plants generally give evidence of having to struggle against a very ungenial atmosphere, which we understand is daily becoming more smoke-polluted. Though so near the Thames, the plants here suffer much from drought, the subsoil being a sand-bank, and the surface-soil exhausted. More efficient means of irrigation seem to be much required. We must not omit to mention some of the noble species of Ferula, or Giant Fennels, which seem to flourish in the dry subsoil which they here find. Two of these species are now coming into flower.

## Miscellaneous.

*Sale of Orchids.*—A small collection from New Granada, was sold by Mr. Stevens the other day, at the following prices:—Uropedium Lindenii from 2*l.* 12*s.*6*d.* to 5*l.*; Oncidium candelabrum, from 3*l.* to 4*l.*; Odon-

toglossum hastilabium, 3*l.* 15*s.*; O. nævium, from 1*l.* 12*s.* to 3*l.* 15*s.*; O. Pescatorei, from 1*l.* to 3*l.* 5*s.*; Cycnoches Pescatorei, 2*l.* 10*s.*; C. Lindleyi, 1*l.* 10*s.*; Angulos virginalis, from 2*l.* to 3*l.* 5*s.*; Myanthus sanguineus, 2*l.* 12*s.* 6*d.*; Paphinia, tigrina 2*l.* 12*s.* 6*d.*; other lots, of which there were in all 193, fetched from 1*l.* to 2*l.* per lot.

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

THE daylight and sunshine having now arrived at their climax for this season, stove plants, which are in a growing state, should be supplied with the maximum amount of heat and moisture, that they may the sooner complete their growth, and have a longer period to ripen it in. Water should be freely and frequently sprinkled on every evaporating surface, with a view to counteract the drying effects of the abundant ventilation, so indispensable in hot weather. Houses which are not so situated as to receive the first rays of the morning sun should be assisted with fire-heat, if necessary, early in the day, that the plants may enjoy the benefit of a high temperature in conjunction with the strong daylight of these summer mornings. Incessant exertions must be made to keep insects in check, particularly red spider; syringing and washing the walls and hot-water pipes with lime and sulphur will have the desired effect, if perseveringly proceeded with. The flowering season of many plants may be retarded by pinching off the earliest flowers, thereby husbanding their strength, and inducing them to make a longer season of growth; the latter object may be assisted by means of liquid manure. Forcing-pits should now be actively employed in forwarding Achimenes, Gloxinias, Balsams, Cockscombs, Globe Amaranths, and other plants, for immediate autumnal display. Shading and ventilation must now be attended to with watchful anxiety, taking care, however, not to habituate the plants to an excess of the former, as it is only necessary in strong sunshine.

FORCING DEPARTMENT.

PINERIES.—When the bottom-heat is declining, it may be recruited by surfacing the beds with a few inches of new tan; as, independently of its own fermentive power, it absorbs a considerable quantity of heat from the sun, and attracts the roots to the surface, where they revel amongst the new materials. In addition to these advantages, it checks evaporation, economises labour in watering, and keeps the roots in a more equable state of moisture during hot weather. VINERIES.—Let the late Vines be supplied with a sufficient amount of heat and moisture to keep them growing at a healthy rate; and do not be fearful of the Grapes ripening too early, as, by the retarding process, nothing is gained except ill-flavoured, badly-coloured berries. Grapes intended to be kept through the winter should be perfectly ripe by the middle of September; and as it is important to the flavour that the ripening process should be gradual, let them be grown briskly till they are beginning to change colour, and then by giving plenty of air, accompanied by heat, they will ripen thoroughly, and hang along upon the Vines without shrivelling. PEACH-HOUSE.—Continue to keep insects in check, using the syringe freely to keep down the red spider, and tobacco smoke to destroy thrips. The foliage must be kept healthy, to ensure success in the crops of this and future seasons. Should mildew make its appearance in the late house, dust the plants with sulphur immediately. MELONS.—Keep up the top temperature, and a bottom-heat of 85°, with a moderately moist atmosphere to the successional plants, and give occasional waterings.

FLOWER GARDEN AND SHRUBBERIES.

The most pressing work at present is that of keeping the place in order. A little pains taken with the walks at this season will be amply repaid by the air of comfort and pleasure which well-kept walks give to any place. The old surface should be loosened a little with a sharp rake, and then receive a slight sprinkling of fresh clean gravel; the best time for the operation is when they are in a medium state between wet and dry, as the roller is then more effective in restoring the hard smooth surface than when the gravel is too dry. In connection with the repairs of the walks, any irregularities in the edges should be put right, and the edgings, whether of Grass or Box, or other evergreen, should be repaired or clipped. This may appear to some to be an unseasonable time for such work; but where it can be done, the effect produced amply repays for the trouble; and in flower gardens effect is everything. This is the best time of all to clip evergreen hedges or edgings, as they have time to make and mature a new growth, while the season is far enough advanced to prevent their growing very materially out of shape. Watch the different annuals as they come into flower, and mark those varieties whose superior habit of growth, size of flower, or brilliancy of colour, make it desirable to procure seed from them; and that these good qualities may be perpetuated in their progeny, destroy inferior ones as soon as they expand their first flower.

FLORISTS' FLOWERS.

Carefully tie any Pinks, which it is desirable to retain in form—when this precaution is not taken, they are apt to burst, and if wanted for exhibition are then disqualified. Some varieties, especially north-country flowers, will bloom without; preparations may be made for piping, a very gentle hot-bed is the best to put them on, though they will strike very well in sandy compost, on a north border, provided they are covered with a hand-glass. Some florists layer the first shoots, but these plants are not so handsome as those struck from cuttings. If any Tulip flowers have been impregnated during their bloom, it will be advisable to cover the capsule or seed vessel, as moisture will often cause it to root: a stick, having a notch sawn in it, so that a piece of flat glass may be inserted, is, perhaps, the best contrivance; by placing it immediately over the seed vessel, wet is avoided, whilst the sun and air exert their influence on it. Tie Carnations as they spindle; this must be done gradually. Should very hot weather occur, careful watering must be resorted to: for should the plants get a check now, it will very materially affect their future well-doing. Dahlias will also require water for the same reason; these plants will do better with more moisture than is usually given them.

HARDY FRUIT GARDEN.

Pyramidal fruit trees, or trees trained to any other form, should have the gross shoots frequently stopped, to prevent the weaker parts of the tree from being injured, and to encourage a more equable diffusion of the sap to every part. Tying in young shoots, where required to fill up vacant spaces, and checking excessive growth, where wood is unnecessary, will demand our attention during the next two months; and if this is well attended to, little or no pruning will be required in the winter. Trees that appear too vigorous, may, with safety, be root-pruned, any time during the next month, and this will immediately ensure a fruitful habit. These directions will apply to wall trees, as well as to standards in open situations.

KITCHEN GARDEN.

Successions of the Brassica family may be planted upon land which has already been cleared of its former occupants, or intermediately amongst other crops, which will shortly be removed, provided that the ground had been well manured previously. Another sowing of Peas should be made; and the last in about 10 days after. Sow Cabbage for Coleworts, Endive for main crop, and make the usual sowings of Radishes, Turnips, Lettuces, Chervil, &c. Attention should be paid to the earthing up of Potatoes, using the three-pronged hack instead of the sharp draw-hoe, which it is a common practice to use, although very liable to cut off the young strings which lie near the surface of the ground. The soil for earthing should be drawn from the centre of the space between the ridges. The earliest crop of Celery now requires partially earthing up; and as this is intended for immediate use, it should be earthed up by degrees, as the growth of the plant renders it necessary. Carrots, Parsnips, &c., should be thinned, the perfection of such plants greatly depending on the space allotted to them individually.

State of the Weather near London, for the week ending June 19, 1851, as observed at the Horticultural Garden, Chiswick.

| June. | Moon's Age. | Barometer. | | Temperature. Of the Air. | | | Of the Earth | | Wind. | Rain. |

The highest temperature during the above period occurred on the 27th, 1826—therm. 93 deg.; and the lowest on the 25th, 1835—therm. 37 deg.

## Notices to Correspondents.

BEEHIVES: *G Neighbour, M Hays*, and others. We must reserve our opinion of the hives in the Crystal Palace until after the jury has published its decision—after which we shall examine the matter for ourselves—fully—and, we hope, to the satisfaction of the public.

BIRDS: *F M.* It will be some weeks before the treatise on the "Linnet" appears. Meantime, if you wish to rear young birds from the nest, feed them every half hour (while very young) with scalded rape seed, bruised; yolk of hard-boiled egg; and a small quantity of the crumb of stale roll,—the whole moistened and formed into a thinnish paste. The point of a wooden skewer is the most eligible instrument to feed them with. *W K.—C L.* The "stone-runner" is, in our southern parts, known as the "stone-chat." It is a tender summer warbler, and sings sweetly when at liberty. It is impatient of confinement, and would die if caged. It is a "bird of passage." The "Reed Sparrow" is also so called by us. It is a very prettily-marked bird, with a pleasing chattering note. It is migratory, but never leaves this country. In an aviary it is a showy, gay bird; but is not suited to a cage. The "Hocker" and the "Kip" are names, I imagine, peculiar to Romney; we do not recognise any birds here so called. *W. K.—"Cage."* The description given by our fair correspondent, of the bird "frequenting the running stream of water," puzzles us greatly. The size and shape; the colours of the breast and wings (orange brown); the top of the head, white; and habits, shy,—are perplexing. From the rapidity of its motion, it must be of the genus *motacilla*; but "singing" as it does so sweetly, it cannot belong to the race of wagtails. Its nest, too, being constructed, and its young reared "in an old building," perplexes still more. It must surely be peculiar to Wales only, where its habits and qualities appear to be so well known. We should much like to possess one of this family of very beautiful and *most* curious birds,—alive, of course. *W. K. —Diana W.* Your little favourite canary has the "surfeit," You have been too liberal with your unripe green food; or have been purchasing *old* bad seed. The acidity caused thereby has eaten away the feathers from its head. Wash the bald part with a strong brine of common salt and cold spring water. Dry it; and when dry, anoint it with fresh butter or hogs' lard. Repeat both operations daily for a week, and the disorder will be cured. The feathers will reappear,—if not immediately, when your bird moults. Perhaps in a week or two. *W. K.*

BOOKS: *G Porter.* A new edition of Liebig's "Letters on Chemistry" has just appeared, and wholly supersedes the last edition.—*S S.* By all means procure "Babington's Manual," 3d edition, if you are studying British plants.—*R L., Manchester.* Dr. Royle's very important work on Cotton will be noticed fully the moment we can find space.

CUCUMBERS: *A P.* A curious monstrosity, but nearly rotten when it reached us. Concerning the Laburnum, see p. 360 of the present year.‡

GREENHOUSES: *B H C.* Employ an honest tradesman, and allow him a fair profit. Use Hartley's Rough Plate Glass. If your operation is a small one, and you can obtain a plan, your village carpenter would execute it. That is the cheapest way to build a greenhouse. If, however, your operation is a large one, you had better obtain tenders from some of the respectable firms who advertise in our columns.

HERBARIA: *L N R.* There is no such work. Saturate spirits of wine with corrosive sublimate, and then dissolve the saturated solution in an equal quantity of fresh spirit.

INSECTS: *Sub.* We could discover no insects on your Melon leaf, the discoloured patches on which do not appear to us to have resulted from the bites of insects. *W.—C G.* The insects on your Geranium leaves are aphides. Envelope the plant in a cotton bag (an old pillow-case will do, if large enough), and fumigate it with tobacco smoke. *W.—Victim.* The worm-like insects from your flower border are the immature state of some kind of two-winged fly. Turn up the ground and water it well with a decoction of Quassia, Wormwood, or lime and soot. If you will take the trouble to read the two articles headed "What is an Insect?" which appeared in our pages at the beginning of the present year, you will see that woodlice do not undergo the same changes as beetles or butterflies, but simply increase in size without altering their form. *W.*

MOWING MACHINES: *W W R P.* That most in favour now is Shanks's, worked by a pony. Budding's is smaller and less efficient, but it pleases the owners of little lawns.

NAMES OF PLANTS: *W S.* Philadelphus coronarius, the common Syringa.—*F B.* Scilla Peruviana.—*L N R.* 1, Polystichum aculeatum; 2, P. lobatum; 3, Lastrea spinulosa. *S.*—*J B S L.* It is not a Fern at all, but a tuft of leaves like those of common Burnet.—*G Y.* 1, Valantia cruciata; 2, Polygala vulgaris.—*G F.* Carexes are neither horticultural nor agricultural productions, and we cannot undertake to name them. Consult "Babington's Manual of British Botany," new edition.—*A B C.* 10, Dactylis glomerata; 6, Lolium perenne; 7, Looks like a bit of Lolium italicum; 12, Cynosurus cristatus; 11, Alopecurus agrestis; 2, Poa trivialis; 3, Poa pratensis; 1, Bromus sterilis; 8, Holcus lanatus; 9, Bromus mollis.—A few inquiries stand over for further consideration.

PEARS; *K.* We imagine your unhappy Pears to have been frozen when partly swelled. Perhaps they were exposed to a snow storm, in that state, or were frozen while wet. There does not seem to be any constitutional injury.

PELARGONIUMS: *Barbara.* You cannot do better than select from the lists of these flowers given in our recent reports of the different metropolitan exhibitions, where all the best kinds are produced.*

PRICES OF PLANTS: *Y Z.* We cannot possibly report the prices obtained for plants in private trade. If you try the experiment of dealing in plants you will soon discover that it is not a very profitable occupation. If you have a cottage, a bit of land, and 70*l.* a-year, you would be insane to exchange such a position for the hazardous trade of a small nurseryman. Your letter reminds us of the pedlar in the "Arabian Nights," who kicked over his hawker's basket of glass, all he possessed, while he was indulging in visions of wealth to be gained by becoming a merchant.

ROSES: *A T.* We do not think it will answer to send cut Roses to Chiswick from Derby. The Horticultural Society will not undertake to stage them ‡—*M D* next week.

TROPÆOLUM DECKEBANUM: *C A.* Treat it as you would T. tricolorum.‡

TUBEROSES: *T.* The best soil for these is light sandy earth, mixed with one-third part very rotten cow-dung. About the middle of April prepare your bed by clearing it out to the depth of 3 feet, and fill it nearly to the top with fresh stable dung that has been cast into a heap to heat a fortnight before, treading it firmly. Upon this lay 18 inches in depth of compost, sloping it to the south. In a day or two after, plant your roots 5 inches distant from each other, just covering the tubers with earth. Shut up the bed at night, especially if frosty; or if in the open air cover it with a double mat till the leaves appear; but give little or no water, and protect it from heavy rains. When the leaves have grown about an inch long, add a little compost to the surface. If the season prove dry your bed will now require watering, and towards the end of June and in July, when the leaves are in full vigour, very copiously; from this period till the beginning of winter nothing more is necessary. About the first week in December thatch the bed over with dry straw, if in the open air; and about the middle of February, if not prevented by frost, take up the roots, preserving the fibres, and pack them in very dry sand in cellars till April, when they must be replanted as before. The taking up disposes them to form their flower-stems earlier. Offsets will by this time have made their appearance round each root and must be removed. This second year some of the largest roots will probably flower, and if early, they may be allowed to blossom in the open air; but if later than July, they should be potted and placed under glass. Such is an outline of the general management of Tuberoses in the open air or in a frame; but for particulars we recommend you to read the excellent paper on this subject, published at page 101 of our volume for 1847.‡

VINES: *A H.* Luxuriant growth and a damp atmosphere have caused the small green excrescences, which have alarmed you, to appear on your Vine leaves. They will do no harm.‡

## SEEDLING FLOWERS.

ACHIMENES: *Huddersfield.* So badly packed in cotton wool that it is impossible to say what its properties are. The colour, however, is good.*

CACTI: *J A P.* A nice medium-sized flower of good colour.*—*S B W.* A large and handsome variety; deep orange shaded with violet. Well worth cultivating.*

CALCEOLARIAS: *W S.* Nice flowers, but no improvement on kinds already out.*—*Flora.* When your blooms reached us they were in the condition of dried specimens. They appear to be good in colour, and, as far as we can judge, well shaped.*—*G A.* Useful sorts, but not good enough for "show flowers."*

CINERARIAS: *B S.* All inferior to the best kinds now in cultivation.*—*W S.* A good blue, but too small.*

ERRATA: In Mr. John Hayes' advertisement, inserted last Saturday for "send by post," read "sent out of pots."—In the advertisement of the list of prizes awarded at the Horticultural Society's meeting, on the 7th inst., Mr. Cox is placed both 2d and 3d for white Frontignan Grapes. It should have been—1st, Mr. Bain; 2d, Mr. Cox; 3d, Mr. Smith, gr. to G. Elliott, Esq., Binfield, Berkshire,

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—WINDSOR MEETING, 1851.
PROGRAMME.

FRIDAY, JULY 11.—Cattle received into the Show Yard, in the Home Park, from Eight o'clock in the Morning until Eight at Night.

SATURDAY, JULY 12.—The Show Yard open for receiving Cattle from Eight o'clock in the morning until Four in the afternoon; after which latter hour no Stock will be received.

MONDAY, JULY 14.—The Judges will enter the Show Yard at Nine in the morning, and commence their examination of the Stock.—In the afternoon, or evening, when the Judges have delivered in all their awards, Members of Council and Governors of the Society will be admitted into the Show Yard, on the payment of Two Shillings and Sixpence each, and the public at Ten Shillings each.

TUESDAY, JULY 15.—The Show Yard open to the public from Six o'clock in the morning until sunset, at Five Shillings for each person.

WEDNESDAY, JULY 16.—The Show Yard open to the public from Six o'clock in the morning until sunset, at Two Shillings and Sixpence each person.—The Great Dinner of the Society in the Pavilion, at Four o'clock in the afternoon.

THURSDAY, JULY 17.—The Show Yard open to the public from Six o'clock in the morning until Eight at night, at One Shilling for each person.—At Nine o'clock, P.M., the Cattle may be removed from the Show Yard.

FRIDAY, JULY 18.—The General Meeting of the Society, in the Guildhall, at Ten o'clock in the forenoon.

The Show Yard and Pavilion are situate, by the gracious permission of Her Majesty and His Royal Highness Prince Albert, in the Home Park, immediately below the slopes and terraces of the north front of Windsor Castle.

*President*, His Grace the DUKE OF RICHMOND, K.G.

*Stewards of Departments:*

| | |
|---|---|
| Cattle ... ... ... | Mr. Stokes, Mr. Jonas, Mr. Milward. |
| Finance ... ... ... | Colonel Challoner, Colonel Austen. |
| Sale of Tickets ... ... | Mr. Wilson, of Stowlangtoft. |
| Receipts and Admission to Show Yard. | Mr. Raymond Barker. |

By Order of the Council,
London, June 11, 1851. JAMES HUDSON, Secretary.

By the Regulations of the Society, all persons admitted into the Show Yard, or other places in the temporary occupation of the Society during the Meeting, shall be subject to the Rules, Orders, and Regulations of the Council.

PAVILION DINNER TICKETS.—Members may obtain their Tickets for the Pavilion Dinner by enclosing a Post-office order for Ten Shillings to the Secretary of the Society, at No. 12, Hanover-square, London, between the 20th of June and the 5th of July. The Tickets will be forwarded by return of post, in the order of application; and should any remain unclaimed they will be sold at the Finance Rooms, within the Society's Enclosure in the Home Park, on the Monday, Tuesday, and Wednesday of the week of meeting, until disposed of. Each of these Dinner Tickets also entitles the holder to a pint of port or sherry.

SUBSCRIPTIONS.—For the convenience of Members attending the Meeting, the Finance Committee will, in the same Rooms, also receive any Subscriptions that may be due from Members to the Society.

MR. J. C. NESBIT, F.C.S., F.G.S., Consulting and Analytical Chemist, Laboratories, 38, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by Dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | |
|---|---|
| Clover Manure, per ton ... ... ... ... | £11 0 0 |
| Turnip Manure, do. ... ... ... ... | 7 0 0 |
| Superphosphate of Lime ... ... ... | 7 0 0 |
| Sulphuric Acid and Coprolites ... ... | 5 0 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

SHALE MANURE.—The Bituminous Shale Company can now supply Pulverised Shale Ashes in sacks at 2l. 10s. per ton, delivered at any station or branch line of the South-Western Railway, and at the Terminus, Nine Elms.

This valuable Manure is at once cheap, durable, and fertilising, and will be found to be superior to all others for Grain, Grass, and Root crops.

A singular property of this Manure is that it entirely prevents the ravages of the Fly in Turnips and Hops; it is also utterly destructive of the Wire worm.

Orders to be addressed to the Bituminous Shale Company, 145, Upper Thames-Street, London, where also testimonials from the first agriculturists of the day may be obtained.

ALGERNON POLLOCK, Secretary.

HOSE FOR LIQUID MANURE, Fire-engines, and agricultural purposes, made of canvass, lined and coated with gutta purcha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure; it is extensively used at the Government public works, also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

ANTHONY'S PATENT AMERICAN CHURN has obtained a Prize at every Agricultural meeting at which it has been exhibited; and the Proprietors have sold upwards of 2000 in one year, and received from all parts of England the highest testimonials in its favour both as to the short time required, the quantity and quality of the Butter made, a copy of which testimonials, with prices, will be forwarded on application to BURGESS and KEY, 103, Newgate-street, Sole Agents to the Proprietor.

HOSE! HOSE!! HOSE!!! Improved Canvas Hose, Lined and Coated with Gutta Percha for Liquid Manure, Fire Engines, Garden and Farm purposes. — The rigidity of seam avoided, the flexibility increased, and the pliancy that of a lady's glove. A new material will be ready this week for ¾-inch Hose for Garden purposes, of a very superior description to any yet seen. The Improved Gutta Percha Union Joints are much approved of, and all sizes can now be had.—Apply to Messrs. MITCHELL and Co., 93, High Holborn, London; International Depot for Patented and other Inventions.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.

HENRY KER SEYMER, Esq., M.P., Chairman.
JOHN VILLIERS SHELLEY, Esq., Deputy Chairman.

Empowered by Act of Parliament to execute all works of drainage (including outfalls through adjoining estates), to erect farm buildings, and carry out every kind of permanent improvement upon estates under settlement; to provide the money, or to enable the landowner to employ his own capital and execute the works by his agents, and to secure repayment of the outlay by a charge on the property improved, spread over a number of years. Applications to be addressed to Offices, 52, Parliament-street, London. W. CLIFFORD, Sec.

**The Agricultural Gazette.**

MEETINGS FOR THE TWO FOLLOWING WEEKS.

| | | |
|---|---|---|
| WEDNESDAY, June | 25 | Agricultural Society of England. |
| THURSDAY, — | 26 | Agricultural Imp. Soc. of Ireland. |
| WEDNESDAY, July | 2 | Agricultural Society of England. |
| THURSDAY, — | 3 | Agricultural Imp. Soc. of Ireland. |

THE subject of CULTIVATION BY STEAM seems to hang fire. Not for want of thought upon the topic; for there are many minds full of thought about it, and few people now-a-days believe the thing impossible: indeed no one can find any good reason why it should be so. There is no particular difficulty or peculiarity about the mechanism of cultivation, to "forbid the banns" between the soil and the steam-engine; and a recent passage of the *Times* (in noticing the husbandry implements in the Great Exhibition) assures the world pretty boldly that the match will take place some day, slow and unpromising as the courtship may seem at present. We join hands in this belief; and in the meantime invite the attention of our readers to some preliminary points which may help a little to account for past delay, and possibly to advance the question a step or two from its present silent condition. *Silent*, because invention is apt to be so. Self-interest keeps it so; and in the mean time a generation may pass by, and nothing be practically done towards a consummation which, once attained, it requires no ghost to see that Great Britain would leap a-head in agriculture as much as her mines of coal and iron, and her still deeper and richer mine of mechanical skill and improvement, have led her to do in every art and manufacture upon which the breath of Steam *has* been brought to bear.

Here lies the grand motive in the matter; and one so emphatically important in reference to this particular application of steam-power—yet to be achieved—that one cannot help wishing that all who really think at all about it—who are not of that class of infidels who think the womb of invention is age-stricken, and that nothing is possible but what *has been* done—would come into committee upon the subject, and abating a little of that exclusive faith which each has in his own cleverness and chance, would help to bring in this tide, as the tide of human progress is wont to come in—not by one great wave, all at once, but by a great many waves after and upon each other.

There is one grain of comfort, and of corresponding hope, visible already. The *Times* has got quit of the steam-*plough*, and got as far as the *spade:* that is something. We speak, of course, with the intensest deference of our great contemporary, merely venturing our kite-string into his thunder-cloud, to catch an electric spark or so of intelligence as to the *status quo* of the public mind, which nothing can, especially in such a case, more powerfully represent. It is something, we repeat, to have got to the Spade; for those who have got thus far will not stay long there. The public mind moves slowly; but once in motion, the *inertia* once shaken off, and the *vis inertiæ* once aroused, it will never stop till it reaches the goal.

Again and again be it repeated, that it is not *ploughing*, neither is it *digging*, that we want. These are only *means*. What we want is the *end:* we care not for the process. Give us A SEED-BED: shew us the soil *comminuted*, *aërated*, and *inverted*, 6 or 8 inches deep, and we will not ask you *how it came so*. What does that matter? If you wanted your coffee ground for breakfast, to a certain fineness of texture, would you be very particular to ask whether the mill that crushed the fragrant berry had worked by horizontal, vertical, alternate, elbow-crank, or by circular motion? If the farmer or the gardener could only have his seed-bed made ready for him as fine as a new mole-heap, or to any other coarser texture, according as he wants it, what would he care whether the soil had been first cut into longitudinal strips, plough-fashion, or into flattened cubes, spade-fashion, before it was finally granulated for his use? Surely the one is as indifferent as the other; and singularly enough, both offer problems far more difficult to the steam-engine (if any thing can be called so), than the performance at once of the ultimate and entire process without these preliminary forms at all.

Until steam-power was discovered this possibility did not exist. Wind and water-power being out of the question, there remained nothing for it—no *other* power that could be taken to the field—but men or horses. Ploughing or digging then were the indispensable preliminaries; there was no getting on without them; they were but preliminaries, it is true, the former leaving everything, the latter a great deal (according as the work was done) to be accomplished afterwards to complete the cultivation.

But it is not so now. Since the birth of the steam-engine—no such very long time ago—the whole elements of the question are altered. There exists *now* a portable power—not limited to horizontal action like the horse, nor to vertical action like a man using the spade or hoe,—which if merely told *what to do* will go and do it, merely dropping a hint into your ear that *circular* motion is its favourite.

But the willing giant stands idly panting and smoking: for nobody can agree to tell him what to do. One says, "go and *plough!*" another says, "go and *dig*," each mistaking the means for the end, and trying to yoke this youngest born of human genius to the peddling routine of manual or equine capacity, out of the very perversity of backsightedness that clings to forms and modes which belonged to the *implements* not to the *task*—backsightedness that would with equal reason puzzle its brains in looking for the pole and splinter-bar of a locomotive, the pendulum of a watch, or the paddle-boxes of a screw-steamer.

But if it is not ploughing, and it is not digging, what is it? "Go to the mole thou dullard" (the old proverb might be travestied), consider her *ways* and be wise—who without any coulter, share, or mould-board, without spade, hoe, or pickaxe, leaves behind her in her rapid track a finer mould than ever RANSOME, HOWARD, or CROSSKILL—than ever spade or rake produced, or the most careful-handed gardener used, to pot his plants with. The very rabbit that scratches his hole in the ground, or the fox that scratches after him—like a king-crab, to *eat the kernel and lie in the shell*—or the dog that scratches after both—the whole tribe of 'claw-foot' in fact—had scratched hard earth into soft mould, before ever the plough or the spade, or even the more ancient hoe, had broken ground on this planet.

Let us begin from the beginning: let us take 'Cultivation' itself into thought for a serious moment, and analyse it into its simplest elements, dropping all conventionalities of plodding custom. What is it? How would you do it, if you had neither plough nor spade nor hoe nor rake to help you? Surely with the same tool that the Monks of La Trappe used, to dig their graves, and in like manner! If the mole, the rabbit, the fox, the dog, are not sufficient indicators, take the hand of man, glove it with hardened steel, multiply it a dozen or twenty times, till you have an instrument as broad as CROSSKILL'S clod-crusher, each hand or claw with its separate arm forming the radius from a central shaft, which bristles all around with a forest of such arms, a sort of revolving BRIAREUS, *not rolling*—let that be especially remembered—but steam-driven, a thousand *dog*-power if you please, for we must not even mention horses, or we shall drop back into the old Scylla and Charybdis of 'traction' and of 'rolling,' two ideas to be eschewed like poison.

Let us suppose the picture of this formidable looking cylinder of claws to be sufficiently described, for the moment—reminding one at a distant view, of a half-breed between a hay-tedding machine and

a CROSSKILL's clod-crusher—but unlike them, fundamentally distinct from any and every instrument that was ever seen afield, as doing its work not by traction, not by its rolling weight, but DRIVEN by its axis, as the steam-paddle, the circular saw, the driving-wheel of the locomotive, are driven, supported by its own apparatus, and abrading the soil with its armed teeth, first cutting its own trench, burying itself to the required depth, and then commencing its onward task, *tearing down the bank* (so to speak) on the advancing side, canting back the abraded soil, earth's *sawdust*, "comminuted, aërated, *inverted*" into the trench it leaves behind.

And here we would stop for the present to take breath, and let our readers do the same, before proceeding to a future chapter. If we have failed in making our picture clear, or intelligible, it is yet not that about which we feel so much solicitous, as to "draw aside the curtain." The idea of ploughing and digging stands like a thick blind before the whole philosophy of the subject, and screens the inventive mechanician from the simple application of his mind to the *quod est faciendum*. His faculties are clogged, stupified, held in check by the pestering contemplation of *processes* that enter not necessarily into the problem to be solved, nor need appear in its solution. They are unessential to the matter. They became so *the very instant the steam-engine was discovered;* a power, and the only one we possess that can be carried to the field, and *put into* an agricultural machine—like the main-spring into a watch—to give it independent intrinsic action *within itself*, owing nothing to, but separate entirely from, the traction and progression of the implement along the field. Hitherto there is not even the attempt so to apply it; it has never had a chance. Every field-implement we have, works *by* traction—like the *pedometer* that ticks because the wearer marches; but with steam for our mainspring we can make the '*watch* tick in the fob of the dead soldier'! When we understand that, when we have in idea and in fact detached the *work* of *cultivation* from the mere progression of the implement, made them perfectly separate and independent, so that if you ceased to proceed, your "coffee-mill" would still be *at work*, and only wanting fresh coffee to grind, then, and only then, shall we have laid hold of the end of the clue that leads to cultivation by steam; for then, and only then, shall we have begun to appreciate the real and unique value of the new agent we possess. To attempt to gear its noble faculty to the dragging of ploughs or the redoubled solecism of *rolling spades*, implies an utter oversight of the very elements of the enquiry, arising from a blindness of the essential characteristics of the new power we possess, the *specific* advantage that it offers, and the exactions that it makes,—exactions founded in the deepest axioms of physical truth, inherent in the recondite laws that pervade Matter and Motion, and regulate their harmonious development under the inventive energy of our race. *C. W. H.*

## REPORT ON THE AGRICULTURAL SECTION OF THE GREAT EXHIBITION.

No. VII.—The next part of our Report refers to "Division D. BARN MACHINERY."

THRESHING MACHINES cannot receive from us any weight of commendation equal to that contained in the tabular statement of results of their trials at the Royal Agricultural Society's meetings; and therefore, without attempting any description, we will just state a few of the comparative merits of some, as brought out by the tests applied at the Exeter meeting last year.

| Names of Makers. | Nominal Horse-power. | Speed of Horse in Miles per Hour. | Revolutions of Horse-wheel per Minute. | Revolutions of Drum per Minute. | Horse-power required to drive the Machines empty. | Time of Threshing 100 Sheaves of Wheat. | Horse-power required to Work the Machine. | Horse-power that would be required to Thresh 100 Sheaves in one Minute. | 20 supposed to represent perfect Work. Clean Threshed. | State of Straw. | Broken Corn. | Total Numerical Estimate of Excellence of Work. |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | m. s. | | | | | | |

As it is desirable to perform work cheaply as well as perfectly, the eighth column here given is quite as important as the last; and by comparing the two, the farmer wanting to purchase a machine may discover which of the principal makers can furnish him with one that will thresh in the best manner for the least expense. There are various advantages, however, possessed by a good portable threshing machine, which are open to every one's observation—such as lightness combined with strength, convenience for taking up and setting down, &c. And in these particulars, we believe, there is little that is new, the separate carriages for horse and barn work, or arrangements for packing both on one pair of wheels, are well known. It is certain, though, that the general workmanship of the different machines is much improved within the last year or two. Straw-shakers seem now to be thought an indispensable adjunct of the barn works; and in some cases a screen or riddle has been attached, in order to facilitate the after operation of roughing. The favourite form of shaker is that composed of parallel bars, the alternate ones rising and falling with a circular motion; but the bars are of different shapes and fitted with various kinds of screens and teeth. Garrett's Patent Portable Threshing-machine has a registered straw-shaker, and also a patent riddle and winnower. It is adapted for threshing all descriptions of grain in large quantities, and may be worked by steam, water, or horse power. A screen attached to it riddles away all loose ears, short straws, &c., and leaves the corn ready for the dressing-machine. When driven by a small steam-engine, the cost of the whole operation is supposed not to exceed from 6*d.* to 9*d.* per quarter.

Crosskill's Threshing-machine, with four horses, has threshed from 40 to 45 quarters of Wheat per day, and 50 to 60 quarters of Oats per day. The shaker will thoroughly shake the corn from the threshed straw, and rapidly convey the straw 10 feet clear away from the machine, thus saving much corn and the labour of two men and a boy. W. Hensman and Son, of Castle Works, Woburn, Bedfordshire, obtained the first prize at Exeter, for their Threshing-machine. The drum being on a new and superior principle, the draught is lessened while the work is better done, as appears from the table already given. It will thresh clean all descriptions of corn and seeds; and by its being fed lengthways, instead of ears foremost, as in other machines, it will deliver the straw as straight and unbroken as when in the sheaf. Barley may be threshed by it in a superior manner for malting, a brighter and better sample and more free from awns being produced, than when threshed with the flail, and without the nib of the seed being in the least injured. Hensman's Patent Vandyke Hand-threshing-machine, is a valuable invention. The outer edges of the beaters on the threshing cylinder are of a vandyke or tooth shape, revolving through similar notches in the concave; they perfectly penetrate the straw and strip it of its contents. The average capability of the machine for three men, is to thresh seven or eight quarters of Barley, Wheat, Oats, or other grain per day, without injuring either corn or straw more than in flail threshing; and it will head and draw Clover seed upon an average six bushels per day.

Hornsby's patent united threshing, shaking, and riddling machines will thresh all sorts of grain, and combine upon one frame (moveable from place to place upon four wheels, on which they stand when at work), a double crank straw shaker with a patent reciprocating trough underneath, which delivers all that drops through the shaker to a riddle placed on the end of the trough, where all the corn, chaff, short straws, &c., are separated.

Barrett, Exall, and Andrews' patent hand-threshing machines have the advantage of being entirely of iron, and yet very easily shifted from place to place. This firm have a remarkably ingenious contrivance for adjusting the concave to the drum; and their patent safety horse-works appear to supply all that is needed of compactness without a counterbalancing amount of extra friction. The two-horse power machine threshes from 10 to 14 quarters of Wheat, or from 12 to 15 quarters of Barley in a day. The horse works are fixed upon a wood frame on low iron wheels; and the levers, which act as shafts, have a strip of iron running along their top side, so that the barn-works on little wheels are very easily run up and down upon them as on a tram rail.

Most of the straw shakers, from their tearing action, and from the number of long spaces between the bars or rails, make a great deal of pulse; and Hornsby has adapted his reciprocating trough on purpose to catch and riddle this pulse out of the corn. But Tuxford and Sons, of Boston, have attempted to obviate this defect altogether Their patent perforated table shaker-off, is clothed with a continuous web of wire, so that only a very small portion of straw is passed through with the grain. It is also furnished, when required, with a finer web of wire, by which the pulse is separated from the grain, and delivered into a separate partition.

We noticed what we supposed to be a straw-shaker, patented by Robinson, of Halsham, in Holderness, Yorkshire. It consists of nine plates like windmill shades, revolving in one direction by means of small wheels at both ends. It does not seem calculated the prevent the defect we have mentioned above.

W. Carpenter, of Banbury, exhibits an anti-attrition threshing machine, in which he has boldly applied friction-wheels to the drum bearing. The axle rests upon a wheel about one foot in diameter, and has two smaller ones above it. If these wheels will keep the drum axle exactly true in every direction, they will undoubtedly lessen the draught very materially.

M'Cartney and Drummond, of Cumnock, Scotland, exhibit a fixture threshing apparatus, for horse power. It is in cast-iron framing; has a circular straw shaker, and elevators to conduct the corn up to the winnowing fans and riddles situated high up above the drum. Fixed machines, though on a different principle to this, are coming into use in our better farmed counties; but steam power is preferred before that of horses. From the increasing number of portable steam-engines, we should say that we are much more likely to see the corn in every stackyard threshed out by these travelling machines, than by mechanism permanently erected in the buildings.

The best WINNOWING or CORN DRESSING MACHINE in the Exhibition is most probably that invented by Hornsby and Son—seeing that it obtained the Royal Agricultural Society's first prize in 1850, in 1849, in 1848, and a prize also in 1846; and this after trial in competition with all the best machines. At Exeter, the closest competitors were Hensman and Hornsby; but as the former had borrowed the best parts of his machine from the latter, the judges awarded the prize as we have stated. The advantage of Hornsby's over others is, its being fitted with a spike roller working through a grating, so arranged as to form a hopper: it it is capable of separating the corn from the chaff in a rough pulsy state, as it comes from the threshing machine, without having been previously riddled; and is easily adjusted to suit corn either in rough chaff or any other state. It is also fitted with a double shaking screen at bottom, which more effectually cleans the corn from all kinds of small seeds than a fixed one. For the second time over, the strap which turns the spike feeding roller is taken off; and a board being placed in front of the grating, makes it an excellent machine for finishing the corn for market. Superior as its action may be for rough corn, it is of still greater value for finishing—the judges at Norwich describing it as "dividing the refuse in a masterly manner." The dressing machines of Cooch, Holmes, Wedlake, &c., and all the better makers, are also to be viewed on their respective stands in this class. We noticed one by W. Nicholson, of Newark, having a simple contrivance for regulating the power of the blast. The back of the fan case is eccentric, and has a shutter or valve which is opened inwards or shut to throw the double blast off or on. A "potterer" and the screen and riddles are all vibrated from one crank.

Another machine, shown by W. Halston, of Marno, Renfrewshire, is of peculiar construction; and evidently intended for cleaning the grain of hariff while winnowing it. There is an endless cloth in the place usually occupied by the screen; and this delivers the corn on to a shaking screen near the ground. The hopper consists of a flat dish or receiver on the top of the machine, resting on friction rollers, and by a quickly sliding motion jerking the corn into the machine. W. Grounsell, of Louth, Lincolnshire, exhibits a "registered corn-dressing machine," which seems capable of cleaning grain and seeds by means of sloping and shaking riddles, without the aid of wind. *I. A. C.*

## IRELAND.

PERHAPS there is not a more questionable subject than the existing state of Ireland. By those who benevolently and rather sanguinely look for her prosperity, every favourable symptom is seized on with avidity, and lower poor-rates and diminished recipients of poor relief are regarded as conclusive proofs of coming prosperity. By those who, in governing the country, would gladly get rid of the Irish difficulty, the shaded side of the picture is disregarded, and they fondly direct attention to the prominent points on which the sunlight gleams. But to those who will more intimately inquire into the various workings of our social state, and do not allow their sight to be dazzled by a surface glare, nor their opinions to be led by their wishes, *la couleur de rose* is not quite so apparent. It is not quite evident to them that our transition state has yet assumed a favourable phasis.

That some beneficial springs of action are in motion there can be no doubt, the inevitable consequences of the ever-changing modes in man's existence. Stimulated by the recent impulse given in Ireland by the deplorable sufferings in the years of famine, and by the painful consequences of them, an acceleration of these social movements has probably obtained, and we have, perhaps, somewhat sooner than we otherwise should, in the necessity of securing our daily bread by our daily labour, become, in all ranks of society, from the highest to the lowest, more provident, more given to habits of industry. We are no longer a reckless people, regardless of the morrow. We are yet, however, without those surest signs of advancing prosperity, an increased employment of the people.

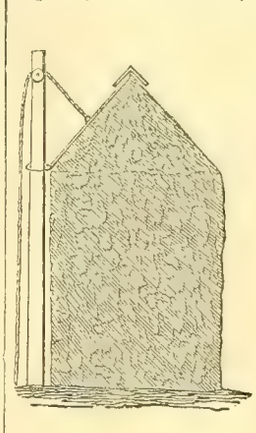
A decrease in poor-rates and of the numbers receiving relief, which has been confidently put forth as a proof that we have turned the corner and are now on the open road of prosperity, ought not, I think, to receive that implicit trust which is demanded for it; for we are to recollect that many other causes are at work, other than an improvement in our social condition, which are sufficient to cause this decrease: among which I will name a population daily decreasing, and the great distaste to poor-house restraint and poor-house treatment which covers our roads with beggars. An increased demand for land is perhaps rather to be attributed to a subsidence of the panic than to any improvement in the pecuniary condition of the tenantry. The new tenant appears as deficient of capital and to be as struggling a man as the old one; he follows no other system of tillage; his only effort is still to take from the land all he can, and to give it as little as possible. He has been drained by the cupidity of his landlord of what little money he had, as an admission fee, and will hold on as long as his landlord will feel himself compelled to allow

arrears to accumulate, and then, with the proceeds of a runaway crop, will run away to the land of *freedom*.

To enable us to form a just estimate of our actual condition, whether progressing to improvement, or yet but living from hand to mouth, it may be requisite to look back to our state previous to the Potato loss, with a view to ascertain in what condition it has left us—indeed, to see whether it has left us a leg to advance with.

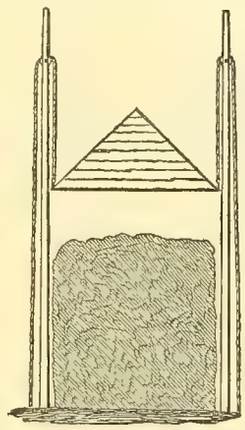
The Irish farmer of every grade, at least in the centre, the south, and the west of Ireland, has ever been very deficient in capital; and I believe in this category I must include far more than half of the north and east. Indeed, for high farming, except in very few instances, it does not exist anywhere. Even the little capital he has he grudges to expend on labour. So far, indeed, does this feeling go, that he rarely talks of expending money in labour, but of losing it. A distant return from outlay is not thought of; in truth, it rarely can be waited for. The buildings he requires on his farm he has been habituated to erect; he will therefore build; but draining and subsoiling are novelties; and if his landlord will not do these things, however the land may require them to be done, they must remain undone; he cannot do them; and if he could, he would not be so very a simpleton,—such an "Omadhaun"—as to lay out his money on another man's ground, although he and his children have every prospect of remaining tenants on it as long as they pay the rent, and perhaps for two or three years afterwards. The land was therefore never any more than the farmer's pocket, in a state of repletion, and when the Potato loss occurred, both were found unequal to the struggle that ensued.

From this general want of capital, the farmer was compelled to deal on credit for everything, even his stock and seed, &c., were rarely bought by ready money; for the labour of his farm, including blacksmiths' and carpenters' work, he always, with few exceptions, depended on credit; and this he was enabled to obtain, by these persons being capitalists, to at least the amount of their year's provisions. The system netly was this: "My labourers, my smith, and my carpenter, upon a pretty just calculation of what their several earnings would amount to in the year, rented from me such a quantity of land to grow Potatoes on, as at the end of the year would mutually discharge us." If the land was manured, or otherwise in a state to yield a crop of Potatoes, the rent was from 3*l.* to 5*l.* an acre. Where manure was of small value, as in localites in which bog was convenient, or where the manure was rather a stimulant than a food to the land, as sea-weed, or in the burning the surface, the operations of paring and burning being performed by the temporary tenant at a rent of from 25*s.* to 50*s.* To the labourer constantly employed, I perhaps let a cabin and patch of ground for a Cabbage garden at 30*s.* a year; the summer grazing of a sort of a cow, if he happened to have the good luck to have one, at two guineas, and hay for wintering her at 30*s.* a ton. In some cases the labourer would have a couple of ewes, whose milk he shared with their lambs, and for which the summer grazing was a guinea; or he rented from me, during pleasure, an acre and a half of land, which he cropped one-half in Potatoes and the other half in grain; but in whatever way it was managed, I got his labour without possibly giving him more than 10*s.* in hard cash during the 12 months. This was the general rule in Ireland.



The loss of the Potato, on which esculent this whole system rested, brought a change which no one was prepared to meet, and which there was not energy or wisdom in the Government to smooth down. At once, with one fell swoop, the whole capital of the country, on which alone hung our labour, and which enabled us to expect some 13,000,000*l.* of produce, was swept away. It virtually left us nothing but the land, and deprived us altogether of the means of using it. As yet, no change from this state, in which this loss has thrown us, has taken place; nor without some extraordinary provision of the Government, attended perhaps with some extension of grain culture, in the way I have suggested, or the recovery of the Potato, can any arrive. We are still without capital, as we were in 1846, and so we must remain. We have no means wherewith to pay labour; our land is therefore laboured at the smallest expense of tillage, and Oat crop after Oat crop is dragged from it as long as it will give it, with only a spring ploughing, perhaps with asses, 3 or 4 inches deep; the only labourers employed being the occupier and his family, frequently young children, in an occupation of 30 or 40 acres.

There is, however, I doubt not, much less of physical suffering, both as respects numbers and intensity; the broken-down are in the grave, in the poor-house, or in America, or in somewhat more comfort from the assistance they derive from relatives or friends who have emigrated, and who, when they can remit, rarely neglect their friends at home. The first intent of the emigrant is to defray the cost of emigration of some one from the mother country; when his means do not reach to this, to send them small sums for their support at home.



These small sums, in the aggregate, come to a very considerable amount, for it is wonderful how much they send over; yet they tend not to enrich the country; they return with very serious additions to America for Maize, which has become the common food of the poorer classes. The recovery of the Potato will keep this money at home, and the hope of the people, which rests solely on its recovery, is well founded; it will gradually lead to the re-establishing that order of things which existed previous to the disease in it, and we can expect no greater good. We have been taught the value of this deservedly favourite bread-fruit of the Irish, and the folly of expecting to derive any benefit in the deprivation of it. *J. M. Goodiff, Granard, June 3.*

## Home Correspondence.

*Thatch v. Permanent Shelter.*—The letter of "C. L." has induced me to send you a rude drawing (No 1) of a permanent covering to a Wheat stack I saw in the neighbourhood of Southampton; it consists of a light hiped framing of wood, and a covering of canvass made to fit it. A pole was placed in the ground at each corner, provided with pulleys at the top, over which passed ropes attached to each corner of the frame, and by this means the covering was raised or lowered as required, either at harvest, or when housing the Wheat.

No. 2.

No. 1.

The canvass was painted occasionally, and when my informant told me that it had been in use 14 years. I am unable to state now what it cost; but if it has been in use so long, I think there can be little doubt but that it is cheaper than thatch, to say nothing of its superior advantages in other respects. Such coverings would have been no small boon in the harvest of 1848; and I see no reason why the same covering may not be applied to oblong, as well as square or round stacks, only the covering should be in two parts, and if the rick be long, a pole in the middle will be necessary, and rings that would slide easily on the cross poles should be fixed to the bottom of the framing, by means of a piece of stout hoop-iron bent through the rings, and screwed to the frame-work; this would form a joint that would admit each half of the covering being drawn up close to the poles, whilst the roof of the stack is being made, and when finished to be lowered until the parts meet. A ridge cover might be made by nailing two wide boards together, which would make all safe, but I have sent a rough sketch (No. 2) of what I mean, and if you think this will assist in promoting the discussion desired by "C. L.," perhaps you will give this a place in the *Gazette*. *E. Curtis, Kempshott, Hants.*

*Turnip Cutters.*—As I observe you are pointing out the characteristics of the different agricultural implements in the Exhibition, I beg leave to add to the description of my new patent Turnip cutter, recently sent to you, that it still maintains the distinguishing features of Gardner's patent—the crank step by step knife—which is the only one that has hitherto successfully withstood the test of hard-frozen Swedes. *B. Samuelson.*

*Agricultural Improvement.*—As this ought to be the great lever for lifting the incubus that depresses agriculture, I may perhaps be permitted to make a few remarks on the subject. Though I may not be able to do more, in the way of new discoveries, than merely to throw out hints for others to improve upon, yet, if they should tend to the consideration of the subject by landlords, stewards, tenants, gardeners, mechanics, chemists, geologists, botanists, and others, who may be able to throw light upon it, the effort will not be useless. Although very great improvement has been recently made, there is still a wide field open for further investigation. A few minerals have been discovered, and some precious metals have been extracted; but the mine has not been profitably worked, not because of its poverty, for it is undoubtedly rich, but because the proper means of penetrating to a far greater depth have not yet been hit upon. Recent advances prove that the deeper we penetrate, the richer the store is found. Poets and fabulists, may, in some cases, be considered as prophets. Thus when the old farmer in the fable told his sons to dig deep for the hidden treasure, he seemed prophetically to tell us of the food of plants which has been, and may probably be much more largely discovered in the subsoil. So, when the poet sang about every rood of land maintaining its man, he intimated the amazing power of production which the soil possesses—a power, the extent of which has not, even to this day, been discovered. "Stop!" says an old brother farmer, "You are going too fast; I have tried high cultivation and I have found that my land could not be forced beyond a certain production." As another old farmer, who has tried it, I grant you are right, according to the present practices of high cultivators, at least with respect to corn crops. But we know not what future discoveries may do. Can nothing be done to prevent corn from being laid? May not the straw be strengthened, and the root-hold be increased? Both chemical and local means may be employed for this purpose. Let us take a hint from animals. We endeavour to feed and train them according to their destination. We do not stint the young animal of bone-producing food, or the growth of our young stock, by pinching them up, as a Chinaman does his feet, lest they should grow as large as they were designed to be; neither should we pinch our vegetables of the room they require, sideways and downwards—upwards we cannot—to bring them to the full perfection which they are capable of attaining. They would probably pay for much more liberty both sideways and downwards, particularly downwards, than even the best farmers have allowed them. The number of Turnip, Bean, Wheat, or other plants, that ought to grow on a given surface must vary to some extent, according to the nature of the land and climate; but numerous and repeated experiments are required on this subject. If agricultural societies would expend less money in premiums for live stock, and more in experimental and practical cultivation, they would become more useful than they now are. With respect to thin sowing, I would observe that the trial has been unfairly made, from the subsoil not having been sufficiently cultivated, and the plants being crowded, instead of being placed singly in rows, though those rows may have had wide intervals between them. More attention ought to be paid to the cultivation both of the alleys and the subsoil, so as to tempt the delicate fibres to seek far and wide for the deeply hidden treasure. Without strict attention to these matters, the excellent system so long since successfully adopted by Tull is not fairly tested. Thus many good practices are condemned, because they are not fully and fairly carried out. Labour is the source of wealth, and by labour alone the soil may be enriched; labour is, in some measure, a substitute for manure. What is the Turnip crop when the hoeing is neglected? Even if the land be well manured it is a miserable affair. But to hint at something new; for we must try to discover new improvements, as well as to practise recent and older established ones more fully. I would ask, how can steam-heated air or vapour be generated or infused in the soil? And can we not make it the storehouse for all those precious gaseous and aqueous virtues which escape from our farm-yards and manure heaps? How wastefully are the atmosphere and the water-course polluted with those essences so essential to the fertility of the soil. I would also ask our scientific men to consider how we can convert an enemy—superfluous or stagnant water—into a friend, after filtering it through the earth? Can we not bring it back as a useful servant? Can we not convert it into a profitable kind of liquid manure? Treasures untold may be extracted from the elements, and we want information on the means of applying them to the service of agriculture, as science has arrested them, and applied even the terrific lightning to the service of the world, and as the miller long since employed the wind and the water as his servants. When we think of the wonderful improvements effected elsewhere, we must be convinced that very much still remains to be done for agriculture, and we must endeavour to make the discoveries. Chemical combination is a very important subject for investigation. How greatly has the practical farmer suffered by his ignorance of it! How sadly has good manure been wasted by suffering quicklime to come in contact with it! And how have vegetable soil and quicklime been wasted by being mixed together in compost; whereas if lime and salt had been judiciously mixed, a far better dressing would have been obtained at less cost; and the vegetable soil might have been advantageously mixed with liquid manure, or with farm-yard manure, and covered over it. But I must conclude by saying that our general practice is by no means up to the example exhibited by a few first-rate cultivators, and even their cultivation is capable of being carried to still greater perfection. Therefore let us not sit down in despair, but go forward. *O. F.*

*The removal of Smithfield, and the want of two Markets, north and south of the Thames, in its place.*—Now that the market at Smithfield is decided to be done away, permit me to call attention to the occasion there is for two markets, and the inconvenience to the farmers, butchers, and landowners, if the present intention be carried out of having only one market on the north side of London in its place. I would direct attention to the extra loss to the graziers of the districts south of the Thames in having to drive their stock so much further through London and back, to those butchers, who, living south, must be buyers at the northern market. The loss of weight, from the driving of cattle, is very considerable, even with the best care; but who can say to what this amounts, when animals, after long confinement in stalls or yards, and loaded with fat, have been urged beyond their strength through the bustle of London. It has often been a subject of reflection to me, both as to what is the amount of the loss, and who is the loser? and I am satisfied that the difference between the weight of the animal when he quits the farmer and when he falls at the London butcher's, is never less than 3 per cent., and much oftener 6 per cent.; and that this loss falls entirely on the feeder, for the butcher, in buying, ever judges the animal by his experience of the weight he realizes in his slaughter-house; and in this way the feeders of stock sent to Smithfield lose 3 to 6 per cent. on the ten millions per annum of stock sold there, without benefiting anyone a farthing. Now, in considering the subject of cattle markets for London, two points are most important. The first is the economy of those who supply the market; and, secondly, the public convenience. It is easy to show that all this can only be attended to by giving two markets, one north and

another south of the river. Surely it must be evident to everyone considering the question, that the removal of Smithfield from a centre to an outside will not, in the least, relieve London of the present nuisance of cattle passing through; for the saving of driving from the one side will be counter-balanced by the farther distance the stock must go the other. The farmers of Kent, Surrey, and Sussex must still drive their stock through London, and the butchers south of the Thames will have to drive back again; but if the market were divided and held on alternate days most of the driving and hubbub of a single market would be done away. The butchers south would soon be taught to draw their supplies from their own market, as those north would from their side, and in this way there would be but little cattle traffic through London; and the sufferings of the animals would be lessened in proportion; and I can see no legitimate interest that would not be the better for it. I am sure the farmers and consumers would, and I should then look forward to seeing all stock coming by railways, and London relieved of its cattle droves, and farmers getting the better prices London should afford them by the higher prices the consumers pay; but which is now all lost by the way. If the South Western Railway would take this up, and appropriate some of its waste land in the York-road to the making a market and abattoir, such as the late Mr. Perkins formed at Islington, what a public advantage would it be! We should have the breeders in the west sending up their stocks, and London, with greatly reduced inconvenience to its inhabitants, would become the emporium for meat and stock to all the principal towns down the line; for all parties would soon become sensible of the saving and utility of such a market aside such a highway. *Hewitt Davis, 3, Frederick's-place, Old Jewry.*

## Societies.

### ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

PROFESSOR WAY delivered before the members, on Wednesday last, a lecture on the Agricultural Employment of Gypsum; a report of which, and the discussion which followed it, we shall give in our next publication.

HIGHLAND AND AGRICULTURAL, *April* 16. — A Monthly Meeting of the Society was held in the Museum, when Dr. ANDERSON delivered an Address on the Discussions which have taken place during the Session. Professor Low occupied the chair.—The subjects of our discussions during the past winter have been four in number.

1st. The best varieties of Wheat to sow: quantities of each, and comparative advantages of drilling, dibbling, and sowing broadcast.

2d. The substances which can be most profitably employed as an auxiliary for Turnips, for fattening cattle and sheep.

3d. The best mode of preparing and applying the different manures produced upon the farm.

4th. The most suitable proportions and quantities of Grass and Clover Seeds to sow for Hay, soiling, and pasturage; the substances most profitable for top-dressing, and the proper time for applying them.

The subject of the first discussion, that of the best varieties of Wheat to sow, is one of a purely practical character, on which I shall not venture to offer any opinion, but shall endeavour as succinctly as I can, to review the opinions of the different speakers. The subject, however, is unquestionably one of great and increasing importance to the farmers in Scotland, as it appears from Mr. Finnie's statement, that within the last 10 years the cultivation of Wheat has extended so greatly in Scotland, that the quantity of land under that crop now exceeds the quantity under Barley, while previously to that period exactly the reverse was the case. It appears that close attention must be paid to the climate and soil of each farm, and that certain Wheats are adapted to the climate of different districts. It is distinctly made out by the concurrent testimony of the speakers, that few if any of the English varieties of Wheat are adapted for cultivation in Scotland. Many have been tried, among which Taunton Dean, Tall Cluster, Kent White, Woolly-eared, Uxbridge, Talavera, and several others, but experience has almost invariably proved unfavourable, the quantity generally having proved decidedly inferior to that obtained from Scotch Wheat, sand the quality, though at first occasionally fine, appears soon to have undergone degeneration. Of the ordinary Scotch Wheats, the varieties largely cutivated do not exceed four or five, and these have attained the support of the farmers of all the principal Wheat districts of Scotland. The varieties are Fenton, Hopetoun, Hunter's, Red straw white, Spalding's Prolific, and one or two others of inferior importance. Of these, the first appears to be most generally preferred, and it possesses the important advantage of having a short, thick, and strong straw, which makes it little liable to lodge, and peculiarly adapted to high farming. The Hopetoun and Hunter's next to it, are the most approved, and until lately, Hunter's appears indeed to have been the most generally cultivated of all the Scotch varieties. As to the quantity of seed sown, considerable difference appears to exist in the different districts. In East-Lothian from 8 to 9 pecks are given up to the 20th of November, after that 10, in December 11, and in spring 12. Nearly the same proportions are recommended by Mr. Scott and Mr. Dickson, as those they have found best adapted for their purposes; but Mr. Finnie employs from 12 to 16 pecks, and in Stirlingshire from 8 to 15 appear to be used, and after green crop 2 or 3 pecks more. In one point all the speakers agree, and it is the necessity for increasing the quantity of seed as the season advances, a practice which appears to me to be intelligible on physiological grounds. The probability is, that all the grains of Wheat are not equally readily germinated, some requiring a longer time to commence their growth, and when they are later sown less time is allowed them for this purpose, and a larger number never come to maturity, and to provide for this a larger quantity of the grain must be sown. The same explanation will serve as the reason why some of our speakers employ habitually a larger quantity of seed than others. Mr. Finnie, for instance, employs a much larger quantity; now his farm is a high lying and exposed one, and on it the germination of the Wheat is more likely to be slow and imperfect than on those farms which have a superior climate. Should this explanation be correct, it may serve to indicate to those cultivating in high and backward districts the necessity of giving a liberal supply of seed. And it may also explain the different experience of Scotch and English farmers on the subject of thin sowing, a practice which has been tolerably successful in England, but in Scotland has invariably been attended with disappointment. The superior climate of the Wheat districts of England enables nearly all the grains to germinate, while here, unless in favourable seasons, this cannot be expected. On the subject of the different methods of sowing, the experience of the speakers appears to vary more than on any other point, and on one method, that of dibbling, we have very little information. The only experiments referred to being those of Mr. Hay, of Whiterigg, who found that a larger produce of Wheat was obtained from dibbling than from that sown broadcast; but that the quality was decidedly inferior, the former containing a larger proportion of light grain, and the good weighing only 59 lbs., while the broadcast weighed 62 lbs. Opinions seem to be pretty equally divided between broadcast and drilling, and Mr. Paterson and Mr. Hope state that no difference is to be observed between these two methods of sowing. That this should be the case in some instances I can easily imagine, but I should for my own part, and on theoretical grounds, be inclined to go in favour of drilling. My reason for it is the facility which it affords for employing the hoe, a practice which I think is consistent with theory, and which I believe has been found advantageous on most farms. As far as the *mere sowing* goes, however, I cannot see what advantages the one can possess over the other. Provided the grain be pretty equally distributed and properly covered, I should imagine it immaterial whether it be arranged in straight lines or dotted over the land. It is the facility of cleaning the land which gives drilling its superiority. Mr. Hope has touched in his observations on the prevalent idea that Wheat is a more exhausting crop than any of the other cereals, as Oats for instance, and has expressed the opinion, in which I agree with him, that this can scarcely be considered to be correct. Weight for weight—no doubt Wheat is so; but in order to arrive at a fair result we must not compare equal weight, but determine the total amount of valuable matters removed by a crop of each, and we shall then find that an Oat crop ought to be decidedly more exhausting than Wheat, as it removes from an acre a much larger quantity of those substances than the latter. The grain of Wheat and Oats contain very nearly the same per centage of nitrogen, but the amount of mineral matters is twice as great in the latter as in the former, and if we further take into account that a Wheat crop may be from 4 to 5 quarters, and an Oat crop from 8 to 10 quarters, it seems tolerably clear that the exhausting effect of the latter must be decidedly greater than that of the former. I confess, however, that I do not think we ought to discuss too minutely the comparative exhausting effects of different crops, a question which really appears to me a less important consideration at the present time than it was in a less advanced state of the science and practice of agriculture. It was of paramount importance, under the old system of agriculture, when we trusted much more to the unassisted efforts of Nature than it would be considered either prudent or profitable to do at the present day. The system of high farming now prevalent, however, is characterised by the continual addition to the land of a much larger quantity of those matters than the crops remove from it, so that when that system is fully and effectually carried out, no deterioration, but rather an improvement of the land takes place. The second discussion on the substances which can be most profitably employed, as auxiliary to Turnips in the fattening of cattle and sheep, presents another of these subjects, which the progress of agriculture has raised to a high degree of prominence and importance. Mr. Brodie, of Abbey Mains, who opened the discussion, has illustrated this by a number of very interesting details. He informs us that some farmers employ extra keep for their stock, to the extent of 1*l.* per acre, over the whole of their holdings, and that taking the country at large, many millions sterling are annuallly expended on the purchase of such food. Considering the magnitude of these sums, one would be inclined to anticipate that every farmer would have endeavoured, by careful experiment, to determine the plan of feeding best adapted to his farm. Mr. Brodie, however, is inclined to think that this is not generally the case, and that notwithstanding the extent to which the use of the extra food has reached, many farmers have adopted their special systems, without that amount of careful experiment, and minute registration of expenses, which are required for a full estimate of the advantages and profits of their practice. I can easily understand, that there are many instances in which special circumstances may have induced a person to adopt a particular practice, and carry it on for a long period with average success, without a sufficiently complete comparison with other systems to enable him to determine whether it is really the most profitable that can be employed. The employment of other substances along with Turnip is a practice in all respects consistent with our knowledge of the physiology of digestion. In order that that process may proceed in the most perfect manner, it is necessary that there shall be a certain quantity of food for the purpose of sustaining the health of an animal, but the object of the feeder is to cause his cattle to consume a larger quantity than this, so as to produce what may be called an unnatural accumulation of flesh and fat. But the increased amount which can be consumed is limited in the case of the Turnip, by its excessive bulk, which overloads the stomach and prevents the process of digestion going on with that regularity and completeness which is required. In order that digestion may be complete, every part of the food must, by what are called peristaltic motions, be brought in contact with the absorbing surface of the intestines; but when the quantity of food is excessive this takes place imperfectly, and the intestines are distended in such a way as to retard the process of absorption. The feeder must therefore endeavour to supply a large quantity of nutriment in a smaller bulk, and for that purpose he is compelled to select some auxiliary to his Turnips, by which he gains not merely in the improvement of his stock, but also in the production of a larger quantity of valuable manure. In the selection of the particular auxiliary to be employed, then, the farmer must look for that which contains the largest amount of nutritious matters at the smallest price, and in doing this, we require to consider two points; firstly, the chemical composition of the substances by which we determine the amount of nutritious matters contained in them, and secondly, the proportion of these matters which may become available to the nutrition of the animal. The first of these is a matter on which, by extended chemical analysis, much light may be thrown, but the latter is a question for experiment on cattle themselves. It is not a chemical, but a physiological question, and its importance will be understood, when we bear in mind that even where digestion is complete, a certain proportion of the valuable matters always escapes assimilation, and that the proportion which does so may vary in different species of domestic animals, and even in the same animal at different periods of its life. To take an illustration of this point, suppose we supply a lot of sheep and a lot of cattle with the same quantities of food, it by no means follows that the increase in weight of the two shall be equally great; in other words, the same quantity of food supplied in the two cases does not produce the same amount of fat and flesh; yet, in both cases, the amount of nutritious matters is the same, and the cause of the difference is in the physiological peculiarities of the different species of animals. Now, chemistry can supply the requisite information as to the amount of nutriment which any food contains, but experiment on animals must determine how far that food is capable of increasing the weight of the animal. The investigations of different chemists have thrown much light on the nutritious value of different foods, and at the discussion I referred to experiments on progress in my laboratory, the object of which was, to form a complete and extended table of the nutritive value of all our most important cattle foods. In these experiments the proportions of nitrogen and soil, which are infinitely the most important of the nutritious elements, have been selected as the means of comparison, and I have thus formed a table, as yet however incomplete, which will enable us to estimate the comparative advantages of the foods employed. Of that table, the following gives a view of the results. It shows the number of pounds of nitrogen and oil contained in the different foods, deduced principally from analysis made in my own laboratory, partly from the results of other chemists:—

| In a ton of | No. of lbs. Nitrogen. | Oil. |
|---|---|---|
| Linseed, English | 97 | 777 |
| ,, Foreign | 76 | 715 |
| Oil-cake | 103 | 224 |
| Poppy-cake | 110 | 129 |
| Rape cake | 105 | 223 |
| Beans | 85 | 32 |
| Peas | 77 | 29 |
| Oats | 60 | — |
| Barley | 42 | — |
| Oat dust | 27 | 83 |
| Turnips | 4¼ | 7 |
| Distillery | 5½ oz. | — |

Now by comparing these results it will, I think, be sufficiently clear, that no substance is equal to oil-cake in point of nutritive value at the same money. A ton of oil-cake may be bought for 8*l.*, and for that sum there are obtained 103 lbs. of nitrogen, and 224 lbs. of oil. A ton of Turnips, on the other hand, is valued at somewhere about 8*s.*; 20 tons will, therefore, bear the same money value as 1 ton oil-cake, but they will afford in the form of nutriment only 85 lbs. of nitrogen, and 150 lbs. of oil. So, by comparing the other substances, it will be seen that Poppy and Rape cakes supply nutriment at a cheaper rate. All these are what may be called oleaginous foods, but we have also others, in which the quantity of oil is deficient, but in which we have abundance of nitrogen and of starchy and saccharine matters. Beans and Peas are the most important and valuable of them, and after them follow Oats, Barley, and the other grains. Such are the conclusions which chemistry leads us to draw; and their general correctness was fully confirmed

by the very valuable and clearly explained practices of the gentlemen who favour the Society with their opinions. Mr. Brodie gave the result of a very interesting and complete set of experiments on four lots of cattle. The first fed with Turnips alone; the second with Turnips and oil-cake; the third with Turnips and ground corn; and the fourth with distillery grains and Bean-meal. The cattle were kept from October to June, and at the end of that time, the first lot weighed 536 stone, and had cost 108*l.* 9*s.*; the second lot weighed 552 stone, and cost 103*l.* 16*s.*; the third lot weighed 517 stone, and cost 113*l.* 8*s.*; and the fourth weighed 545 stone, and cost feeding 118*l.* 3*s.* Here we have the most conclusive evidence of the superiority of oil-cake; and, be it observed, the cattle fed with it weigh 16 stones more than those fed with Turnips, also while the cost of feeding has been nearly 5*l.* less. Where corn has been used the difference is still more conspicuous, the weight being 35 stones less than the second lot, while the cost of keep is nearly 10*l.* more. These results are also fully borne out by the practice of Mr. Kennedy, of Myremill, and the other speakers at the meeting, all of whom have found the great advantage of giving other foods, and especially oil-cake, as auxiliaries to Turnips; and we can understand at once the results of their practice, when we inquire, not into the gross weight of the food they give but the amount of nutritive matter it contains. Thus, for instance, Mr. Kennedy considers that the best practice is to allow 60 or 70 lbs. of Turnips; and, in addition to that 2 lbs. oil-cake boiled into mucilage and poured over 2 lbs. Bean-meal, 2 lbs. bruised Oats to 12 lbs. hay, and a stone of chaff. Now, these substances contain in all about ¾ lb. of nitrogen, which is equal to the quantity of that element contained in above 3 cwt. of Turnips. Suppose, however, that the animals were fed on Turnips alone, 2 cwt. would be about the extent of what they would consume, or they would be able to obtain little more than half the nutriment which they get from the food supplied by Mr. Kennedy's plan of feeding. Mr. Russell and Mr. Wilson have added their valuable experience to that of the other speakers in support of the example of supplying food in much the same manner as is done by Mr. Kennedy, and in every case we observe that there is given a quantity containing much more nutritive matter than is contained in the quantity of Turnips which they replace. Now this directs our attention to the question to which I have already alluded, of the availability, if I may so express it, of the nutritive matters in these different foods. It needs scarcely be observed that where, as in Mr. Kennedy's case, the supply of nutritive matter is so greatly above what can be consumed in Turnips, the weight of cattle is *proportionally* increased. The cattle become fatter, but not to the extent which might be expected, from the large supply of food, because the nutritive matters are not so readily assimilated in the forms in which they exist in oil-cake, and other similar substances, as in Turnips. It is especially for the determination of this point that I think careful, minute, and oft-repeated experiments on feeding of stock with food of known composition and quantities, are requisite. Such experiments, however, would require a far more minute and constant attention than it is possible for a farmer occupied with his other avocations to give them, and in fact are the sort which would require the exertions of a Society supplied with liberal funds. I am free to admit that with the present feeling of the agricultural public, their performance on anything like an extended scale is at the present moment almost impossible, but I feel equally certain that the time will come when it will be absolutely necessary that such experiments shall be made. In the meantime I do not see that we have any reason to complain of the advances hitherto made. The statements of the speakers show how greatly the practice of feeding has extended and the attention which has been bestowed upon it, and as time goes on we may feel sure that the principles of successful practice will become more and more understood, but could a systematic series of experiments be instituted under the supervision of some of our great agricultural societies I am convinced that most important results would be derived from them. The third discussion on the best methods of preparing and applying the different manures, brought out a large amount of precise and valuable information, and may be looked upon as a very valuable illustration of the care and attention now devoted by our best farmers to such matters. Mr. Finnie, who opened the discussion, entered at great length into the best arrangement of a farm-yard, the manure heap, and liquid manure tank, best adapted for the collection and preservation of the shed and liquid manures. His principles, without entering into details, may be described as endeavouring as far as possible to collect the liquid separate from the solid excreta. The latter he would interstratify with peat, where it can be had, or failing that, with soil or clay. Over the heap he ladles the liquid manure, so as to allow as much as possible to be absorbed, and collects in the liquid manure tank only that which cannot be obtained. Mr. Finnie, with full knowledge of the beneficial results obtained from the application of liquid manure, is of the opinion, in which I fully agreed with him at the meeting, that it will, generally speaking, be much more economical to apply manure in the solid than in the liquid state. When liquid manure can be obtained in any quantity, and applied exactly as it is required, no method, perhaps, produces more striking results. Its invigorating effects are immediately seen, and by them we are apt to be led to form an estimate of liquid manure higher, perhaps, than that which it actually deserves, and even conceive it to be superior to, and likely to form a substitute for, the solid farm-yard manure. I do not, however, think that it is consistent with what we know of its chemical composition, which should incline us to class it rather as an auxiliary, such as guano, sulphate of ammonia, and the like. Viewed in this way, its importance cannot be over-estimated, but I confess I consider it doubtful whether its advantages are likely to be felt, excepting upon what may be called altogether exceptional farms, when the quantity is so great that it becomes desirable to erect machinery for its economic distribution. That such cases exist, the experience of several distinguished farmers seems unequivocally to show, but nothing would be more rash than to attempt the extension of their systems to the general husbandry of the country. In fact, we must have solid as well as liquid manure, and for the very important reason that the latter is deficient in phosphates, which are among the most important and needful elements of our cereal crops; and wherever the quantity of liquid manure does not exceed that produced on ordinary farms, I agree with Mr. Finnie in thinking that the best and most economical plan is to convert it by means of absorbents into a solid form, rather than to attempt the application of it partly in that, and partly in the liquid form. On the subject of these absorbents, we have heard much lately, and peat charcoal and other substances have been recommended for the purpose, especially of retaining the ammonia. Some experiments and analyses made in the Laboratory of the Society on this subject will be found in the last Number of the Transactions, which show that in this respect peat itself greatly surpasses charcoal or any other substance. In these experiments, it was found that solution of ammonia was absorbed in the most effectual manner by dried peat, and that even when the saturated peat was exposed to the air until it became dry, it retained a very large quantity of ammonia. It was, however, always observed that a larger quantity of ammonia was absorbed by the peat than was retained by it after it was allowed to become dry, in some instances as much as half escaping in the latter case; and I think the fact an important one, because it indicates what practice confirms, namely the necessity of keeping the dung-heaps in a state of moderate moisture, which is the condition best adapted for preventing the escape of its ammonia. There cannot, on the other hand, be anything more important than the avoidance of too large a quantity of moisture, as nothing is more prejudicial to the manure heaps than its exposure to all the vicissitudes of our climate, at one moment saturated with rain, or more than saturated, at another dried up by the heat of the sun, in both of which cases a loss of ammonia must be occurring, with much more than the average rapidity. All the gentlemen who took part in the discussion were fully alive to this, and it afforded me much satisfaction to observe that one and all of them supported the introduction of correct manure depots, which I anticipate will be the next great improvement in the arrangement of our farm steadings, for it is only under cover that the perfect preservation of manure can be effected, or all those precautions taken which are required to protect it from loss. Such opinions, however, though they are consistent with theory, and are borne out by the observations made on the superior value of the manure produced by the system of box feeding, and other similar plans, have not as yet been sufficiently substantiated by experiment. So far as I know, we have only one experiment on the comparative value of manure made under cover and without, that of Mr. Campbell of Craigie, to which I referred at the meeting, and I mention the matter again here, because it would be doing a good service to the progress of agriculture if any of our members could be induced to institute an extended series of experiments on this subject. The condition in which farm-yard manure should be applied is a question which has been fully discussed by several of the speakers, and the general opinion is, that in autumn it should be applied pretty fresh, but that in spring it should be well and thoroughly rotted. Such, I need scarcely say, is the general opinion, and it is that also to which we should be directly led by theoretical considerations. The rotting of manure is, in fact, the conversion of its nitrogen into ammonia, the state in which it is absorbed by the plant, and when the manure is to lie long in the ground before that process is to take place, it is obvious that the less of its nitrogen that is converted into the condition of the volatile and soluble ammonia the less likely will it be to lose by the protracted exposure to the vicissitudes of the winter. Exactly the reverse of this should be the farmer's object when he applies his manure in spring. He must then endeavour to have as much of its nitrogen in the form of ammonia as possible, as we know well that the abundant supply of that substance is most valuable as giving a start to the young plant, and bringing it rapidly through the first stage of its tender existence. Such should obviously be the system, where farm-yard manure alone is to be employed, but it is worthy of observation that the rotting or fermentation of manure can scarcely be carried on without at least some loss of ammonia, and it has frequently struck me, that now we can obtain guano, sulphate of ammonia, and the ammoniacal manures, theoretically, the best and most economical method of applying farm-yard manure, would be to use it unrotted, and to mix with it a sufficient quantity of one or other of these substances to supply the ammonia requisite for starting the plants. Mr. Main communicated to the meeting the results of a very interesting experiment, in some respects confirmatory of this view, for he found that the best results were produced when a smaller quantity of manure was employed along with a certain proportion of guano. All the manure he applied in this experiment was, however, well rotted; but he gives the results of another experiment in which equal quantities of rotted and recent manure were employed for Turnips, and the latter produced by much the best effect. This experiment and its results are certainly at variance with what has hitherto been the practice established by experience, and I trust it will be carefully repeated, because, should the results be confirmed, it will create a very great change in our agricultural practice. In fact, Mr. Main finds that 28 tons of recent manure produce a better effect than 28 of rotten; but any one acquainted with the management of a dung-heap knows that 28 tons of well-rotted manure correspond to a much larger quantity, perhaps 35 tons, of the recent manure, so that if Mr. Main's experiment be confirmed, not only will the application of the manure in a recent state produce a better crop, but there will be also a very great economy in the quantity employed. The question is one of great importance, and should not be lost sight of by our practical men. It would occupy too much time if I were to attempt entering upon the observations made by the speakers regarding the other manures made upon the farm; but attention was directed to several other sources of manure, which, though of less importance than that of cattle, should not be neglected. Poultry manure was particularly alluded to, and estimated at about half the value of guano, which is probably not far from the truth, and it seems to me that its production is worthy of more attention than it has hitherto met with in Scotland, and might be coupled with the feeding of poultry, which would be a profitable matter in the neighbourhood of large towns. Compost heaps were also touched upon by some of the speakers, though none enlarged upon their management; and allusion was also made to the importance of collecting vegetable and animal refuse of all kinds whatever; nothing in fact which is organic ought to be neglected, and the manure heap, as Mr. Finnie well observed, should be like the purse of the miser, in which should be collected every thing that meets the farmer's eye, as he may be assured, that however trifling it may be, everything he adds to it will go eventually to make his profits.—The last discussion on Grass and Clover seeds, for hay-making and pasturage, we have not yet published in our Journal, but shall do so as soon as room is possible.

## Calendar of Operations.

JUNE.

LAMMERMUIR SHEEP FARM, *June* 3.—The unpropitious circumstances under which May opened, arising from snow, sleet, and cold rain, soon gave way to more cheerful prospects; and if the weather has not been so genial as we have frequently seen it, yet it has been dry—an extreme of this being what the Lammermuir hills rarely complain of; still, as it has only been during the last fortnight that the thermometer has kept at, or a little above, temperate, the pastures are by no means rough. The sheep, however, have enough to be doing with, and are healthy, as well as improving in appearance. The lambing being over, we can now pronounce our crop to be an average one. With the exception of a few of the youngest lambs, the joint operations of castrating, docking, and ear-marking have been got through. The state of the atmosphere, this season, was particularly favourable for this work, being cool—extremes of heat or cold being frequently followed by severe loss. Though the principle on which many agricultural operations are performed by different men be the same, the result is frequently considerably influenced, according as the working of the details is more or less carefully attended to. To one little acquainted with the management of sheep stock, it may appear a very trifling matter, whether in such an ordinary business as docking and castrating a few lambs, the tails be kept "long" or "short," or the scrotum be "slit" or "topped," and yet, as these things are attended to, will the after appearance, and consequently, the value of the flock be affected. As the tails of the black-faced breed are naturally short, these are never interfered with; and as lowland breeders should know best what "cut" suits them, our remarks refer to Cheviots only. These, we think, should have their tails cut away exactly at the hocks, care being also taken to have them all of a uniform length. If removed much higher up than this point, it gives to the body of the sheep an appearance of shortness, which it would not otherwise have. Besides being considered a point of beauty in the Cheviot to have a well covered broad tail, a "good tail" also serves the important purpose of protecting the animal during the cold storms to which it is so much exposed. In castrating, we prefer "slitting" to "topping;" for, although by the latter method any matter which may collect can more readily escape, yet this takes place so seldom as to be of little consequence, while, when the animals come to be fed, although equally fat in other respects, those which have been slit will be found to be much better filled up below; this, at least, pleases the butcher, which is not always very easily done. With the exception of the rams, and a few odds and ends kept in the enclosures, sheep-shearing will not be begun in good earnest till towards the end of this month. The fresh growth of wool is not yet sufficiently advanced, and sudden unfavourable changes are of too frequent occurrence in hill districts to venture upon divesting them of their fleece in a hurry. Of this we have abundant evidence since we began writing, the wind having shifted from west to east, and the thermometer falling from 55° to 40°, with heavy rain. We have got 18 acres of Turnips sown, consisting of a few white Globes and Swedes, the rest of green top yellows, a variety we find to be admirably adapted for our climate. From the dry state of the soil, very few have hitherto brairded; now, however, they have plenty of moisture, and with heat following, they will soon be above ground. We have still a considerable quantity to sow, but as the ground is either already prepared, or will require little work to put it in order, another fortnight should finish our Turnip sowing. Oats are not looking so well as we could wish. Many of them were late in being sown, and want of rain has hitherto retarded their progress. This year we had a few acres drilled on a piece of ground much infested with annual weeds; and these look better than some sown broadcast on the same field, though this may be owing, in some measure, to the former being on the best soil. At present they are being hoed. The cattle are now at Grass; and the milking calves are turned out during the day, but brought under cover at night, when they receive Clover hay and a small quantity of bruised Oats. *A Lammermuir Farmer.*

## Notices to Correspondents.

CHARCOAL: *F Benson.* The cheapest plan is to light a peat fire, and continually cover it over with dry peats as it gets red-hot

through, until you have a large red-hot fire, and then quench it with water; or, you may make a kiln in the edge of the bog, and get a more perfectly red-hot mass of peat in this way, quenching it as soon as it is perfectly red through out.

CHICKENS: *F B.* We do not imagine that it is any pernicious *weed*, found in the woods close by, which causes your chickens to die of "the gapes," but should still advise you to shift them to fresh ground immediately, as well as to see that they are carefully protected from the wet.

COW FEED: *G T.* The answer to your question must depend upon the quantity of brewers' grains you purpose to give. A large cow will eat about 30 tons of green food per annum, which will in general require for its production an acre of land under arable cultivation. A good short-horn cow may produce 800 gallons of milk per annum.

CURE FOR BITE OF VIPER IN SHEEP: *George Summers.* Camphorated olive oil. *W. C. S.*

DRUMHEAD CABBAGES, &c.: *Sub.* We have just finished setting ours about 30 inches apart every way, requiring nearly 7000 plants per acre; but on richer land a yard apart would be close enough, requiring 4840 plants per acre. We expect to have these plants ripe in October and November. The seed should be sown in February and March; Rape seed should be sown now for use in autumn. Sows are kept in general till after their third litter. Ewes are kept to different ages, according to the breed. Ram-breeders will sometimes keep them as long as they will bear a lamb. Commonly they are fattened off after their second or third lamb. One acre of Cabbages will yield more keep than an acre of Rape.

GLASS CHURNS: *E G Caithcary.* They are perfectly efficient; but we cannot say anything on their merits relatively with those of the wooden box churns.

HOP PLANTS: *Arborist.* They are generally raised from cuttings; if raised from seed they must be *proved* before they can be depended upon, for not one in 50 of the varieties you would then obtain would be worth keeping. Any of our principal seedsmen could introduce you to Hop-growers from whom cuttings might be had.

INSURANCE SOCIETIES: *E B.* There are two insurance societies. Apply to Mr. Shaw, of the Strand, for the one; and the secretary of the Agricultural Cattle Insurance Company, London, for the other.

MR. ROWLEY'S DRILL: *Anon.* This machine, mentioned at page 346, is manufactured by Thomas Cuckson, of Worksop. Mr. Rowley, named as of Cuckson, near Worksop, resides at Hawthorn, near Chesterfield.

STAIN FOR WOODWORK OF STABLES: *T D.* Stockholm tar, heated, and applied with a brush, is a good stain and preservative for stalls and mangers. *W. C. S.*

STEAM ENGINE: *A Sub* can obtain one of low power for from 15*l.* to 25*l* per horse-power. Our steam-engine of about six-horse power (stationary), with a boiler for 10-horse power—all new, cost 225*l.* fixed. You can have one—a locomotive—from Lincolnshire makers for from 160*l.* to 250*l*, according to build and quality.

THRESHING MACHINE: *Dec.* Short straw, very productive, may yield to a 6 horse-power engine, in a good threshing machine, 40 bushels of Wheat per hour. But the quantities of which you hear depend more on the character of the material that is being threshed than of the machine employed for the purpose.

VETCHES: *Juvenis.* Cut them before they are out of blossom. They will make good hay, which must be made as in the case of Clover, with as little turning as possible.

# Markets.

## COVENT GARDEN, JUNE 21.

Trade is now steady, and the market well supplied with all kinds of Fruit and Vegetables in season. Forced Peaches and Nectarines have been sent in unusually large quantities. English Pines and Hothouse Grapes are plentiful and good. Keens' Seedling Strawberries have made their appearance from the open ground. Cherries are cheaper. West Indian Pines fetch from 2s to 5s. each. Oranges and Lemons are plentiful. Nuts remain nearly the same as quoted last week. Asparagus, young Carrots, French Beans, and Green Peas are received in quantity. Frame Potatoes may be obtained at 2d. to 4d. per lb. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1s. 3d. per pottle. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis floribunda, Cinerarias, Pinks, Moss and Provins Roses.

### FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 6s to 10s | Almonds, per peck, 6s |
| Grapes, hothouse, p. lb., 4s to 8s | — sweet, per lb., 2s to 3s |
| Peaches, per doz., 12s to 24s | Lemons, per doz., 1s to 2s |
| Nectarines, per doz., 10s to 24s | Oranges, per doz., 9d to 2s |
| Cherries, per lb., 3s to 6s | — per 100, 6s to 14s |
| Melons, each, 4s to 8s | — Seville, p. 100, 7s to 14s |
| Strawberries, p. pottle, 1s to 6s | — — p. doz., 1s to 2s 6d |
| Gooseberries, per half sieve, 2s to 3s | Nuts, Barcelona, p. bsh, 20s to 22s |
| Currants, per hf. sieve, 3s to 4s | — Brazil, p, bsh., 12s to 14s |
| | Cobs, per 100 lbs., 50s to 55s |

### VEGETABLES.

| | |
|---|---|
| Cabbages, per doz., 6d to 1s | Shallots, per bunch, 3d to 4d |
| Greens, per doz. bunchs., 6d to 1s 6d | Garlic, per lb., 4d to 8d |
| Cauliflowers, p. doz., 2s to 4s | Artichokes, per doz., 1s 6d to 2s 6d |
| French Beans, p. 100, 1s 6d to 2s 6d | Lettuce, Cab., p. score, 4d to 9d |
| Beans, p. hf. sieve, 1s 6d to 2s 6d | — Cos, per score, 3d to 1s |
| Peas, per sieve, 2s 6d to 3s 6d | Small Salads, p. punn., 2d to 3d |
| Asparagus, per 100, 1s to 4s | Horse Radish, p. bundl., 1s 6d to 6s |
| Rhubarb, p. bundl., 2d to 6d | Red Beet, per doz., 6d to 1s 6d |
| Potatoes, per ton, 90s to 200 | Mushrooms, p. pot., 8d to 1s |
| — per cwt., 4s to 8s | Sorrel, per hf. sieve, 6d to 9d |
| — per bush., 1s 6d to 3s | Fennel, per bunch, 2d to 3d |
| Turnips, p. bunch, 6d to 1s | Savory, per bunch, 2d to 3d |
| Cucumbers, each, 3d to 1s | Thyme, per bunch, 2d to 3d |
| Radishes, per doz., 6d to 9d | Parsley, per doz. bun., 2s to 3s |
| — Turnip, p. doz., 8d to 1s | — Roots, p. bundl. 9d to 1s |
| Celery, p. bundle, 6d to 2s | Mint, green, per bunch, 4d to 6d |
| Carrots, per bunch, 6d to 1s | Basil, green, p. bunch, 6d to 9d |
| Spinach, per sieve, 9d to 1s | Marjoram, green, do., 6d to 9d |
| Onions, p. bunch, 2d to 4d | Watercress, p. 12 bunch., 6d to 9d |
| Leeks, per bunch, 3d to 4d | Corn Salad, p. hf. sieve, 1s to 1s 6d |

## HOPS.—FRIDAY, June 20.

Messrs. Pattenden and Smith report that there is an active trade for all sorts of Hops, at an advance of fully 5s. per cwt. since this day week. The accounts from the plantations this morning are worse. Fly and lice are rapidly increasing, followed by honey-dew.

| | | | |
|---|---|---|---|
| Mid & East Kents | 90s to 140s | Sussex ... ... | 88s to 100s |
| Weald Kents ... | 90 — 110 | Yearlings & old Hops | 20 to 50 |

## POTATOES.—SOUTHWARK, June 16.

The Committee report that there have been a few arrivals since our last report coastwise, and a considerable quantity by rail. Trade still continues dull, except for the best samples. The following are this day's quotations:—York Regents, per ton, 60s. to 100s.; Scotch do., 40s. to 75s.; ditto Cups, 60s. to 75s.; Scotch Cathbolics, 40s. to 50s.; Lincolnshire, 40s to 50s.; Jersey, 40s.; foreign whites, 40s. to 60s.

## HAY.—Per Load of 36 Trusses.

SMITHFIELD, June 19.

| | | | |
|---|---|---|---|
| Prime Meadow Hay | 72s to 80s | Clover ... ... ... | 75s to 90s |
| Inferior ditto... ... | 55 65 | Second cut ... ... ... | 75 85 |
| Rowen ... ... ... | 55 65 | Straw ... ... ... | 25 30 |
| New Hay ... ... | — — | J. COOPER. | |

The supply short, but quite equal to the demand.

CUMBERLAND MARKET, June 19

| | | | |

## COAL MARKET.—FRIDAY, June 20.

Holywell, 13s. 6d; Eden Main, 13s.; Tanfield New, 12s; West Hartley 13s. 6d.; Wallsend Tees, 14s. 3d.—Ships at market, 13s.

## SMITHFIELD, MONDAY, June 16.

The supply of Beasts is good, and although the weather is favourable, trade is very slow. Prices on the average are lower than on Monday last. We have about an average number of Sheep and Lambs; the demand is very limited, and late rates are with difficulty maintained. Good Calves are in demand, but we cannot quote more than 4s., although it is exceeded in a few instances. From Holland and Germany there are 349 Beasts 2110 Sheep, 188 Calves, and 24 Pigs; from France, 11 Beasts and 30 Pigs; from Scotland, 400 Beasts; from Norfolk and Suffolk, 2200; and 120 Sheep from Spain.

| Per st. of 8 lbs.— | s | d | s | d | Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|---|---|---|---|---|
| Best Scots, Herefords, &c. | 3 | 4 | to 3 | 6 | Best Long-wools | ... | | | |
| Best Short-horns | 3 | 0 | — 3 | 4 | Ditto Shorn | ... 3 | 4 | to 3 | 6 |
| 2d quality Beasts | 2 | 4 | — 2 | 10 | Ewes & 2d quality | ... | | | |
| Best Downs and Half-breds | ... | | | | Ditto Shorn | ... 2 | 8 | — 3 | 2 |
| Ditto Shorn | ... 3 | 8 | — 3 | 10 | Lambs | ... | 4 | 6 — 5 | 4 |
| | | | | | Calves | ... | 3 | 0 — 4 | 0 |
| | | | | | Pigs | ... | 2 | 8 — 3 | 8 |

Beasts, 3778; Sheep and Lambs, 29,880; Calves, 323; Pigs, 427.

FRIDAY, June 20.

The number of Beasts is large and demand small; they cannot therefore be all sold. A few choice ones make 3s. 6d., but it is an extreme quotation. The supply of Sheep exceeds the demand, and although 2d. per 8 lbs. reduction is submitted to, many remain unsold. Trade is dull for Lambs; middling ones are unsaleable, but choice ones can be sold. There is a large number of Calves, but good ones are not over plentiful, consequently some make nearly 4s. From Germany and Holland we have 164 Beasts, 780 Sheep, 292 Calves, and 81 Pigs; from Norfolk and Suffolk, 400 Beasts; and 105 milch cows from the home counties.

| Per st. of 8 lbs.— | s | d | s | d | Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|---|---|---|---|---|
| Best Scots, Herefords, &c. | ... 3 | 2 | to 3 | 6 | Best Long-wools | ... | | | |
| Best Short-horns | 3 | 0 | — 3 | 2 | Ditto Shorn | ... 3 | 2 | — 3 | 4 |
| 2d quality Beasts | 2 | 2 | — 2 | 8 | Ewes & 2d quality | ... | | | |
| Best Downs and Half-breds | ... | | | | Ditto Shorn | ... 2 | 6 | — 3 | 0 |
| Ditto Shorn | ... 3 | 6 | — 3 | 8 | Lambs | ... | 4 | 6 — 5 | 4 |
| | | | | | Calves | ... | 3 | 0 — 3 | 10 |
| | | | | | Pigs | ... | 2 | 8 — 3 | 8 |

Beasts, 857; Sheep and Lambs, 15,220; Calves, 662; Pigs, 510.

## MARK LANE.

MONDAY, JUNE 16.—The supply of Wheat to this morning's market was small from Essex, but fair from Kent, and sold at an advance of 1s. per qr. upon the prices of this day week; a similar improvement was obtained on foreign, but business was not extensive. The market continues exceedingly bare of all descriptions of Spring Corn, and a slight enhancement on late prices is obtained. Flour is held for an advance of 6d. to 1s. per sack, which prevents transactions from being large.

| PER IMPERIAL QUARTER. | s. | s. | | s. | s. |

FRIDAY, JUNE 20.—The arrivals of foreign grain since Monday have been larger than for some weeks past, and a fair business was transacted in Wheat at the extreme rates of that day, which will also apply to English.—Barley sells less freely.—In the value of Peas and Beans there is no alteration.—The Oat trade is low, and prices must be written 6d. per qr. lower. The late advance on Flour is fully maintained to-day.

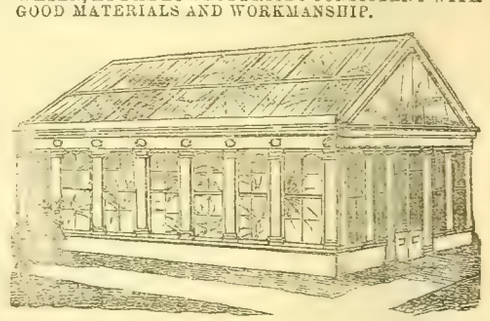
LIVERPOOL, TUESDAY, JUNE 17.—The arrivals of grain and Flour from Ireland and coastwise this week are again small, and exports large. The arrivals from foreign ports are very moderate, and not equal to the consumption. The advance on last Tuesday's quotations may be called fully 4d. per bushel on Wheat, 1s. 6d. to 2s. per barrel and sack on Flour, 2d. per bushel on Oats, 1s. 6d. per load on Oatmeal, 1s. per qr. each on Beans and Peas, and 2d. per bushel on Barley. Indian Corn has not participated in the excited demand, but it is, nevertheless, 6d. per qr. higher than last week.—FRIDAY, JUNE 13.—This morning's Market was well attended, and a great business resulted in Wheat and Flour. The advance on Wheat has been fully 1d. per bushel, 3d. to 6d. per barrel on American, and 1s. per sack on French Flour. Indian Corn was not dearer. Oats improved 1d. per bush., and Oatmeal 6d. per load. Barley, Beans, and Peas brought full prices.

COCHIN CHINA EGGS AND BIRDS.—Fresh Eggs from these fine and prolific Birds will be sent out on application to Mr. H COPLAND, Chelmsford, Essex, and securely packed, at 10*s.* 6*d.* a set of 13 Eggs, box included.

H. C. will also have some fine young Birds to dispose of. Particulars on application.

BY HER MAJESTY'S ROYAL LETTERS PATENT.



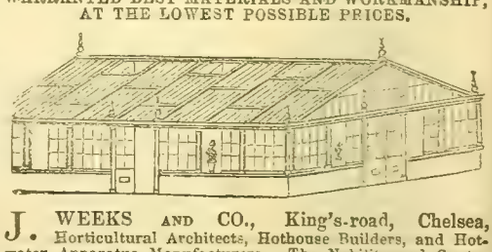
GALVANISED SHEET-IRON GREENHOUSES, HOTHOUSES, CONSERVATORIES, &c.

E. DENCH, Inventor, Patentee, and Sole Manufacturer, King's-road, Chelsea, who now offers 10*l.* to any person that can show a House of Grapes, equal for Quality, Quantity, and in proportion to space and age of Vines, as Mr. Thomas Frost, Head Gardener to Edward L. Betts, Esq., Preston-hall, which is a Galvanised Sheet-iron House, built and heated by himself. The superiority of these Houses having been fully proved in all parts of the Kingdom, references can be given in every instance where a Patent House has been erected. E. D. has at present five Patent Houses of different sizes for sale, and some at a greatly reduced price, thinking of making alterations on the premises, and has erected two Patent Greenhouses in the open space of the Great Exhibition; one the roof glaized without putty or wood, and one with putty. Heating by Hot-water.

GREENHOUSE AND CONSERVATORY BUILDING ESTABLISHMENT, HOT-WATER APPARATUS MANUFACTORY, KENSALL-GREEN, HARROW-ROAD, LONDON.

JOHN TAYLOR begs most respectfully to call the attention of the Nobility, Gentry, and Gardeners, to the very superior manner in which he erects all kinds of Greenhouses, Conservatories, Forcing Pits, &c., and all other buildings for Horticultural purposes, combining all the most modern improvements with elegance and utility. His manner of heating Horticultural Buildings, Churches, Chapels, Public Buildings, Entrance Halls, &c., has received the greatest approbation from the Nobility and Gentry by whom he has been extensively engaged

HORTICULTURAL BUILDING AND HEATING BY HOT-WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which for elegance of design, good materials and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP, AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abethaw Lime, and Roman Cement. Fine Black, 25*l.* per ton, and Rich Purple-brown, 20*l.* per ton.—Offices of the Company, 1, New Broad-st., London.—JOHN A. WEST, Secretary.

DR. NEWINGTON'S PATENTED AGRICULTURAL IMPLEMENTS. These Patents having been assigned to Mr. Gabriel, C.E., &c., of the Surrey Chambers, Arundel-street, Strand, London; agriculturists are informed that specimens of the Implements, viz.—The Hand Cultivators, Dibbles, Hand and Horse Drills, Manure Distributors, single-horse Ploughs, &c., can be seen there, as well as in the Agricultural Implement Department in the Great Exhibition, Hyde-park. N.B. The Patent Dibble obtained the Prize awarded by the Royal Agricultural Society at Norwich, in 1849.—Catalogues, with engravings of the Implements, and numerous Testimonials, can be obtained upon application at the Surrey Chambers, Arundel-street, Strand, London.

THE STANWICK NECTARINE.

MR. J. C. STEVENS will Sell by Auction, from 50 to 60 fine Plants, in pots, of this valuable Fruit Tree, on TUESDAY, July 1, at his Great Room, 38, King-street, Covent-garden, on account of the Fund forming by his Grace the Duke of Northumberland, in aid of the Gardeners' Benevolent Institution.—Catalogues of Mr. J. C. STEVENS, 38, King-street, Covent-garden, London.

---

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

---

TO BE SOLD OR LET ON LEASE FOR 99 YEARS OR LESS. TO GENTLEMEN'S GARDENERS DESIROUS OF ENTERING INTO BUSINESS, NURSERYMEN, OR FLORISTS.

TO BE SOLD OR LET, immediately, at Michaelmas, or within 12 months from this date, a very compact Horticultural Establishment, consisting of about 12,000 feet of glass erections, nearly new, having all been erected since 1843. The whole of the Pits and Houses are heated by hot water; there is an excellent Dwelling house on the premises, in good repair, consisting of 12 rooms, which are so arranged as to accommodate two families, if required. The construction of the houses and situation is very desirable for persons wishing to cultivate Plants for market, or attending to the business of looking after small gardens, being situated on the main road from London to Brentford, and within four miles of Piccadilly. A Lease for 90 years can be granted by the present proprietor, if required, whose great increase of professional business from home is the only cause of this desirable property being disposed of. This offers an excellent opportunity for two persons wishing to enter into the Nursery business.—For further particulars apply to A. Z., at the Office of this Paper.

---

HOTEL, WITH FARM.

TO BE LET, for a term of years, the commodious FAMILY HOTEL, and 110 ACRES of excellent LAND, situated at Hunstanton, St. Edmund's, on the west Coast of Norfolk, the well-known Cliffs and Sands of which are the favourite resort of visitors and families during the summer and bathing season. Occupation of the Hotel may be had immediately, and of the Land at Michaelmas next.

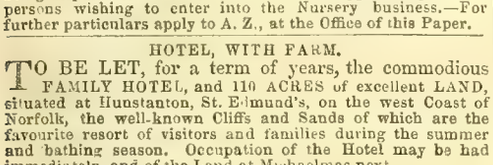
N.B. Plots of Ground to be let on Building Leases.

Apply, post paid, to Mr. GEORGE SMITH, Agent, Hunstanton, near Lynn, Norfolk.

---

HAYMAKING SEASON.—Look to your HAYMAKING MACHINES, that they are fit for use beforehand. Apply early for WEDLAKE'S, Original Patentee, still manufactured in a very superior manner for durability. Delivered free, at reduced charge, to meet the times' price.

MARY WEDLAKE, Widow, 118, Fenchurch-street, City, London, only maker.

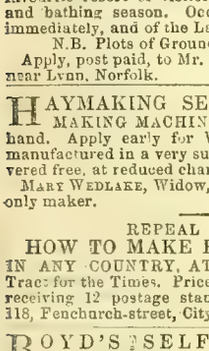


---

REPEAL OF CORN LAWS.

HOW TO MAKE HAY AT ANY TIME, AND IN ANY COUNTRY, AT HALF THE USUAL COST. A Tract for the Times. Price One Shilling. Forwarded free upon receiving 12 postage stamps.—Address to MARY WEDLAKE, 118, Fenchurch-street, City, London.

---



BOYD'S SELF-ADJUSTING SCYTHE,
(CLASS IX. OF THE EXHIBITION),

Can be put together and regulated to any angle by any person in one minute, without the assistance of a blacksmith; shuts up like a knife, and can be carried without danger. It effects a saving of 25 per cent. in labour, and can be used in an upright position if necessary. Manufactured and sold by DEANE, DRAY, and DEANE, Agricultural Implement Depot, Swan-lane, London Bridge; and to be had of all respectable Ironmongers.

---

FARM AND COTTAGE PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

| | |
|---|---|
| Patent Pump ... ... | £1 16 0 |
| Patent Pump, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing ... ... ... | 2 12 0 |

Larger sizes if required.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers.

JOHN WARNER & SONS,
8, Crescent, Jewin-street, London.

Every description of Machinery for Raising Water, Fire Engines, &c. The usual allowance to the Trade.

---

IN THE GREAT EXHIBITION,
Class 22, No. 267.

THE REGISTERED HYDROSTATIC SYPHON WATER PURIFIER.

This instrument is self-acting and self-cleansing, and only requires to be dropped into the Water, and the Pipe hung down outside, in which position it becomes a Syphon. It purifies Rain, River, Tank, Pond, or Pump Water, however dirty, completely separating all animalculæ, thus rendering it perfectly wholesome.

Invented, made, and sold by ALFRED BIRD, EXPERIMENTAL CHEMIST, 15, WORCESTER-STREET, BIRMINGHAM. Price 25s. each.

Sold by all Ironmongers and Chemists.

London Agents:—Messrs. DEANE and Co., and Messrs. EVANS and Co., Ironmongers, London Bridge, and Wenhamlake Ice Company, Strand.

---

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

*Patron*—His Royal Highness PRINCE ALBERT.
*President*—The Right Hon. Earl BATHURST.
*Vice-President*—The Right Hon. Earl DUCIE.

The COLLEGE will RE-OPEN, after the summer vacation, on MONDAY, AUGUST 11TH, for Agricultural and general Education. Lectures by professors of ability and experience, in Chemistry, Geology, Botany, Zoology, Veterinary Medicine and Surgery, Surveying and Civil Engineering, &c., are combined with practical instruction in Agriculture, and the several branches of a good education. Agricultural analysis will be undertaken in the Laboratory of the College at a low rate of charges.

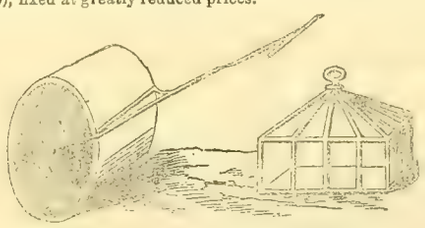
For prospectuses and information respecting the course of studies, terms, &c., for in and out students, apply to the PRINCIPAL, the Rev. J. S. HAYGARTH, M.A.

---

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.



---

COTTAM & HALLEN, ENGINEERS, IRON FOUNDERS, &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON.

COTTAM and HALLEN having had long experience in the erection of HOTHOUSES and CONSERVATORIES (made of Iron or of Iron and Wood combined), and from many improvements they have made during that time, can with confidence undertake to erect such buildings with economy and dispatch.

HOT WATER APPARATUS for heating the above and other buildings (of which they have constructed upwards of 3000), fixed at greatly reduced prices.

COTTAM and HALLEN have on show, at their repository, No. 2, Winsley-street, Oxford-street, a great variety of the following articles, for GARDENS, &c., at Greatly REDUCED PRICES, viz.:—

| | |
|---|---|
| Garden Rollers | Hand-glass Frames |
| Garden Engines | Flower Stakes |
| Garden Syringes | Flower-bordering |
| Watering Pots | Flower Stands |
| Garden Vases | Garden Arches |
| Mowing Machines | Garden Chairs |

Every description of Work, both Plain and Ornamental, in wrought and cast iron, for Gardens, &c., &c.

HORTICULTURAL TOOLS and AGRICULTURAL IMPLEMENTS of all kinds.

STRONG IRON HURDLES, strained Wire Fencing, &c.

Show Rooms at the MANUFACTORY, 2, Winsley-street, and 76, Oxford-street, three doors West of the Princess's Theatre.

---

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-poor Paint ever invented, for the preservation of every description of Wood, Iron, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON and SON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange, London.

No Agents.—All orders are particularly requested to be sent direct.

---

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus possesses greater general advantages than any yet submitted to the public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the apparatus. B. and H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. May be seen in daily use at the Craven Hotel, Craven-street, Strand; Stevens' Hotel, Bond-street; Greenwich Hospital; University College Hospital; and is in use by upwards of 200 private families, and at the Manufactory, 130, Fleet-street, London. A prospectus can be forwarded upon application, detailing particulars and price.

---

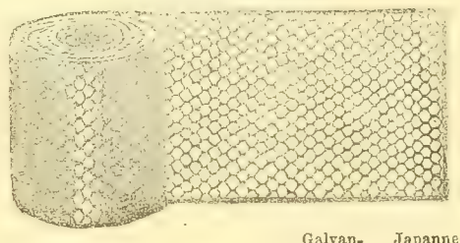
FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.

PATENT VULCANISED INDIA-RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and Manufacturer, Goswell Road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use; are particularly suitable for Fire Engines, and are found exceedingly useful in dwelling-houses for conveying Hot or Cold Water to Baths, &c.

Testimonials and prices may be had on application to the Manufactory.



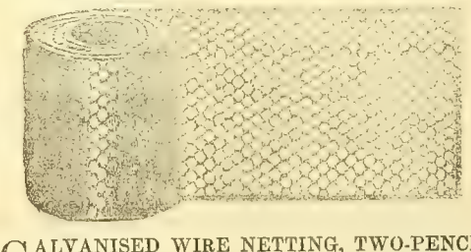
N.B.—Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

All Letters or Orders addressed to J. L. HANCOCK, Goswell Mews, Goswell Road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boats, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

---

GALVANISED WIRE GAME NETTING.—
7*d.* per yard, 2 feet wide.



| | | Galvanised. | Japanned Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24-inch wide | ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch " strong " | ... | 9 " | 6½ " |
| 2-inch " extra strong " | ... | 12 " | 9 " |
| ⅝ inch " light " | ... | 8 " | 6 " |
| 1⅛-inch " strong " | ... | 10 " | 8 " |
| 1⅛-inch " extra strong " | ... | 14 " | 11 " |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

---

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

| | | | | | |
|---|---|---|---|---|---|
| 12 inches wide | 3*d.* per yard. | | 30 inches wide | 7½*d.* per yard. | |
| 18 " | " | 4½*d.* " | 36 " | " | 9*d.* " |
| 14 " | " | 6*d.* " | 48 " | " | 1*s.* " |

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames: Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each. Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

---

IRON GATES, HURDLES, WIRE WORK, &c.

THOMAS PERRY AND SONS,
252, OXFORD-STREET (NEAR HYDE-PARK),
And Highfield Iron-works, Bilston,

MANUFACTURE all kinds of Park Entrance, Carriage and Field Gates, Wickets, Wrought and Cast Iron Gate Pillars, Plain and Ornamental Fencing, Palisading, and Balconies. Ox, Cattle, Sheep, and other Hurdles.

Tree Guards, Garden Seats, Garden Rollers, Wheelbarrows. Stable Fittings, &c.—Iron Work of every description.

Wire Work in great variety, comprising Gothic and other Fencing, Flower Stands, Trainers, Arches, Pheasantries, &c.

The works being situated in the centre of the Staffordshire Iron district, THOMAS PERRY AND SONS are enabled to execute promptly orders to any extent with the greatest facility, of the best quality, and on the most moderate terms.

Manufacturers of every kind of Solid Iron and Tube BEDSTEADS, with all the recent improvements.

---

A CLEAR COMPLEXION.

GODFREY'S EXTRACT OF ELDER FLOWERS is strongly recommended for softening, Improving, Beautifying, and Preserving the SKIN, and in giving it a blooming and charming appearance, being both a most fragrant perfume and delightful cosmetic. It will completely remove Tan, Sunburn, Redness, &c., and by its balsamic and healing qualities, render the skin soft, pliable, and free from dryness, scurf, &c., clear it from every humour, pimple, or eruption; and, by continuing its use only a short time, the skin will become and continue soft and smooth, and the complexion perfectly clear and beautiful. Sold in bottles, price 2*s.* 9*d.*, with directions for using it, by all Medicine Vendors and Perfumers.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where Roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance of Westminster Hall, were roofed with F. M'NEILL and Co's Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

---

ZOOLOGICAL GARDENS, REGENT'S PARK.—An ELEPHANT CALF and its MOTHER have been added to the Collection, and are exhibited daily, together with the HIPPOPOTAMUS, presented by His Highness the Viceroy of Egypt. The Band of the First Life Guards will perform, by permission of Colonel Hall, at 4 o'clock, on every Saturday, until further notice. Admission 1s. ON MONDAYS 6d.

---

NEW SHOW ROOMS FOR BEDSTEADS.

HEAL AND SON have erected some extensive Warerooms for the purpose of keeping every description of Bedsteads. In Iron their Stock will include every sort manufactured, from the cheap Stump, for servants' use, to the handsomely ornamented tubular-pillared Canopy, as well as Brass Bedsteads of every shape and pattern; and in wooden Bedsteads their Rooms are sufficiently extensive to allow them to fit up a variety, both in Polished Birch and Mahogany, of Four-post, Canopy and French, and also of Japanned Bedsteads—in fact, to keep in Stock every sort of Bedstead that is made; and they have also a general assortment of Furniture Chintzes, Damasks, and Dimities, so as to render their Stock complete for the Furnishing of Bedsteads as well as Bedding. And without attempting to compete with the prices at which the lowest class of Furniture is sold, and which is fit for no useful purpose, their new Stock will be found to be priced on the same principle by which their Bedding Trade has, during the last 30 years, been so successfully extended, and the goods, whether of a plain and simple pattern, or of a handsomer and more expensive character, are of well-seasoned materials, sound workmanship, and warranted.

HEAL and SON'S List of Bedding, containing full particulars of Weights, Sizes, and Prices of every description of Bedding, sent free by post, on application to their Factory,

196 (opposite the Chapel), Tottenham Court Road, London.

METCALFE AND Co's NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1s. An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co's, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2s. per box. CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church row, Stoke Newington, both in the County of Middlesex, Printers, at their Office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles street, in the parish of St. Paul's, Covent-garden, in the said County where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, JUNE 21, 1851.

NORTH KENT HORTICULTURAL SOCIETY.—EXHIBITIONS will be holden at the Rosherville Gardens, Gravesend, on the 5TH JULY and 23D AUGUST, when Prizes of upwards of 150*l.* will be distributed.

Particulars of W. A. COOMBS, Esq, Hon. Sec., Northfleet, or 3, Bridge-street, Westminster.

THE VICTORIA REGIA IS NOW FLOWERING, GROWING IN THE OPEN AIR AT

J. WEEKS AND CO.'s, King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers.

EXHIBITION OF AMERICAN PLANTS—ROYAL BOTANIC GARDENS, REGENT'S PARK

JOHN WATERER (the principal Contributor to the above Exhibition), begs to say that his unrivalled Collection is still in full bloom, and may be seen gratis by Orders from Fellows of the Society.—The American Nursery, Bagshot, Surrey, June 28.

CATTLE DRUMHEADS (fine), warranted true, by THOMAS WELLAND, Surrey Gardens, near Godalming, Surrey.—Delivered at Godalming Station, 3*s.* 6*d.* per 1000, crates included. Cauliflowers 2*s.* 6*d.* per 100.

ROSES.

EDWARD DENYER, NURSERYMAN, Loughborough Road, Brixton, 3 miles from London, informs his kind patrons in general that his unrivalled collection of Roses, reaching to nearly 1000 varieties, is now in bloom, and free to the inspection of all visitors, Sundays excepted. Orders taken at this time, and executed in November next. Fruit and Ornamental Trees, &c., may also be seen in great varieties.

E. D. informs his friends that he has no Seed Shop in London.

ROSES.

ADAM PAUL AND SON, NURSERYMEN, &c., Cheshunt, Herts, beg to inform admirers of the Rose that their Collection will be in full bloom the end of June and beginning of July. A day may now be agreeably spent amongst the various collections of Plants and Trees at the Cheshunt Nurseries. Twenty Trains of the Eastern Counties Railway leave and return to London daily. The Cheshunt and Waltham Stations are equally convenient for reaching the Nurseries.

ROSES.

H. LANE AND SON'S extensive Collection will be in bloom about the 25th inst., and will continue during the season.—The Nurseries, Great Berkhampsted, Herts.

ROSES.

"SANGSTER'S FLORUMBRA," for the protection of choice Roses, when in bloom, from sun or rain, as well as for destroying the Green Fly, with the assistance of Brown's Fumigator, may be had wholesale of Messrs. BARBER and GROOM, London; and retail of most Seedsmen and Ironmongers in the Kingdom; and of W. and J. SANGSTER, at their Manufactory, 75, Cheapside. Price, 8s. Shades only, from 4*s.* each, or complete, from 7*s.* 6*d.* according to size. List of prices sent on application.

CHOICE CINERARIA SEED.

LUCOMBE, PINCE, AND CO, (have saved from a Select Collection of all the Newest and Finest Varieties of 1851, which they have this season grown to great perfection, some Cineraria seed, of excellent quality; and they beg leave to offer it for sale, in Packets sealed and warranted by them, at 2*s.* 6*d.* each, free by post. If sown soon, strong plants will be produced, which will flower in 1852.

Exeter Nursery, June 28 h.

NEW PLANTS FROM CALIFORNIA.

HENRY GROOM, Clapham Rise, near London, by Appointment FLORIST TO HER MAJESTY THE QUEEN, AND TO HIS MAJESTY THE KING OF SAXONY, begs to recommend to the notice of the Nobility, Gentry, and Public the following novelties, and to state that his CATALOGUE OF NEW PLANTS AND PELARGONIUMS will be forwarded, by post, on application.

CERASUS ILICIFOLIA, an EVERGREEN CHERRY, with beautiful dark green foliage. A most desirable plant. 7*s.* 6*d.* and 10*s.* 6*d.* each.

LAURUS REGALIS, a new BAY; very fragrant; an evergreen. 15*s.* each.

PAVIA CALIFORNICA, a new HORSE-CHESTNUT. 21*s.* each.

MYRICA, a new species from California. 10*s.* 6*d.* each.

He begs to say that he has a few strong plants of CERASUS ILICIFOLIA, fit to grow into specimens, at 21*s.* each,

## THE CARMINE-COLOURED WATER LILY.—

We have the satisfaction to inform our Patrons that the arrangements made in our new Aquarium for the culture of this and other beautiful Water Plants, have been very successful; and that we not only have the superb species named at the head of this notice flowering in a very superior manner every morning, but have also the gratification of daily showing to those who honour us with their visits seven or eight other kinds in singularly fine bloom, among them we may especially refer to—

| | |
|---|---|
| Nymphæa cyanea | Nymphæa dentata |
| ,, mexicana | ,, micrantha |
| ,, sanguinea | ,, esculenta |

All of which, those who love Exotic Water Plants, will recognise as possessing great beauty and rarity. We may also observe, that our Aquarium possesses two extremely vigorous plants of Sir Robert Schomburgk's celebrated introduction, the VICTORIA REGIA, one of which is now flowering in great perfection.

We shall esteem it an honour to show our Patrons, or their friends, these noble productions; and, therefore, most respectfully solicit their visits to see them and the other objects of interest our establishment may possess.

*** The new and beautiful scented Pæonies, rivalling the Rose in fragrance, are now blooming.

KNIGHT and PERRY, Exotic Nursery, King's-road, Chelsea.

ROSES.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WM. WOOD AND SON respectfully announce to their Friends and the public that the Collection of ROSES at Woodlands will be in fine bloom about the first week in July, and will continue flowering during the Rose season.

W. W. and Son here think it necessary to state, in justice to themselves, that their stock this season far surpasses in quantity (by many thousands), the display of former years. For the convenience of visitors, a raised platform has been erected, from which parties will be enabled to compass at one view a quarter of 10 acres covered with Roses in full bloom, presenting a *coup d'œil* perhaps never before witnessed in one garden.

Maresfield is situated 12 miles from Hayward's Heath, a station of the London and Brighton Railway, from whence conveyances to the Nursery may be obtained. Parties leaving London by an early train would reach Lewes in time for the 12 o'clock coach, which runs daily to Ringles Cross Gate, about two miles from the Nursery.

Woodlands Nursery, June 28.

H. DE LANGE AND SONS, FLORISTS, at Haarlem, in Holland, sell, at very reasonable prices, all sorts of FLOWER ROOTS, as double and single HYACINTHS, early and late TULIPS, NARCISSUS, double and single JONQUILS, ANEMONES, RANUNCULUS, CROCUS, AMARYLLIS, GLADIOLUS, &c., &c.

Catalogues to be had at the Office of Mr. N. BREEBAART, 45, Commercial Sale Rooms, Mincing-lane, London.

SELECTED CINERARIA SEED, saved from one of the choicest and finest varieties in cultivation, this being the proper time for sowing (which any amateur may cultivate with little trouble and sure success), to insure good strong plants that will bloom well the forthcoming season.

Packets of the above can be forwarded to any part, on receipt of 18 penny postage stamps.—EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath.

NEW DAHLIAS; E. FOSTER'S, Esq., CHOICE PELARGONIUMS; PICOTEES, CARNATIONS, HOLLYHOCKS, PANSIES, &c.

WILLIAM BRAGG, Star Nursery, Slough, begs to say his Catalogue of the above Flowers is now ready, and can be had on application. His choice SEEDLING DAHLIAS will be sent out the first week in May at 10*s.* 6*d.* each, viz:—

ADMIRAL, rich lilac, very constant, gained first Seedling prize, 25*s.*, at the Royal South London Exhibition; 21*s.* Shacklewell Open Shows, &c., fourteen first class certificates; the most successful flower of the year.

CARMINA, rich carmine, constant show flower, gained six first class certificates, &c., shown in several winning stands.

The Hon. Mrs. ASHLEY, waxy white, tipped with rose, splendid show flower, &c. W. B. thinks it the best Dahlia of the season; was awarded by Dr. LINDLEY a certificate of merit at the Horticultural Society, &c. Gained five first class certificates.

QUEEN OF FAIRIES, Domeyer. W. BRAGG has purchased the stock of this fine and constant fancy Dahlia, from the above amateur, who will give 5*l.* in prizes the next season for this flower. It gained a Seedling prize and first class certificate, with Edwards's Mrs. HANSARD; at the Royal South London Open Show Exhibition five first class certificates.

W. B.'s stock of Picotees, Carnations, and Pinks are strong and good; the best Hollyhock Seed ever sent out can be had in 2*s.* 6*d.* and 5*s.* packets, post paid, for prepayment.

PLANTS OF CABBAGE, SAVOY, KALE, BROCCOLI, CAULIFLOWER, AND CELERY.

JOHN CATTELL, NURSERYMAN AND SEEDSMAN, Westerham, Kent, begs respectfully to inform the public that Plants of his superior true sorts of the above are now ready, and will be forwarded, as usual, to order, on receipt of postage stamps or Post-office order, made payable here, at the under-named prices, basket or mat, and package included.

All the sorts of Early Cabbage, Savoy and Kale, including Brussels Sprouts, 4*s.* 6*d.* per 1000; all the sorts of Autumn and Spring Broccoli, 5*s.* 6*d* per 1000; all the sorts of Celery, 5*s.* 6*d* per 1000; Cauliflower, Early and Late, and Red Cabbage, 9*d.* per 100; Drumhead, or Cattle Cabbage, 3*s.* 6*d.* per 1000. 6*d.* per 1000 less, when no mat or package is required. Packages of 1000 and upwards delivered free of carriage to the Edenbridge Station of the South-Eastern Railway. A Circular, containing the sorts of the above, may be had on application, by enclosing a penny stamp.

Seed of CATTELL's Dwarf Barnes, and of his superior Dwarf Reliance Cabbage, may be had in packets, by post, for 12 penny stamps per packet, the former containing 1 oz. as usual, and the latter ½ oz.

ROSE NURSERIES, HERTFORD.

E. P. FRANCIS offers the following ROSES, on Dwarf worked Stems, well established in 32 and 24 size pots, full of bloom buds, strong and vigorous, fit for immediate clumping, at 2*s.* each, carriage paid to London.

It is respectfully requested that this List may be preserved for reference.

E. P. FRANCIS's extensive collection of Roses is now in full bloom; and an early inspection is respectfully solicited. Trains 8 times per day to Hertford. Morning and evening are the best times to inspect a collection of Roses; but blooms are exhibited at Mr. Clark's, 25, Bishopsgate-street, throughout the season.

June 28

G. P. TYE'S REGISTERED HYACINTH BOTTLE, WITH FLOWER SUPPORT.—The very favourable notice which this invention elicited when submitted to the Horticultural Society, the high opinion expressed by Dr. Lindley of its merits, and the satisfaction with which it has been hailed by many eminent florists, have fully established its claim to public favour.

The Horticultural Society's Meeting, May 18th, 1851.—"These are handsome, clever, contrivances; if cheap enough (the price not being sent), cannot fail to be universally approved of."

In leading article (with engraving), after describing the invention, Dr. Lindley remarks, "this is *by far* the most beautiful contrivance of the kind we have yet seen; and will, no doubt, universally displace the ugly things now in use."—*Gardeners' Chronicle, May* 10.

Birmingham and Midland Society, for the advancement of Floriculture.—A First Class Certificate awarded for it.

In a *critique* on the articles from Birmingham, in the "Great Exhibition," Class 22.—"The defects in the ordinary glass, so painfully apparent to all lovers of floriculture, are completely remedied in the improved stand, which has a firm broad base, and is furnished with an ingeniously contrived, but simple, apparatus, intended to maintain the flower in an upright position. These bottles are made in various coloured glass, are tasteful in shape, and are easily convertible, when not in use for Hyacinths, into flower vases, or else into appropriate ornaments for the drawing-room or toilette table."

May be obtained from Mr. JOHN POWELL, Trentham, Staffordshire; or Mr. G. P. TYE, the Inventor, Snow-hill, Birmingham.

HORTICULTURAL TOOL WAREHOUSE.

GREEN AND CONSTABLE, WHOLESALE and RETAIL IRONMONGERS, 36, King William-street (four doors from London Bridge), beg to inform Amateurs and Gardeners they have a large assortment of new and improved Garden Tools, including Lyndon's Patent Spades, Lord Vernon's Patent Hoes, jointed Hothouse Syringes, Galvanised Iron Garden Engines, Transplanting Tools, Patent Water-pots, Brown's Patent Fumigator, Improved Garden Labels and Sticks; also a large assortment of Saynor's Pruning and Budding Knives.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied and common pea-fowl, and pure China pigs; and at 3, Half moon-passage, Gracechurch-street, London.

GLASS. GLASS.

*Packed in boxes of 50 feet each.*

6 by 4 in. and 6½ by 4½ in., 12*s.* per box; 7 by 5 in. and 7½ by 5½ in. 13*s.* 6*d.* do.; 8 by 6 in. and 8½ by 6½ in. 15*s.* do.; 9 by 7 in., 9½ by 7½ in., and 10 by 8 in., 16*s.* 6*d.*

*N.B.—The Patent Rough Plate, one-eighth of an inch thick, is supplied in quantities 62 by 18 inches, for 10 feet span ridge and furrow roofs, at a reduced price.*

NOTE.—Squares are charged according to the superficial contents, except where the length exceeds the restriction above, in which case the higher price is charged irrespective of the contents.

*Bending.*—1-8*th*, 6*d.*; 3-16*ths*, 9*d.*; ¼ *inch*, 1*s. per foot, net.*

*Irregular shapes are charged as squares.*

*When Crates are ordered, the 30-inch widths will be sent, unless otherwise specified.*

THE PATENT ROUGH PLATE, one-eighth of an inch thick, and weighing 2 lbs. to the foot, has now become an article of very extensive and increasing consumption.

*It is universally admitted to be the best and most suitable Glass for Ridge and Furrow Roofs, Greenhouses, Factories, Workshops,*

And all such like purposes, and is a cheap and efficient substitute for Fluted or Obscured Glass, where the object is to intercept the vision without diminishing the light. Its non-transparency, strength, and cost (being no more weight for weight than Common Sheet Glass), render it eminently suitable for the Glazing of Conservatories and Roofs of all kinds; Blinds are unnecessary, and when used in Greenhouses *no scorching occurs.*

Where still greater strength is required the 3-16ths and ¼ inch thick will be found much cheaper than the Common Rough Plate. Samples will be forwarded on application, by applying to JAMES PHILLIPS & CO., HORTICULTURAL GLASS MERCHANTS, 116, BISHOPSGATE-STREET WITHOUT, LONDON.

### GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

### GLASS FOR PIT FRAMES, HOTHOUSES, &c.

in Boxes of 100 feet, 8*s.* 6*d.* each.

4½ by 3 ... 5 by 2½ ... 6 by 2½ ... 6 by 3½ inches.
4½ by 3 ... 5 by 3 ... 6 by 3 ... 6½ by 3
4½ by 3½ ... 5½ by 3 ... 6½ by 3 ... 6½ by 3½

Larger Squares increase in price according to size. Every size kept ready packed in boxes, and may be had at a moment's notice.

Extra Crown, Sheet, and Patent Rough Plate Glass, cut to size for Conservatories, Greenhouses, &c.

Gardeners and others glazing on Mr. Paxton's plan can be supplied with Sash-bars of any length for the purpose.

PROPAGATING, CUCUMBER, FERN, PEACH, and every description of Garden Glasses.

Bailiffs, Farmers, Dairymen, and others supplied with Lord Camoy's Milk Syphons, Milk Lactometers, Glass Milk Pans, Glass Tiles, Slates, &c., &c., for collections of which Messrs. COGAN and Co. were honoured with the Silver Medal of the Dublin Society, as also the Silver Medal of the Liverpool and Manchester Society held at Warrington in September last.

For Estimates, Prices, and further particulars, please address Messrs. COGAN and Co., 48, Leicester-square, London.

Glass Shades, Gas Glasses, White Lead, Colours, &c., as usual.

### GLASS.

THOMAS MILLINGTON'S FOREIGN SHEET GLASS is far superior to any other manufacture, as well as cheaper. In 100 feet boxes packed for immediate delivery.

6 inches by 4 and 6 inches by 4½, 14*s.* each.

16*s.* per box :

| | |
|---|---|
| 6 ins. by 5 and 7 ins. by 4 | 6½ ins. by 6 and 7 ins. by 6½ |
| 6 ,, 5½ ,, 7 ,, 5 | 6½ ,, 6½ ,, 7½ ,, 6½ |
| 6 ,, 6 ,, 7½ ,, 5 | |

18*s.* 6*d.* per box.

| | |
|---|---|
| 9 ins. by 7 and 11 ins. by 8 | 9 ins. by 9 and 12 ins. by 9 |
| 8 ,, 8 ,, 11 ,, 9 | 10 ,, 8 ,, 13 ,, 9 |
| 9 ,, 8 ,, 12 ,, 8 | |

And many other sizes, or cut to order in various thicknesses.

Cases containing large Sheets, in 100, 200, and 300 feet, at 21*s.* per 100 feet.

ROUGH PLATE, perfectly flat, ⅛ in. thick, best manufactured

In sizes under 15 inches ..... 6*d.* per foot.
,, ,, 35 ,, ..... 8*d.* ,,
,, ,, 50 ,, ..... 9½*d.* ,,
,, ,, 75 ,, .....12*d.* ,,

Milk Pans, 2*s.* to 6*s.* each; Metal Hand-frames, Glass Tiles and Slates; Cucumber, Propagating, and Bee Glasses; Wasp Traps, Glass Shades, and Plate Glass, at 87, Bishopsgate-street Without, same side as Eastern Counties Railway.—Established 100 years.

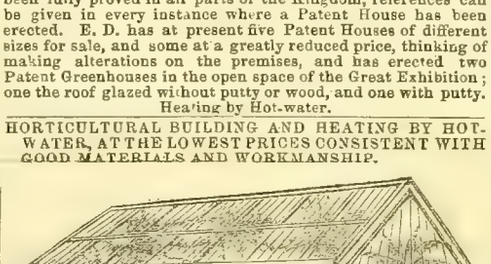
### GLASS WATER PIPES.

MESSRS. COATHUPE AND CO., CROWN and SHEET GLASS MANUFACTURERS, Nailsea, near Bristol, Somerset, beg to inform Engineers and others that they are supplying GLASS PIPES, with their Joints, from 1 to 4 inches bore, capable of bearing very great atmospheric pressure, in lengths from 3 to 7 feet, the lengths being less as the diameter of the bores increase. These Pipes may be seen at the Exhibition (Class 24, Section 47), with their forms and modes of joining, in the Section allotted to the Glass Manufactures; and references can be given of their great utility in numerous localities, where they have been successfully employed. The great advantage of Glass Pipes for the conveyance of pure water over all metallic substances, has been too largely dwelt upon by medical and scientific authorities to require any further comment.

Nailsea Glass Works, near Bristol.

### GREENHOUSES.

HENRY FREEMAN, HOTHOUSE BUILDER, and HOT WATER APPARATUS MANUFACTURER, Triangle, Hackney, London, begs to solicit the attention of the gentry to his low prices for cash. Good substantial-built Greenhouses, fixed complete, 42 feet long by 13 feet wide, 9 *l.*; 21 feet long by 13 feet wide, 50*l.*; 12½ feet long by 10 feet wide, 30*l.* A large assortment of Conservatories, Hothouses, Pits, Melon and Cucumber Boxes, Iron Hand-lights, Summer-houses, Seats, &c. Estimates in the above line, either in wood or iron.

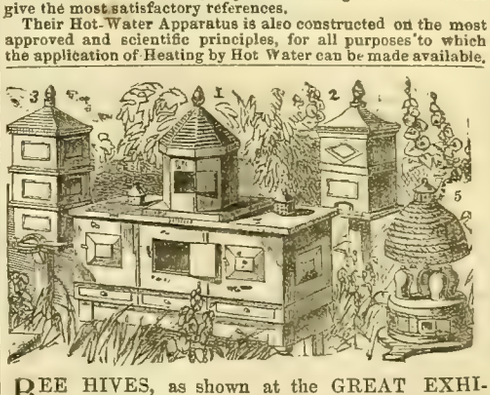


BY HER MAJESTY'S ROYAL LETTERS PATENT.

### GALVANISED SHEET-IRON GREENHOUSES, HOTHOUSES, CONSERVATORIES, &c.

E. DENCH, Inventor, Patentee, and Sole Manufacturer, King's-road, Chelsea, who now offers 10*l.* to any person that can show a House of Grapes, equal for Quality, Quantity, and in proportion to space and age of Vines, as Mr. Thomas Frost, Head Gardener to Edward L. Betts, Esq., Preston-hall, which is a Galvanised Sheet-iron House, built and heated by himself. The superiority of these Houses having been fully proved in all parts of the Kingdom, references can be given in every instance where a Patent House has been erected. E. D. has at present five Patent Houses of different sizes for sale, and some at a greatly reduced price, thinking of making alterations on the premises, and has erected two Patent Greenhouses in the open space of the Great Exhibition; one the roof glazed without putty or wood, and one with putty.

Heating by Hot-water.



### HORTICULTURAL BUILDING AND HEATING BY HOT-WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which for elegance of design, good materials and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BEE HIVES, as shown at the GREAT EXHIBITION of 1851, by GEO. NEIGHBOUR and SON, 127, High Holborn, London. No. 1, Nutt's Collateral Hive; 2, Improved Single Box-Hive; 3, Taylor's Amateur Bar-Hive; 5, NEIGHBOUR'S Improved Cottage Hive, working three or five Glasses; the Ladies Observatory Hive, &c. &c.

A priced Catalogue, with drawings and particulars, forwarded on receipt of two postage stamps.

AGENTS. — Liverpool: Wm. Drury, Castle-street. Manchester: Hall and Wilson, 50, King-street. Glasgow: Austin and M'Aslin, 168, Trongate.

### HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP, AT THE LOWEST POSSIBLE PRICES.

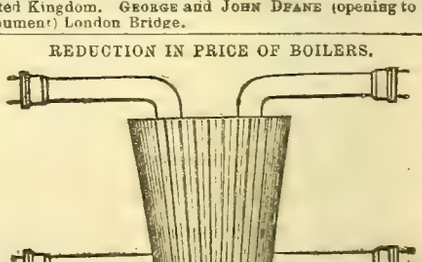
J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements. so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

STRAWBERRIES AND FRUIT TREES.—TANNED GARDEN NETTING, for protecting the above from birds, or as a fence for fowls, pigeons, tulip and seed beds, from JOHN KING FARLOW'S fishing tackle and net manufactory, 5, Crooked-lane, London-bridge, at 1½*d.* one yard, 3*d.* two yards, or 6*d.* four yards wide. Forwarded carriage free, on all orders over 20*s.*, accompanied with post-office order or stamps.



DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening pursuits, are invited to examine G. and J. DEANE'S extensive Stock of GARDENING AND PRUNING IMPLEMENTS, best London made Garden Engines and Syringes, Coalbrookdale Garden Seats and Chairs.

G. and J. DEANE are sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with the Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom.

Also, wholesale and retail Agents for Saynor's celebrated Pruning Knives, used exclusively by the first gardeners in the United Kingdom. GEORGE and JOHN DEANE (opening to the Monument) London Bridge.

### REDUCTION IN PRICE OF BOILERS.

BURBIDGE AND HEALY beg respectfully to inform their Friends, in consequence of the present reduced price of Iron, they are enabled to make a considerable reduction in the price of their Boilers. The price will be, now :

| | | | |
|---|---|---|---|
| 10 in. will warm | 50 ft. 4 in. pipe | ... | £1 15 0 |
| 12 in. do. | 75 ft. 4 in. do. ... | ... | 2 5 0 |
| 14 in. do. | 100 ft. 4 in. do. ... | ... | 2 15 0 |
| 16 in. do. | 150 ft. 4 in. do. ... | ... | 3 10 0 |
| 18 in. do. | 250 ft. 4 in. do. ... | ... | 4 10 0 |
| 21 in. do. | 350 ft. 4 in. do. ... | ... | 5 10 0 |
| 24 in. do. | 450 ft. 4 in. do. ... | ... | 7 0 0 |
| NEW PATTERN BOILERS. | | | |
| 30 in. will warm | 800 ft. 4 in. pipe | ... | 15 15 0 |
| 36 in. do. | 1500 ft. 4 in. do. ... | ... | 25 0 0 |

All Boilers with double arms, up to 18 in., 5*s.* extra; to 24 in., 10*s.* extra; all above, the same price.

130, Fleet-street, London.

PURVEYOR TO HER MAJESTY, H.R.H. PRINCE ALBERT, AND THE KING OF THE NETHERLANDS.

JOHN BAILY, 113, Mount-street, Grosvenor-square, London, Dealer in all sorts of USEFUL AND ORNAMENTAL POULTRY; Domesticated Wild Fowl; Gold, Silver, and common Pheasant Eggs for Hatching; all sorts of Fancy Fowls' Eggs, large Aylesbury Ducks, &c.

BAILY'S registered PHEASANT AND POULTRY FOUNTAINS, by which Birds are ensured a supply of clean and wholesome water, and the lives of thousands of Chickens and Pheasant Poults saved—1¼ quarts, 17*s.* 6*d*; 7 quarts, 15*s.* 6*d.*; 4 quarts, 13*s.* 6*d.* Drawings and particulars forwarded by post on application.

BAILY'S "Hints for the Management and Fatting of the Dorking Fowls for the Table," price 1*s.* 6*d.*

HORTICULTURAL SOCIETY OF LONDON.—His Grace the Duke of Devonshire, President of the Horticultural Society, has kindly directed the Grounds of Chiswick House to be opened for the reception of the Visitors to the Society's Gardens at the NEXT EXHIBITION, on SATURDAY, the 19th JULY. Tickets are issued to the orders of Fellows of the Society only, at this Office, price 5*s* ; or at the Garden, in the afternoon of the 19th July, at 7*s* 6*d* each, but then also only to orders signed by Fellows of the Society. But respectable strangers, or residents in the country, who will forward their addresses in writing to the Vice-Secretary, 21, Regent-street, on or before Thursday, the 17th of July, may obtain from that Office an authority to procure Tickets on this occasion. No official orders for Tickets will be issued after that day.

N.B.—No Tickets will be issued in Regent-street on the day of Exhibition.

Messieurs les étrangers qui desireront se procurer des billets d'admission pourront en obtenir des mandats en s'addressant à leur Ambassade ou à leur Consulate.

PRIVILEGE OF FELLOWS.—Each Fellow of the Society has free personal admission to these Exhibitions without a ticket. He or she may also personally introduce a friend with an Admission Ticket at half-past Twelve, at Gate No. 4, in the Duke of Devonshire's road; or, if unable to attend personally, a wife, brother, son, daughter, or sister, if resident in the family, may represent the Fellow, if furnished with an admission Ticket on which the signature of the Fellow is inscribed.

21, Regent-street, London.

ROYAL BOTANIC SOCIETY, Regent's Park.—The last EXHIBITION of PLANTS, FLOWERS, and FRUIT, this season, will take place on Wednesday next, July 2d. Tickets to be obtained at the Gardens, by orders of Fellows of the Society, or by letters from Foreign Ambassadors and Ministers, price 5*s*., or on the day of Exhibition, 7*s*. 6*d*. each. The Rose Garden is expected to be in full bloom.

THE STANWICK NECTARINE.

MR. J. C. STEVENS will Sell by Auction, from 50 to 60 fine Plants, in pots, of this valuable Fruit Tree, on TUESDAY, July 1, at his Great Room, 38, King-street, Covent-garden, on account of the Fund forming by his Grace the Duke of Northumberland, in aid of the Gardeners' Benevolent Institution —Catalogues of Mr. J. C. Stevens, 38, King-street, Covent-garden, London.

# The Gardeners' Chronicle.

*SATURDAY, JUNE* 28, 1851.

MEETINGS FOR THE ENSUING WEEK.

| | | | |
|---|---|---|---|
| Tuesday, | July | 1—Horticultural | 3 P.M. |
| Wednesday, | — | 2—Royal Botanic Gardens | 2 P.M. |
| Thursday, | — | 3—Zoological | 3 P.M. |
| Friday, | — | 4—Botanical | 8 P.M. |
| Saturday, | — | 5—Asiatic | 2 P.M. |

Country Shows.—Tuesday, July 1: Oxford Horticultural.—Thursday, July 3: Highbury and North London Horticultural, and Ipswich Horticultural.—Saturday, July 5: North Kent Horticultural.

On several occasions we have ventured to suggest to the owners of stationary steam engines that they might, with advantage to themselves and the public, economise the heat belonging to their waste water, by applying it to horticultural purposes. Manufacturing towns were more especially pointed at as places where this kind of economy might have a large application.

We particularly referred to some important experiments of Mr. Dillwyn Llewellyn, of Penllergare, which we think it desirable to reproduce. From a small 8-inch cylinder engine, employed by him for agricultural purposes, this gentleman conducted a jet of steam for twenty minutes daily, through an inch iron pipe, into a bed of rough stones, covered by a glazed frame. A journal of the temperature was kept for 11 days, with the following result:

Statement of Experiment with Waste Steam, as a medium of Bottom-heat, made at Penllergare, 1850.

| Date. | Time of Observat | Thermometer. | |
|---|---|---|---|
| April. | | Degrees. | |
| 9... | 12 Noon..... | 51 | Steam introduced about 12 [o'clock. |
| ,, ... | 5 P.M. ..... | 54 | |
| ,, ... | 7 P.M. ..... | 56 | |
| 10... | 12 Noon ..... | 68 | Steam introduced. |
| ,, ... | 3 P.M. ..... | 73 | |
| ,, ... | 5 P.M. ..... | 85 | |
| ,, ... | 7 P.M. ..... | 96 | |
| 11... | 7 A.M. ..... | 108 | Steam not introduced. |
| ,, ... | 12 Noon..... . | 104 | |
| ,, ... | 5 P.M. ..... | 98 | |
| 12... | 10 A.M. ..... | 83 | Steam not introduced. |
| ,, ... | 7 P.M. ..... | 79 | |
| 13... | 10 A.M. ..... | 69 | Steam introduced. |
| ,, ... | 6 P.M. ..... | 75 | |
| 14... | 10 A.M. ..... | 82 | Steam not put on. |
| ,, ... | 7 P.M. ..... | 79 | |
| 15... | 10 A.M. ..... | 70 | Steam introduced. |
| ,, ... | 6 P.M. ..... | 73 | |
| 16... | 10 A.M. ..... | 81 | Steam introduced. |
| 17... | 10 A.M. ..... | 76 | Steam introduced. |
| ,, ... | 4 P.M. ..... | 79 | |
| 18... | 10 A.M. ..... | 94 | Steam introduced. |
| ,, ... | 5 P.M. ..... | 110 | |
| 19... | 10 A.M. ..... | 108 | Steam not introduced. |
| | 6 P.M. ..... .. | 96 | |

From this it appears, 1st, that although steam was introduced among the stones for only 20 minutes a day, the temperature was raised from 51° to 68° in the first 24 hours; 2d, that the temperature continued to rise for many hours after the second application of steam, until the thermometer reached 108°; 3d, that, at the end of 19 hours, the heat of the frame diminished; yet 4th, that at the end of *seventy hours*, the temperature still was 69°. This appears a conclusive answer to those who think that masses of heated water, or heated porous materials, like rough stones, will become so reduced in temperature by a few hours' withdrawal of the prime heating power, as to endanger the plants cultivated in houses thus warmed.

Our learned "practical" friends thought that we were poking fun at them, shook their sagacious heads, and pronounced the scheme an idea worthy of the editor of the *Gardeners' Chronicle*, and, we suppose, of nobody else. We have, therefore, for their especial comfort, the pleasure of announcing that the experiment has been attended by continued and perfect success, that Pine Apples grown in this way have actually fruited, that the fruit has actually ripened, that fine clear-skinned, evenly-swelled Queens, with a barrel like a hand-organ, have been produced, and that the said fruit was of so fine a quality, so fragrant, so rich, so everything that a Queen should be, as to have excited the private admiration of the fastidious jury, No. III., now sitting in judgment upon the eatables, drinkables, and smokables, submitted to their Rhadamanthine opinion in the Crystal Palace.

Thus it appears that a Pine Apple climate may be formed in Great Britain, without the cost of a farthing for heat, and that a West Indian sun may be had for nothing.

---

Plants play a very important part in the economy of the creation; for, independent of their relation to animals as the real source of all food, they are essential to the purity of the air. We are told by chemists, that the composition of the atmosphere is quite constant and uniform; that air, from whatever place it is collected, is always found to consist of the same proportions of oxygen and nitrogen and carbonic acid. This fact has now been established by a number of careful experiments, made by different observers, in various parts of the globe, and extending over a considerable period of time, so that it may in fact be considered as proved, not only that the composition of the air is uniform throughout, but also that it does not undergo any appreciable variation in nature from year to year. There is certainly something very wonderful in this, and indeed it seems difficult to understand how it really can be the case, when we observe the great chemical changes which are at all times going on in the atmosphere, and the enormous quantities of certain substances which are constantly being poured into it in various ways. Night and day all living animals are consuming the oxygen of the air, converting it into carbonic acid, and the same effect is also constantly being produced all over the earth, by fires, furnaces, lamps, candles, and in short by combustion in all its forms. Decay, putrefaction, and fermentation, are also giving rise to the evolution of carbonic acid; and lastly, besides all these sources, immense quantities of the gas in question are evolved from fissures in the earth, especially in what are termed volcanic districts. There are then, to say nothing of smaller or more local causes, at least half a dozen great natural operations, all tending to vitiate the air, diminishing the quantity of oxygen which it contains, and increasing the proportion of carbonic acid. All these causes, we are told, are exactly balanced and neutralised by the decomposing influence of plants, and the wonderful power which they have of absorbing the carbon of carbonic acid. We owe this remarkable fact to the researches of Drs. Priestley and Ingenhousz, extended, repeated, and confirmed by a host of other observers.

In Dr. Priestley's first experiments on carbonic acid or fixed air, it is evident that he regarded it as highly poisonous to plants; for in the first volume of his very interesting Essays on Air, he says,—"Fixed air is presently fatal to vegetable life;" and he then goes on to show that plants, in many cases, were very soon killed, when exposed to the influence of carbonic acid gas, collected from the fermenting vat of a brewery; he however observes, that he did not repeat the experiment with pure carbonic acid artificially prepared, and regrets that he had not yet had leisure to do so. These experiments were repeated and extended by his friend Dr. Percival, who published an account of his results in Hunter's "Surgical Essays." The conclusion to which he arrived, was just the contrary of what might have been expected from Dr. Priestley's experiments; for he states, "that fixed air not only retards decay, but actually continues the vegetation of plants, and affords them a pabulum, which is adequate to the support of life and vigour in them for a considerable length of time." So satisfied was he of the truth of this, and the important influence that the discovery would have upon the art of gardening, that he goes on to point out how the florist who is anxious to obtain a prize at some great meeting held for the encouragement of horticulture, might perhaps avail himself of the powers of "fixed air," either to quicken the growth of his plant if still immature, or to preserve it in all its beauty, and retard its decay if fully developed; and he accordingly gives several directions to gardeners who are willing to try the effect of carbonic acid gas on their flowers. Some years before this time, however, Dr. Priestley had observed that plants grew well in air which had been vitiated by the breathing of animals, and that they soon restored such air to its original state of purity; it seems that he did not at that time very distinctly connect the two phenomena together, for it was not till after Dr. Percival's experiments had been published, and after Ingenhousz had promulgated his views upon the subject, that carbonic acid began to be regarded as essential to the growth of plants. It is not easy now, neither in fact is it very important, to decide exactly what degree of merit belongs to each of these three philosophers. The experiments of Ingenhousz were the most numerous and minute, and his views were the most strongly criticised by contemporary naturalists; at the same time he distinctly states that his experiments arose out of those of Dr. Priestley.

The circumstance which prevented many observers from believing in the importance of carbonic acid to plants, arose from the fact, that as in nature they are only supplied with it very gradually and in small quantities, and as their organs are only fitted to absorb it when largely diluted with common air, so, when placed in an atmosphere containing a considerable proportion of this gas, they are always more or less injured; and it was difficult to understand how, if carbonic acid in small quantities was food and nourishment, that in rather larger quantities it would be hurtful and even poisonous.

Dr. Percival's idea of the probable value of carbonic acid as a powerful agent in the hands of the skilful gardener, is one which naturally leads to several interesting considerations, and it has accordingly produced a number of curious experiments, which, though they certainly do not justify his prediction, or, indeed, give much prospect of any really important direct improvement in practical gardening, are nevertheless very curious and interesting. The primary question of course is, are plants always able to absorb as much carbonic acid from the air as they require, and would benefit be derived by increasing the proportion of it, in the air of a forcing-house for example? When Dr. Priestley found that pure carbonic acid was hurtful to plants, he next tried mixtures of it with common air, and he found that even one-eighth of it rendered the air poisonous. Ingenhousz, after a great number of experiments, and, though quite satisfied that plants really decompose carbonic acid, speaks with great doubt of the effects which it produces when artificially added to the air. He says, "plants grow tolerably well in air to which a small quantity of carbonic acid has been added, especially if they are exposed to the sunshine; sometimes even they seemed to grow all the better for it," but he adds, "that it is doubtful if this effect was really due to the presence of the carbonic acid." A second, and very remarkable series of experiments is described by De Saussure, the result of which showed that the addition of carbonic acid, where more than a tenth was added, always did harm, whilst a twelfth produced a decidedly beneficial effect, if the plants were exposed at the same time to the influence of light; there are however, unfortunately, several interfering causes in these experiments, which Saussure overlooked, and which diminish their real value. Three years since, some valuable observations on this subject were made by Dr. Daubeny, who conducted a careful series of experiments, with the object of ascertaining what proportion of carbonic acid in the air healthy plants are able to endure, without inconvenience. The result of his investigations prove, that 10 per cent. of carbonic acid is not at all injurious to plants, and that it is some time before even rather larger proportions of that gas begin to produce bad effects. Even as much as 20 per cent. produced no injury in 10 days.

In all considerations of this sort, it is obviously the best way to commence by studying the natural conditions of plants, before we begin to place them in new and unnatural circumstances. In nature, plants are supplied with an almost infinitely small quantity of carbonic acid, and the effect of their growth is to deprive the air which surrounds them of that carbonic acid, and to replace it by an equal volume of oxygen.

The chief difficulty which exists in comprehending the true bearings of this great fact, depends on the enormous magnitude of the entire atmosphere, and the almost infinitely large quantities which we have to consider. It is easy to form some idea of the quantity of carbonic acid which is produced in a given time on a square mile of the earth's surface, and which the plants growing on it consequently may be supposed to have to decompose in the same period. But it is very difficult to form any just idea of the whole atmosphere, or to comprehend the relation which exists between the bulk of the carbonic acid and that of the entire atmosphere. Large as the former appears to us, and enormous as its quantity is, when compared to the largest tree,

yet it is a mere trifle, a thing of very little account, when contrasted with the bulk of the whole atmosphere.

If, for example, we assume, for the mere purpose of comparison, that on an average each human being on the surface of the earth gives out, in the course of twenty-four hours, twenty-four ounces of carbonic acid gas, a proportion probably not very far from the truth, the volume of the gas thus expired would be about twelve and a half cubic feet; and the entire quantity given out during a whole year at this rate, would be 4744 cubic feet of carbonic acid gas; having a weight of about 547 lbs., very nearly a quarter of a ton! If then we go a little further, and calculate what would be the bulk and weight of the quantity of carbonic acid that would be given out by the entire population of the globe, during a whole year, assuming its number to be 600 millions, and supposing that every individual required the same quantity of carbonic acid, we should then arrive at the result of very nearly three million of millions of cubic feet, or 316,266 million cubic yards of carbonic acid. This quantity is so large that it is difficult to conceive any just idea of its real volume, and the consideration is not rendered much simpler, if we reduce it into cubic miles; we then find that it would amount to about 58 cubic miles. On the other hand, if we calculate the weight of such a quantity of carbonic acid, we are nearly as much bewildered with high numbers, for we find that it amounts to 326,200 million pounds, or 145 million tons! and this, be it remembered, is but a very small portion of the carbonic acid which plants must absorb every year.

## ORCHIDS FOR THE MILLION.—No. VI.

(By B. S. WILLIAMS, gr. to C. B. WARNER, Esq., Hoddesdon.)

TREATMENT DURING THE TIME OF REST.—Rest is of great importance to Orchids, as well as other things. No plant will continue long in good health without it. My practice is to give them a long season of rest, generally from November to the middle of February. During this time the temperature of the East India house should be regulated so as to keep it as near as possible at 60° by night, and 65° by day; but by sun heat the temperature will rise a few degrees higher. Air must then be given so as to keep it about 65°; but a few degrees of solar warmth above this point will do no harm. A little air should be given on every fine day, in order to dry up damp; but the air must be admitted close to the hot-water pipes, so that it may become warm on entering the house. As to those plants that come from the hotter parts of India, the temperature should not be allowed to go below 60°. The Mexican house should range from 50° to 55° by night, and from 55° to 60° by day; this should not be allowed to go below 50° at night.

Rest is induced by lowering the temperature and withholding water from the plants; during this season they should only receive sufficient water to keep them from shrivelling. There are, however, some plants that will grow during the winter months, as many of the Aerides, Vandas, Saccolabiums, Phalænopsis, Zygopetalums and similar kinds. These will require water at the roots to keep them increasing, but be careful not to wet the young roots, for if they get wet they are very apt to rot at this season of the year. Those that are growing should be placed at the warmest end of the house.

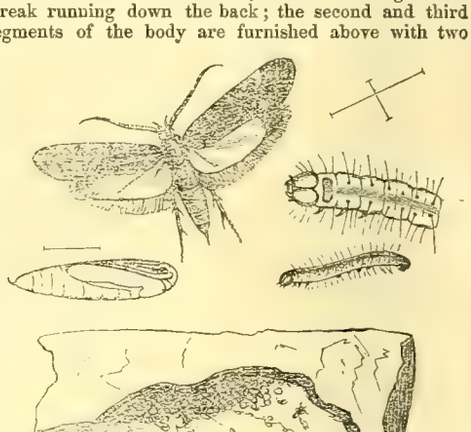
Some Orchids are deciduous, losing their leaves after they have finished their growth. To this class belong Cyrtopodiums, Barkerias, Cycnoches, Phaius albus, some of the Dendrobiums, Cœlogyne maculata, C. Wallichiana, and many others. I always place these so that they may have as much light and sun during their season of rest as possible. This s the only way to ripen their bulbs, which causes them to grow stronger and flower more freely. These plants require but very little water when at rest. But when such plants as Vandas, Angræcums, Aerides, Saccolabiums, and Phalænopsis are at rest, they should never be allowed to get too dry at the roots, always keeping the moss a little damp; for the bulbs and leaves are very apt to shrivel if kept too dry, and this often causes them to lose their bottom leaves. The stems and leaves of such plants should be kept plunged, and they require but a short season of rest; those which are growing on blocks will require more water than those which are in pots or baskets, and they should be watered about twice or three times a week if the weather be fine, but in dull weather they will not require it so often. The water should be poured over the paths and walks every fine morning, with a view to create a moist atmosphere, but the moisture in the house must be regulated according to the weather outside—this is an important point to be attended to; if the weather is dull outside, the house, inside, must be kept dry. The glass and roof should always be perfectly clean, so that the plants can have plenty of light and sun; it is my practice, as soon as the season of rest commences, to wash every piece of glass on the house, and also the woodwork.

INSECTS.—The plants are liable to be injured by many sorts of insects, such as red spider, thrips, mealy bug, white and brown scale, woodlice, cockroaches, and the small shell snail. The cockroach is one of the greatest plagues we have to deal with; they will do a great deal of mischief in a few nights, if they are not sought after, on every opportunity. The food they like best is the young tender roots and flower stems. I have seen the roots of a plant completely eaten off in one night. The only way to keep these insects under, is constantly looking after them, both by night and day. I search for them every evening by candle-light, and in the daytime by moving the pots and baskets under which they harbour. They leave their hiding places in the evening, and seek after food, and it is then that they are most easily caught. It is also a good plan to lay some damp Moss in the hottest part of the house; I have killed many in this way, looking the Moss over every two or three days. I have also destroyed them with a mixture of honey, lard, and arsenic, the latter in very small quantity. I place some of this in oyster shells in different parts of the house. Some growers mix the arsenic with tallow put on a stick which is stuck in the pots; care however must be taken that the mixture does not touch the leaves or bulbs of the plants.

The woodlouse and the small shell snail are also very destructive. These, like the cockroach, are very fond of the young roots; they may be trapped by cutting some Potatoes in two, scooping out the inside, and placing them on the pots and baskets, looking over them every night and morning till you clear your house of these visitors. Turnips cut in slices will answer the same end. Toads are very useful in catching insects; I always keep a stock of them in the house.

The best way of getting rid of red spider and thrips is constantly washing the leaves with clean water, and by fumigating the house with tobacco. My method is to fill the house with tobacco smoke three or four times; this should be done every two or three days till the insects are quite destroyed. Evening is the best time to do this. It is also a good plan to mix some lime and sulphur together, and rub it on the pipes in different parts of the house, but be careful not to use too much, and it should be used only when the pipes are warm. There should be a good supply of moisture at the same time, but not too much heat. The green fly, which makes its appearance in spring on the young flower buds, may also be destroyed by tobacco smoke.

The brown and white scale and mealy bug I keep under by constantly sponging the leaves and bulbs with water; the white scale is very troublesome if not looked after. Cattleyas are very subject to this; the following recipe for destroying these insects was given me by Mr. Veitch of Exeter, who is a very successful grower of Orchids, viz, to one gallon of rain water, add 8 ozs. of soft soap, one oz. of tobacco, and three tablespoonfuls of turpentine; stir well together, and leave the mixture for 48 hours; then strain it through a cloth; what you have to spare must be bottled off. It is necessary to rub the plants over two or three times, if they are much infested, but once will be sufficient in most cases.



## ENTOMOLOGY.

### THE YELLOW UNDER WINGED BARK MOTH.

ONE of the prettiest of our small British moths is to be met with rather abundantly in gardens in the end of May and beginning of June, flitting about with an unsteady kind of flight, and often to be seen on the wing during the day-time. It is the Tinea (Œcophora) sulphurella of Fabricius (by whom the female was considered as a separate species, under the name of Tinea flavella and cornutella), and is figured by Hubner in his great work upon the European Lepidoptera, under the name of orbonella, in allusion to its being a miniature resemblance to the Noctua (Triphœna) orbona. It measures about two-thirds of an inch in the expansion of its fore wings, which, as well as the body, are of a purplish black colour. The sides of the head and the palpi are ochre-coloured, the antennæ black, with a band of white along the middle, the thorax blue-black, with an ochre stripe on each side. The fore wings (which, in the female, are tinged with deep dull blue) are marked with two longitudinal streaks of fulvous scales, extending from the base to about the middle of the wing (which are less distinct in the male than in the female). There is also a large triangular fulvous patch on the inner margin near the extremity, nearly opposite to which, on the costal margin, is another fulvous patch, which is scarcely distinct in the males. The under-wings are fulvous yellow, with the costal margin, the extremity, and the fringe blackish. The accompanying figure represents a female moth magnified, the cross lines indicating the natural size; together with the caterpillar of the natural size, and with the fore segments of the body magnified; the chrysalis magnified, and a piece of Currant stem showing the wound formed by the caterpillar.

The genus to which this species belongs is distinguished from the other Yponomeutidæ by having the palpi longer than the head, and recurved, with the terminal joint very slender and naked, the antennæ of moderate length, with the base short, very pilose beneath as far as the middle, beyond which they have a pale coloured ring; the fore wings are much deflexed at the sides of the body when at rest, being long and rather narrow. The genus comprises another elegant British species, namely, the Œcophora Oliviella, which is not uncommon on palings and in hedges in June and July, flying about in the sunshine in the morning.

Œcophora sulphurella possesses considerable interest for the gardener, on account of its habits in the caterpillar state, during which period it resides beneath the bark of trees, the female depositing her eggs in slight fissures or wounds in the bark, which are then greatly extended in size, by the burrowing habits of the larvæ. Fabricius says that it inhabits old Oak wood, and that the larva state continues for three years. It is upon the inner bark and soft outer layer of the wood that the caterpillar feeds, boring only to a very little depth in the old wood, and forming for itself a web as a covering in its burrow, which is filled with excrement and bits of gnawed wood. I have found it especially numerous under the bark of Elder trees, as well as under the bark of old Currant stumps, which it sometimes burrows to such an extent as to destroy large branches of the tree, by eating away the inner bark all round the stem, whereby the current of the sap is entirely destroyed. I also received specimens, evidently of this larva, from "Este," at the end of April, 1850, which he found burrowing beneath the bark of a Downton Pippin. The caterpillar is rather long and thin, of a dirty yellowish grey colour, and the head orange or Chestnut coloured, the first segment of the body pale in front but brown behind, a darker longitudinal streak running down the back; the second and third segments of the body are furnished above with two

small shining dots, and the fourth and following segments have two pairs of similar dots, besides lateral ones—all these little dots emitting slender, bristle-like hairs; the jaws are powerful, but not porrected; each of the three anterior segments of the body is furnished with a pair of jointed legs, the sixth and three following segments have a pair of fleshy prolegs attached to each, and there is a pair of similar legs at the extremity of the body, the upper side of the last segment being dark-coloured and rounded. The larva moves very quickly, and, when alarmed, wriggles itself about, backwards, sideways, and in all directions, with great agility, throwing itself down from the stem, taking care, however, to secure its reascent by a thread from its mouth, so that it falls with its body in a perpendicular direction, the head being upwards. Its situation beneath the bark is generally to be perceived, owing to the mass of small black pellets of excrement with which the wound in the tree is thickly covered. In the month of January, I found these caterpillars of very different sizes; the smaller specimens were nearly white, whilst others had already assumed the chrysalis state, each being enclosed in a slender silken cocoon, the outside of which was covered with little pellets of excrement, and particles of rotten wood.

The chrysalis is rather more than a quarter of an inch in length. It is of a chesnut colour, and of an elongate oval form, with the extremity of the body conical. Unlike most subcortical chrysalids, it is not furnished with transverse rows of reflexed hooklets, across the segments of its abdomen, enabling it to move about in its case; the only analogous appendage which this insect possesses being a curved slender horny point at the extremity of the body. From its position, it is doubtless of much service, from the flexibility of the abdominal segments, in retaining itself in such position as may be necessary for its development. *J. O. W.*

## BRITISH SONG BIRDS.

(CAGE BIRDS, No. 19.)*

No. XXXV.—When I first commenced dilating (contrary to my original intention) on the habits of the nightingale, I was fearful lest my extended observations from week to week might prove tedious. Each successive day, however, brings with it such pleasing, such abundant proof to the contrary, that I have thrown all my best energies into the subject. It is indeed, as most of my correspondents remark, no less singular than true, that there is really no valuable *practical* work on British Song Birds existing; and I can well understand why, under such circumstances, I am urged to be "explicit." Let me hope that my intimate acquaintance (some 30 years) with the feathered tribe, will at last furnish the required desideratum. Thus much, parenthetical.—If ever your nightingales droop, or show an unusual want of liveliness, which in the autumn they very often do, change their food a little. They are particularly fond of ants' eggs, and liver gentles. Give them occasionally a few of each; and never pass them without taking some notice of them. They cannot bear a slight. On every occasion of kindness shown, *you* will be the gainer.

* A number of "anxious enquirer" will be gratified to learn, that their favourite bird, "The BLACKCAP," will be introduced in Cage Birds No. 22, to appear July 19.

I need hardly remark that nightingales never "breed," when in confinement. So contrary would such a thing be to their nature, that I apprehend no authenticated instance of their having done so is on record. When this is the case, I think we cannot err in saying,—that keeping birds which were born "free," under such circumstances, *must be* cruel. They rather exist than live with us. Their hearts are far,—far away.

I have before casually noted (whilst treating on SEED birds) that soft-billed birds when performing any call of Nature, always bolt their tails, and this action proves them to be in health—whereas the very converse is the case with *seed* birds. This makes it needful to attend to proper diet. If the nightingale were *not* to bolt his tail on certain occasions, it would be an unerring symptom of illness; and a meal-worm or two should be given him immediately. If he refuses *these*, he must be bad indeed!

Sometimes, in the heat of summer—indeed oftentimes, if not regularly looked to—the cages of these birds emit a very offensive smell. This, as I before remarked, arises from the nature of the food they eat. Let me, therefore, again urgently recommend extreme cleanliness. The bird can then respire freely, and enjoy himself; and he stands a fair chance of keeping in good health. One-half of our birds and domestic animals have their lives shortened, and their health injured, by neglect.

As a rule, I should say never keep a nightingale, unless a brancher, or a nestling, more than three years. About this time, oftentimes sooner, you will observe their legs to swell, and to become gouty. Large scales will form, from the upper joint downwards, causing your birds so much pain, that they will frequently perch upon one leg only,—the other being drawn up for relief. I *have* succeeded in reducing these scales; but as it is difficult, and attended by danger, I shall give no "instructions." Let us therefore charitably consider that the time is now come to reward our little friend, for the pleasure he has afforded us. We have unmistakeable signs that confinement has brought on premature old age. The only remedy for this—the only way to regenerate his system—is, to let him fly. This should be done in the month of July or August, just before he moults. He will then have time to recruit himself before taking his final leave in September, and acquire renewed strength to waft him across the Mediterranean.

How long these birds live in a state of freedom, I am not quite prepared to say,—it is supposed about 12 years. This much, however, is certain—the very same bird you liberated will speedily be restored to health, and to youth. The chances, too, are, that he will return to your garden the very next season, and there abide,—until having reared a family, he again revisits his former haunts. These are notorious "facts." Far be it from the nightingale easily to forget the rights of hospitality. You have fostered him, and given him liberty, and he will annually reward you with songs of gratitude as long as he lives, and you live to hear him.

Nightingales, if affectionately tended, moult freely in a cage, and get through their troubles in a very few weeks. They should be kept warm, and quiet, but not covered up too close. It is desirable to keep their food varied, and to treat them now and then to a few ants' eggs, raw scraped Carrot, or a meal-worm. Do anything but neglect them. *This* would cause their sensitive hearts to break. They are not fashioned like ours!

Do not feel surprised if, at the "fall of the year," your birds show unusual excitement, and dash about their cages. They *will* do so. The same will occur at the spring of the year. It is called "agitation," and is peculiar to all "birds of passage." This is so interesting a subject, that it will form matter for discussion in a separate chapter, hereafter. Nature's laws are truly wonderful! Let me, however, remark that although the birds' plumage may suffer from this agitation, they will regain their self-possession, and their usual flow of spirits, in about three weeks. Still you will observe *occasional* signs of melancholy throughout the autumn.

Birds caught immediately on their arrival in England, are of little value the first year. Their song seldom lasts, in a cage, more than three weeks. When, however, use, which is said to be second Nature, reconciles them to their master or mistress, they show great gradual improvement. They break out into song either at Christmas, or early in the following year, and continue in fine song until June. They are then silent until October; when they "settle down" with the family in a nice snug room, warmed by a bright cheerful fire, and gaily lighted for the happy enjoyment of a merry round party. *Then* will the mellifluous jug-jug, the soul-enchanting water-bubble, and the thrilling love-chant, be heard throughout the house. *Then* will the inherent excellences of our noble hero be universally acknowledged. *Then* are our household-gods "complete."

It is perhaps not so well known as it ought to be, though I have already hinted at it, that the nightingale, when in confinement, is a most cruelly-jealous bird,—jealous not only of his master or mistress noticing any other bird than himself,—but jealous of his own tribe. His motto is,—*Aut Cæsar, aut nullus*. He will admit no rival near the throne. Hence, to keep two of these birds in one room would be ridiculous.

The same extraordinary failing prevails in most of our "warblers." If out-done in song, they frequently fall "dead," from off their perches. Some of these rival musicians, be it known, do not weigh a quarter of an ounce! When, therefore, it is considered desirable to keep several nightingales, let each occupy a separate apartment. By this precaution, not any one of the birds will be put down or silenced, and each will sing without having his temper ruffled. It is sometimes a hard matter to restore the serenity of one of these "enraged musicians." Even then, his rage smoulders!

When autumn visits us, and there is a sudden change of temperature, be sure and keep your birds in a warm, cheerful room. Never leave them by any chance, in a room without a fire. They are very sensitive, and soon fall sick. Extreme cold inflicts blindness on them, and they cannot see to find their food. Their finely-constructed lungs require to be studied in the minutest particular. Never therefore let them remain in a smoky room; and let them be always removed *pro tem.*, when your Abigails have a "domestic rout;" also when there is a general sweeping of carpets. Attend to these little matters, and you will be rewarded to your heart's content. *Wm. Kidd, New-road, Hammersmith.**

## Home Correspondence.

*Rot in Larch.*—My opinion as to the cause of Larch rot is quite different from yours. Of course all land to be planted ought to be well drained, but I am not aware that this is more necessary for Larch than for other timber trees. I have cut down unsound Larch on land which I know was dry. I have had sound Larch growing on land that would hardly bear my weight, and I have seen unsound on like land. I believe that there are two conditions essential to the growth of sound Larch. The first and principal one is, that the Larch should never be planted mixed with Scotch Firs, or on land that has previously borne a crop of Larch, Scotch, or any other kind of Fir. Second, that it should have, at all stages of its growth, the free and healthy use of all its branches; or, in other words, that it should be planted thin, kept thin, and never pruned, except it is absolutely necessary in order to prevent dead knots. In this opinion I think I am confirmed by Loudon's "Arboretum et Fruticetum Britannicum," where this subject is largely discussed, and also by certain passages in Mr. Brown's work. *J. H., Liverpool.*——Your observations on the rot in Larch trees coincide generally with my own experience; namely, that it is commonly caused by too much water about the roots in winter. Every tree growing naturally in a suitable soil and climate secretes certain peculiar gums and resins of an antiseptic character, which glue together the fibres of which the annular layers are chiefly composed—hardening in time and amalgamating with them. These secretions are sufficient to preserve the tree from premature decay; but when a mountain tree is planted in a swamp, or one from a hot and dry climate is removed to a situation cold and wet; those conservative principles are not sufficiently elaborated to enable the tissue to withstand the undermining agency of the air, water, and inclement weather, of which probably water is the most injurious; soddening the roots during their period of rest, and in time dissolving that conservative cement which had been previously stored up. This dissolution I have always found to commence at the root; and then fine interstices are left between the concentric layers, into which, as you observe, a white mycelium penetrates, and no doubt expedites the disintegration of the tissue. What this mycelium is, it may be difficult to decide, but it is reasonable to suppose that it belongs to one of those species of fungus to which the tree is most commonly subject. The species usually found on the Larch is "Thelephora sanguinolenta," Eng. Flora, vol. 5; and the Mycelium beneath it bears a general resemblance to that found in the decaying trees; this, however, cannot be much relied upon, that of many species being nearly alike. It appears that old Larch trees are also subject to other species of fungi in their natural habitats. W. Turner, the famous physician and herbalist in Queen Elizabeth's reign, speaks of "the moste precious Agarick" found upon them in Italy and Norway, which was "soulde very dere in Italy, France, Germany, and England." This was probably "Dædalea sepiaria," Eng. Flora—"Agaricus boletiformis," Sowerby; but it does not grow I believe in this country, except on foreign timber. It should be observed, however, that the Larch is not a solitary instance of the particular state of decline to which you have called the attention of your correspondents. The Birch tree frequently fails under similar circumstances. I have examined trunks, in which all tenacity between the concentric layers was lost, so that they might be separated very easily; and a white mycelium occupied the interstices. This was succeeded by a small sessile Polyphorus, with a buff pileus and greyish hymenium, which I do not find described by authors—and by "Dædalea betulina." As to the exceptional cases to which you advert, I have myself seen not a few trees, which, I believe, were absolutely starved on dry heaths, for want of water enough; and it is not unusual to see large trees die where deep drainage has deprived them of their due supply. I think it very probable that most plants contain, while living, the spores of those fungi which prey upon them in decay; but that they have not the power to act upon those conservative substances which they contain when perfectly organised. If, however, these secretions are dissolved, the spores soon vegetate and penetrate the softened mass, with their creeping mycelium, to a great extent, without being able at all times to reach the surface and fructify. I have examined Oak staves which might be snapped easily between the thumb and finger, from lying in a damp place; yet these did not contain a trace of spawn; in others, however, the white filaments were running up the vertical tubes—the wood then affording their proper pabulum. This is commonly called "dry rot," but I do not think it invariably belongs to that much-dreaded species—the Oak being subject to several others, even more common—one of them "Fistulina hepatica" amongst the most beautiful of the order. *F. J. Graham, Cranford.*

*A Standard Weight for Pine-apples at the Chiswick Exhibitions.*—As Providence Pines have been produced weighing 14 lbs.; Enviles, 8 lbs.; and Queens the same; would it not be advisable that some standard be named by the Horticultural Society as to what the different kinds of Pines must reach in weight to be considered worthy of merit by the judges? Something like the following might answer:—No Providence Pine to be deemed eligible under 7 lbs.; no Enville, under 5½ lbs.; no Queen, under 5 lbs.; no Black Antigua, under 4 lbs.; no Otaheite, under 4 lbs.; and no Black Jamaica, under 2 lbs. I perceive that the Society's medals have been given for Providence and Queen Pines, in May and June, of very small sizes. *C. Bundy, Wadley-house, Berks.*

*Song Birds.*—It is stated, at page 392, that "the stonechat is a tender summer warbler." This is entirely erroneous. The stonechat (Saxicola rubicola) remains with us the whole year, and braves the severest cold upon open furzy commons, and only leaves these places when a fall of snow prevents it from obtaining food: it then seeks the marshes near the coast, where it may often be seen in considerable numbers. The whinchat (Saxicola rubetia) is migratory, and seems unable to bear much cold; but I kept both species in cages in perfect health for several years upon the plan recommended by the late Mr. Sweet; indeed, all the warblers may be easily kept in this way, and a supply of the maggots of the common flesh fly may be preserved through the winter in pots of earth, and upon these the birds will greedily feed. I may also observe that there is some confusion about the reed sparrow—the note of the sedge warbler being apparently described as belonging to this bird. The call-note of the reed sparrow is a simple squalk, and its song, if song it can be called, consists of only two notes, the first being repeated twice, and may be represented by the words "cheep-cheep, chee;" it is more monotonous than that of the yellow-hammer. The bird alluded to as found in Wales is undoubtedly the common redstart. *Henry Doubleday, Epping.*

*Forcing Peaches.*—In the Number for February 22, of this year, is an article on this subject by "J. M.," in which it is asserted that, when the fruit begins to stone, and till its completion, "the syringe and watering-pot must be sparingly used, or the fruit will drop off." I am aware that this is a maxim handed down to us by our forefathers; but have the growers of the present day investigated the matter? If moisture is the prime mover of the evil, in what way does it act to cause the fruit to drop? Perhaps "J. M." will oblige by giving his opinion on the subject, probably having experienced the effect, and made some observations on the cause. *Curiosus.* [Did "J. M." ever try the effect of warm water, say at 70°?]

*Drying Plants.*—If your correspondent "Botanicus" would take his plants out of the paper they had been partially dried in, that is to say, after two or three days, and the most tender and delicate plants after about 24 hours, and placing them in dry paper (a couple of quires under and one sheet over), proceed to iron them with a common smoothing iron, moderately hot, he would find the colours preserved in a much greater degree than by the common method. I have a large collection made in Italy and the south of France, mostly dried in this manner, and many dried thus in 1835, are still perfect in their colours; even the common Broom (Cytisus scoparius), which usually turns black (both blossom and leaf), and the flower of the blue Campanula, which becomes white, perfectly retain their colour when dried in this manner. Care is required to have the iron sometimes less hot, and sometimes more so, according to the different sorts of plants to be acted on; but this must be learned by experience. This process of drying prevents the necessity of dipping plants, such as Heaths, which have a tendency to cast their leaves in the drying, into scalding water, or any other mixture, as the hot iron effectually destroys the vitality at once. It has been found useful to lay silver paper, dipped in a strong solution of alum, on the specimens. *J. R. G., near Dublin.* [The specimens accompanying this letter were well dried. The point to be observed in drying plants is to do it quickly at a moderate temperature; that is all.]

*Composition for Iron Hurdles.*—I have tried, more than once, Mr. Fleming's mixture of Stockholm and gas tars heated, on wood and iron fences, and have not succeeded with it. It was shortly washed off, and taking the cost of the materials, the iron barrow, and two men (a boy cannot move the barrow), it was expensive. I have, however, used for many years, and found it to succeed perfectly for wood, as well as iron work, a mineral gas tar, prepared by Messrs. Cassall, Mill-wall, Poplar, London, and sold in casks containing from 270 to 300 lbs., and costing about 12*s.* or 14*s.* each. *LL., Shrewsbury.*

*Yellow Roses at the Chiswick Exhibition.*—I would advise Messrs. Lane to keep more correct data of their grievances. In 1849 Messrs. Lane and Francis were awarded first and second prizes for 6 yellow Roses in pots! In 1850 the rules stated, that "pale cream colours were inadmissible;" on that ground we were both disqualified, and the prize was given to six cu

* Replies to a number of questions, asked of the Editor of the *Gardeners' Chronicle*, will be found among the "Notices to Correspondents."

yellow Roses. Why did Messrs. Lane not state their grievances then, when the prize was given to an amateur gentleman's gardener? The reason is obvious. Are Messrs. Lane quite correct as respects their list of yellows shown in 1849 and 1850? I think not. *E. P. Francis, Hertford.*

*Budding Plums and Cherries.*—Although quite successful in my budding and grafting of Apples, Pears, &c., I find that in Plums and Cherries it is far otherwise, and I frequently find that although the bark of the bud is alive in the spring following, yet the bud itself remains dormant, even when stimulated by the stock being headed down to a foot above the insertion; I sometimes fancy the scion too old and sometimes that it is too immature, for it seems to be equally uncertain whether I bud at the end of July or the middle of August; sometimes every bud takes, and those inserted a few days earlier or later not one. I also find that the same uncertainty prevails whether I leave the young wood adhering to the bark of the bud, or take it away before insertion; please to give me some advice on the subject. *T. G., Clitheroe.*

*Climate of Torquay.*—I remark in your paper of this day (June 21), which I have frequently done before, a communication from Torquay which, from the respectability of the writer, I have no doubt is true. I would wish, however, to correct the notion which of late it has been the fashion to inculcate, that the place alluded to (Torquay) is so peculiar for its mildness and those general recommendations which the south of Devon enjoys. Torquay is simply one of the little coves with which Torbay and the coast down to Salcombe abounds, in all of which the same genial climate prevails, and the same fruits, flowers, and vegetation luxuriate; and if you refer to the hand-book of Devon and Cornwall, you will there see that the whole of Torbay, bound on its south by Berry Head (not the quay called Torquay alone), possesses the charms of which all desire to partake. *South Devon, June* 21.

*Æsculus rubicunda.*—People talk of the purple Laburnum, which bears its threefold blossoms here and everywhere. But an Æsculus rubicunda in my garden yearly produces, upon one branch, spikes of pale yellow flowers, smaller in size, and somewhat similar in colour to those of the Æsculus or Pavia, called flava. I count seven yellow spikes on it this year. What is Æsculus rubicunda; a species or a hybrid? *A. H.* [We presume a hybrid.]

*Rhododendrons.*—Three or four plants of the true R. arboreum have this spring bloomed in the open ground at Combe Royal, after a growth of some years. The plants in question were raised from seed, imported from Nepaul by Messrs. Veitch, and were planted out of doors as an experiment. Though Combe Royal is situated in one of the mildest parts of Devonshire, a still warmer climate seems to be required by this magnificent shrub, as the young shoots are often injured by a spring frost, and the flower-buds also damaged. It is observable that many of the seedlings vary in size, form, and hue of their flowers, several being spotted, others of a uniform tint, while one has produced such a cluster of blossoms of glowing scarlet, which for size, texture, and waxy opaque colour (if I may use such a term) as few conservatory plants can boast. R. arboreum roseum, being of a more robust constitution, has flowered during the month of April, in the most luxuriant manner, while R. zeylanicum produced perfect heads of bloom in January. Is there any difficulty in growing the yellow and buff hybrid Rhododendrons, raised by Mr. Smith? and have they succeeded anywhere, in a satisfactory manner, in the open air? *A Devonian.*

*Country Shows.*—In 1844 a horticultural society was established in Airdrie for improving the science of gardening in the burgh and neighbourhood. The prizes offered were open to all competitors; but after three years' experience it was found that parties with small gardens could not compete with gentlemen's gardeners, and in 1847 the society was divided into first and second classes, class first being open to all competitors, class second open to amateurs only. A dispute has arisen among the members as to who ought to be considered amateurs. For instance, I cultivate a small piece of ground attached to my rented dwelling-house, not exceeding seven falls, others more or less; but the following is an example of what is complained of on the part of amateurs: Mr. C. W. has a large garden, walled and otherwise sheltered; he employs a gardener constantly from the beginning of March till the end of May, and afterwards at least three or four days in the week during the rest of the year. Mr. W. A. has a walled garden, containing upwards of an acre of ground, with two large Vineries and a greenhouse, besides a number of frames; his whole time is occupied in the cultivation of his garden, the productions of which he sells to the best advantage. Mr. J. A., governor of a certain institution in the locality, has upwards of an acre of ground attached to the institution, besides the garden allotted for himself; and although he works a good deal, yet the inmates, both male and female, do the heavy work. Your opinion as to whether these individuals with their large gardens, Vineries, greenhouses, frames, &c., ought to be allowed to compete with an individual or individuals who have not above seven falls of ground out of which to take their articles for competition, will oblige *A. W. A.* [This question can only be settled on the spot. Upon the face of the statement this writer seems to be a cottager, and should show as such.]

"*Orchids for the Million.*"—Although Mr. Williams' papers are very useful to cultivators of Orchids, yet there are some plants which are either specially difficult to cultivate, or specially difficult to grow so as to produce flowers. I believe nearly all find Epidendrum bicornutum difficult to grow under the ordinary treatment. I inspected a good specimen of Paphinia cristata, which flowered, but has since made little progress. Both of them have been potted in rough peat, and kept in a moderately warm part of the Orchidaceous-house. Burlingtonia rigida, treated in the same manner, rarely blossoms. Epidendrum rhizophorum is tied to a tall block, which is inserted in a pot, and kept in the cool house; and this, though it grows freely, produces no flowers, and I believe this is the case with most specimens of this plant. It is probable some of your correspondents may be more successful with the plants I have named, or may be able to suggest some mode of treatment different from that which I have mentioned. *Dodman.*

*Singular Apple-blossom.*—My attention was this week attracted by what appears to me to be a very singular blossom on an Apple tree growing in the orchard here. It is perfectly white, about 2½ inches in diameter, contains in its corolla 26 petals, regularly placed, and in every respect presents the appearance of a beautiful semi-double Camellia. The tree appears to be about 20 years of age. It is in good health, with a good crop of fruit fully set on it, and the other blossoms were of the ordinary form and colour. The soil on which it grows is rich, strong, and calcareous, resting on a deep, rich marl bed. Having never seen or heard of such "a sport" in an Apple tree before, may I beg to ask your fruit growing readers if such occurrences are common? If not, I would be disposed to have the young shoots which grow outside this blossom grafted next spring, in the hope of making permanent what strikes me would be a beautiful addition to our hardy flowering trees. I should, perhaps, state that I do not know what kind of Apple the tree bears, but I think it a rather early variety. *Edward Carroll, Beg Erin, Wexford, June 18th.* [We are not acquainted with any variety of the Apple answering to this description].

*Salting Walks.*—Some years since I made two or three experiments in killing weeds in walks by strewing salt upon them in the spring; but the weeds appeared thicker in the autumn, and required another dose with the same effect. On each occasion the walks had a slovenly appearance till the burnt weeds were got rid of. The expense was at least equal to that of hand-weeding, and I gave up the practice. Mr. Fleming's plan of applying salt and water may perhaps answer on a large scale, but I should fear that, taking into consideration the cost of the machinery and its application, it would hardly pay. *LL., Shrewsbury.*

*Hydropeltis.*—Is this plant, figured in Bot. Mag. 28, 1147, cultivated in our garden ponds? *A. H.* [We never saw it alive.]

*Rough Plate Glass.*—I observe that a few complaints have reached you respecting this glass; but I am of opinion that they are groundless. It is used in pits and frames here in quantity, and answers perfectly. Indeed, so much am I in favour of it, that I can confidently recommend its use for all gardening purposes. It is cheap and strong, and is on that account very suitable for pits and frames, whose lights, being frequently moved, are liable to be broken. It may not look so well in fine houses as other glass; but it does not burn, and that is a great advantage. Mr. Walford's Strawberries must have been scorched through his not giving them air enough. *D. Kidd, Garnstone Park.*——In consequence of the letter of "C. Walford, Esq.," which appeared on Saturday last, I have to-day waited upon him, to ascertain if his lights were really glazed with "Hartley's patent rough plate" or not. For the present, I take the liberty to send you a few of the leaves of the Strawberries, in order that you may see if they really are "scorched or baked." *Jas. Phillips,* 116, *Bishopsgate-street Without.* [These leaves are in wretched plight; but there is nothing to show that the injury is caused by scorching through glass.]

## Societies.

CALEDONIAN HORTICULTURAL, *June 5.*—Professor BALFOUR, V.P., in the chair. On this occasion there was a good display of plants and florists' flowers; but the weather being unfavourable in the early part of the day, the attendance of visitors was not so numerous as usual. Prizes were awarded as follows: For the best four Pansies, grown and exhibited in pots, to Mr. Mitchell, gr. to Lady Keith, the varieties being Aurora, Supreme, Mrs. Beck, and Duke of Norfolk. For twelve blooms, to Mr. Currie, gr. to Miss Wedderburn, for France Cycole, Climax, Duke of Norfolk, Sir Robert Peel, Queen of England, Polyphemus, Sambo, Supreme, Helen, Miss Wedderburn, Mrs. Beck, and Duchess of Rutland; 2d, Mr. King, for Cossack, Polyphemus, Supreme, Sambo, Aurora, Eliza, Satirist, France Cycole, Duke of Perth, Countess of Zetland, Mrs. Beck, and Lucy Neal; 3d, Mr. Shearer, gr. to the Marquis of Tweedale. Tulips: 1st, G. B. Simpson, Esq., for Herodus Superb, Surpasse Triomphe Royale, Cerise de Maroc, Bienfait (flamed), Nero, Washington, Bienfait (feathered), Calypso, Polyphemus, and Commandante de Berlin; 2d, Mr. Young, gr. to T. Oliver, Esq., for Louis XVI., Black Bouquet, Grand Duchess of Wellington, Grand Monarque, Athalia, Camuse de Craiz, Glory of Walworth, Helena, Caledonian Hero, Duc de Savoy, Commander-in-Chief, and Duke of Sussex. Pelargoniums: the Silver Medal was awarded as 1st prize to Mr. Cameron, gr. to S. Hay, Esq., for Forget-me-Not, Negress, Chaplet, and Tysiphone; 2d, Mr. Cossar, gr. to Lady Hay, for Lady Clare, Queen Anne, Centre of Attraction, an Diana; 3d, Mr. Crocket, gr., Raith, for Duke of Cornwall, Symmetry, Beauty of Clapham, and Forget-me-Not. White Stocks: 1st, Mr. Gordon, gr. to J. H. Mackenzie, Esq., Red Stocks: 1st, Mr. Dunn; Cinerarias: 1st, Mr. Henderson, gr. to C. K. Sivewright, Esq., for Carlotta Grisi, Climax, Vulcan, and three seedlings; Alpine Plants: 1st, Mr. Pender, gr., Moredun, for Euphorbia Cyparissias, Saxifraga pyramidalis, Erinus hispanicus, Pentstemon procera, Thalictrum alpinum, and Cheiranthus Marshallianus. There were six competitors for the prize offered for the heaviest 24 heads of Asparagus, fit for the table, with an account of the mode of culture. The best bundle (which was 7 inches in length and weighed 27 oz.), was from Mr. Carstairs, Warriston Lodge, but it contained only 23 heads, being one short of the specified number, and was disqualified: the second best, which was from Mr. Pousty, Ayton House, was also set aside, no account of the mode of culture having been sent. Early Turnips: 1st, Mr. Reid, gr., Edmonston, for White Dutch. Peas: 1st, three stems of Peas, with roots attached, Mr. Bryden, gr., Dun Edin, the variety being Early Frame. Cucumbers: 1st, Mr. Anderson, gr. to the Earl of Stair, for a brace of Infant Cucumbers. The prize of One Guinea, offered through the Society by Messrs. Dickson and Co., to practical gardeners, for the six finest varieties of Calceolaria, was awarded to Mr. Mitchell, Ravelston, for well flowered plants of Tam o' Shanter, Van Tromp, Ianthe, Aurora, Pearl, and Bass Rock. There was likewise a good display of productions sent for exhibition only, and not for competition. Messrs. Dickson and Co. sent the new Mitraria coccinea, Escallonia macrantha, many Heaths, and other plants of interest. Messrs. J. Dickson and Sons, Inverleith Nurseries, likewise sent Greenhouse Plants. Messrs. P. Lawson and Son exhibited Abies Deodara robusta and variegata, Taxodium distichum microphyllum, Quodria heterophylla, a new species of Isopogon from Swan River, &c. From Mr. Carstairs were Fuchsias, Fancy Pelargoniums, and several seedling Cinerarias; and from Mr. Stark, Saxifraga leucanthemifolia, Cinerarias Lady Hume Campbell and Madame Sontag, &c. The collection of Mr. Methven, Stanwell Lodge, included a plant of Cupressus funebris, nearly 2 feet in height, Cinerarias Lady Hume Campbell and Madame Sontag, and three hardy seedling Rhododendrons. Mr. Handasyde contributed a stand of Ghent Azaleas, Pansy blooms, and an interesting set of Alpines, including "Viola lutea," Ajuga genevensis, and Aquilegia Whitmaniana. Messrs. Sang and Sons sent a well-flowered Azalea lepida, 5 feet in height. There were stands of Roses, Pæonies, Rhododendrons, and choice Calceolarias from Messrs. Ballantyne and Sons; and a stand of Tulips from Mr. Lightbody. Various papers were read, and 12 new members elected.

ROYAL SOUTH LONDON FLORICULTURAL.—This Society held its third show for the season on Wednesday last. The day was favourable, and there was a large attendance. The show itself was a good one. Stove and greenhouse plants, Cape Heaths, Pelargoniums, Fuchsias, cut Roses, and other flowers, were plentiful, and there were a few Orchids.

PINKS were somewhat small in size. In the amateurs' class, for 12 varieties, the 1st prize was awarded to Mr. Baker, of Woolwich, for Sappho, Whipper-in, Lola Montez, Narborough Buck, Double X, Harriet, Alpha, Hark-forward, Criterion, Countess Rossi, and Mrs. Herbert; 2d, to Mr. Halladay, of Woolwich, for Alfred Morrison, Lady Mildmay, Double X, Lola Montes, Lord J. Russell, Hardstone's William, Agitator, Harriet, Jane Sarah, Brilliant, Winchester Rival, and Oxonian; 3d, to Mr. Edwards, of Wace Cottage, Holloway, for King of Purples, Lady Mildmay, Double X, Winchester Rival, Laura, Harriet, Oxonian, Prince Albert, Rosalind, Alfred Morrison, Mrs. Herbert, and Jenny Lind. Other exhibitors in this class were Messrs. Ellis, Hardstone, Venables, and Willmer.—Nurserymen: 24 varieties, 1st prize to Mr. Norman, of Woolwich, for King of Purples, Rosea elegans, Narborough Buck, Willmer's Surplice, Lady Mildmay, Whipper-in, Goliah, Lola Montes, Rubens, XX, Surpriser, Harriet, Brilliant, Diana, Criterion, A. Morrison, Laura, Morning Star, Alpha, Kate, Pickwick, Countess Rossi, Jenny Lind, and Melona; 2d, Mr. Ward for Narborough Buck, Lady Mildmay, Smith's Goliah, Harriet, Hillier's Goliah, William, Winchester Rival, Brilliant, Bell's Henry, Laura, Melona, Morning Star, Lord W. Russell, Prince Albert, Jenny Lind, Lord J. Russell, Willmer's Elizabeth, Duchess of Kent, A. Morrison, Creed's President, Alpha, and Countess Rossi; 3d, Mr. Bragg, of Slough, in whose stand we remarked, in addition to the flowers mentioned above, John Bull, Gay Lad, Sir Robert Peel, Benjamin, Nonpareil, Edward, British Queen, and Mrs. Hooper.

RANUNCULUSES: In the amateurs' class, the 1st prize was awarded to Mr. Airzee, for good blooms of Alphonso, Queen Victoria, Lord Byron, Ferdinand, Claudiano, Leonidas, Mrs. Airzee, No mistake, Bijou, Jenny Lind, and Valerius. Messrs. Franklin and Coster had Hogarth, Dr. Gardner, Orange Brobance, Milo, Mrs. Airzee, Demosthenes, Queen Victoria, Bensoniensis, Prince Albert, Venus, Intruder, Juliet, and Triumph.

In a stand of cut Verbenas from Mr. Lockner, we observed the beautiful scarlet, white-eyed variety called Shylock. Irises were furnished by Mr. Salter of Hammersmith.

In the Seedling tent were several novelties. Mr. Foster's Pelargoniums which were not sufficiently in

bloom at the last show, were this time shown in excellent condition. Optimum is a magnificent variety, robust in habit, large trusser, and free bloomer; colours, crimson scarlet, with black blotch in the top petals, shaded to the margin with vivid crimson scarlet; very attractive. Enchantress possesses the colours and shape of Gipsy Bride, but it is nearly twice the size; it is good in habit, and constant. Ariadne, rosy-purple, with dark blotch on the upper petals, a free bloomer, and a good exhibition plant. Rubens, crimson, with dark blotch on the upper petals, the latter being nicely margined with scarlet crimson, very stout. Fancy varieties were shown by Mr. Ambrose and Mr. Salter. Richard Cobden, in the way of Hero of Surrey, is a good shaped flower; Superbum, mottled rosy purple, is good in shape; Crispinum too much like Alboni, but showy; Symmetry is a nice flower, and Premier is a showy variety, but defective in form. Many others were too much like sorts already out. Several Pinks were shown; one, "Turner's Optima," rich dark lacing, on the purest white, was very evenly marked, quite smooth on the edge, and a large first-class variety; 22 blooms were shown, which served to prove its constancy. Mr. Bragg had several sorts, all of which were more or less rough on the edges. Mr. Costar had two seedling Ranunculuses, Madonna and Venus, both nice flowers. Banks' Verbena "Cynthia" is a pleasing light variety with purple centre. Pansies, Blanche and Swansdown, two good whites; Black Diamond, the darkest we have seen; and National, a flower described before, were shown in good condition. There was a promising Picotee, heavy purple, large and distinct, named Fellowes' Prince Arthur.

First class certificates were awarded to Mr. Black, gr. to E. Foster, Esq., for Pelargonium Optimum, Enchantress, and Ariadne. To Mr. Turner, for Pink Optima; ditto, Pansies, Swansdown, and Black Diamond; and to Mr. Bragg, for Pink Desdemona. Mr. Foster's Pelargoniums also received first, second, and third prizes from the "Seedling Fund." Mr. Turner's Pinks, first; Mr. Bragg's, second, from the same source.

Among Fruit, which was very scarce, was a nice dish of Black Prince Strawberry, from Mr. Cuthill, of Camberwell; a round medium sized seedling Strawberry, from Mr. Bragg, and some very fine British Queens, together with a Pine-apple, a few Grapes, and a Melon.

National Floricultural, *June* 26.—Several periodicals were presented on this occasion. Interesting stands of seedling Pansies were contributed by Mr. Hunt; collections of Pinks by Messrs Turner, Edwards, Norman, Bragg, Ellis, Ward, and Newhall; Antirrhinums by Mr. Joy, of Oxford; and Petunias by Mr. Wyness. Certificates were awarded to Pelargoniums Optimum, Rubens, Ariadne, and Enchantress, descriptions of all which will be found in our report of the Royal South London Floricultural Society of to-day. These were shown by Mr. Black, gr. to E. Foster, Esq. Mr. Rogers, of Uttoxeter, had a Pansy named Kossuth, which received a certificate. It is a large, rich, glossy, dark purple self, of good substance.—Mr. Ambrose's Fancy Pelargonium, Richard Cobden, was also distinguished by a certificate; as was a lilac-blue self Verbena, named Orlando, from Mr. Smith of Tollington Nursery, Hornsey-road. This is a showy large flowered variety. The same grower likewise sent a good red Verbena, called Koh-i-noor, which was, we believe, commended by the censors.

## Review.

*The Dovecote and the Aviary.* By the Rev. E. S. Dixon, M.A.; pp. 458. Murray.

The reverend author of this goodly tome tells us, in his preface, that his object has been "to ascertain the place which certain genera and species are likely eventually to take, in respect to their association with mankind, and to obtain a cognisance of the circumstances most immediately connected with that relationship." He also informs us, that "three of these essays have already appeared in *Bell's Weekly Messenger*;" and he attaches great apparent importance to the remarkable fact of their being "immediately transferred to the *Morning Herald*, and, perhaps, to other prints." In pursuance of his inquiries, he has introduced multitudinous extracts from all quarters, and from nearly all sources; so that the work may be regarded, on the whole, rather as a compilation than an original treatise. So many authorities, and so many opinions, collected together, must necessarily, to a certain extent, prove readable and interesting. It is to be regretted, however, that the author does not enter into his subject *con amore*; that is to say, he is diligent and painstaking in getting his materials together, but he lacks that true energy of style, and gentleness of feeling, which win upon a reader who is engaged heart and soul in his researches after "facts" in natural history. As a book of reference, it will be undeniably useful, and it will take its place in the library; but it is not a work adapted for the general reader, or for the multitude, whose delight is in keeping pigeons and doves; and yet it might easily be made so.

Six chapters are devoted to the "Dovecote," and 13 to the "Aviary." That the author understands the secret of "book-making," is evidenced in the construction of his chapters, with their running table of contents; each several item in which, under a distinct head, is printed in full. *Ex gr.*:—"Guans at the Surrey Gardens—their native habits and diet—our own mishaps—troublesome tameness of the birds—tricks and dangers—impudence and capriciousness—possible profitableness—narrative of a coadjutor—his ill success—our own—&c., &c." This will show the style of the author's "constructiveness."

We have been pigeon fanciers from our youth upwards to old age, and must be excused if we take *some few* of the rev. gentleman's remarks, connected with our domestic pigeons and doves, *cum grano salis*. We do not for one instant presume to call in question the truth of what he states as having occurred within his own experience,—but we demur to the dictum,—"*ex uno disce omnes*." There are many isolated facts, remarkable to witness, but which it would yet be dangerous for us to promulgate as being of common occurrence. Among other interesting topics of discussion, carrier pigeons, and the *causes* of their singular powers of traversing such long distances, are introduced. The remarks, *pro* and *con*, deserve attentive perusal. Dr. Gall considers, that they possess to the fullest extent the organs of "locality," and that this natural endowment explains the apparent mystery of their extraordinary "gift." We are *quite* of the Doctor's opinion; and can but wonder that the phrenological development, both in men and animals, has been hitherto so little considered. There can be no doubt that, in the carrier pigeon, the eye and brain are the principal,—the *only* active agents—save of course their swiftness of wing. All the known tribe of pigeons are treated of, in turn, and in some instances, they are "figured" in wood-cut illustrations. We are sorry that we cannot commend them as faithful or spirited delineations of the originals. In a future edition, should such be called for, it will be advisable to look well to this. Accuracy is of great importance in a subject of such interest.

By the way, we must, whilst noticing the wood-cuts, direct special attention to one of them, on the 58th page, designated "a pigeon chick a day old." *Certes*, the reverend author, when he limned so "remarkable" a creation, must have done it in a most happy moment. No person can say that, in making *this* "graven image," he has in any way infringed upon the "second commandment." The birds noticed under the head of the aviary include curassows, guans, crested turkeys, waterhens, kingfishers, ortolans, gulls, quails, &c. Of these latter some interesting details are given. They are horribly pugnacious animals, if allowed the range of a room, though perfectly tame when confined in a store-cage.

At the end of the book is a chapter on "the Nightingale," the natural history of which is now being treated of in another part of the *Gardeners' Chronicle*, by an amateur. Although little conversant with that branch of knowledge ourselves,—yet, as we have carefully perused *both*, we may remark that there seems to be a *little* difference in the sentiments of the two writers; for Mr. Dixon speaks of them with much *goût*, as being a fine relish for the dinner table. "Were they," he says, "to become the fashion at London dinners, they could be supplied during their season by the poulterers, at a rate not dearer than is paid for many delicacies, especially those out of season." He then launches out in praise of "singing birds" generally, as being most eligible for *entrées*, or the spit. By the way, even his favourite pigeons he does not spare. He advocates their being shot at, for wagers; and he thinks the amateur sportsman has a right (as well as the poulterer) to take their lives *ad libitum*. What about the "wounded?" On this point, deponent sayeth as little as may be. The "scouts" *sometimes* "kill" what have been already "wounded!"

Despite these and sundry other moral blemishes which disfigure the work, it will be perused with interest It is well and handsomely printed.

## Garden Memoranda.

Exotic Nursery, King's Road, Chelsea.—We understand that the Victoria Regia in Messrs. Knight and Perry's very interesting Aquarium, opened its first blossom on Wednesday last, and that three more flower-buds are appearing. Nymphæa rubra, sanguinea, and cyanea are also, we believe, in bloom, as well as dentata and cærulea. The two latter grow and flower in the greatest luxuriance here, conditions indeed common to all the plants which the tank contains. Some very fine new herbaceous Pæonies are also in flower, and well worth inspection.

Royal Nursery, Slough.—Pelargoniums and Pinks are now at their best here: the former are blooming profusely, and the plants are very dwarf and bushy. The Fancies give life to the other kinds, which, without them, would present too much sameness. Some of Mr. Foster's seedlings are very beautiful. Several of the Pinks raised by Mr. Smith were in excellent condition. This was the case with Huntsman, Whipper-in, Diana, and a seedling. The following were also good in colour and size:—Lola Montes, Sappho, Criterion, Narborough Buck, Countess Rossi, Kossuth, Pindar, Double X, Diana, Queen of England, Harriet, Great Britain, and a seedling named Optima, the finest in the collection. Perhaps the most interesting subjects here, at present, however, are the Carnations and Picotees, which are now coming into bloom. The greatest vigilance is employed to keep down green fly; continually brushing them from the points of the shoots is considered to be the most effectual remedy; this is performed by boys with small brushes. The principal object is to keep these pests down; if they once get ahead the mischief is done, and the chances of a good bloom are diminished. Now, that the weather has set in warm, Mr. Turner has the pots occasionally turned round; watering at this critical time (swelling of the buds) is considered of great importance, and receives much attention—weak liquid manure being used once or twice a week. There is every appearance of a good bloom, but it will be as late as the 20th or 30th of July. The operation of piping these flowers, as well as Pinks, had commenced, under glasses, about 1 foot square, with small holes for ventilation in their tops. These are placed on raised hot-beds, with considerably more heat in them than would be desirable with smaller glasses. Dahlias are planted in large numbers, and are looking robust, but rather late. Hollyhocks will be very attractive next month, when the Carnations and Picotees are in bloom. A large house of specimen Fuchsias of the leading kinds, and some seedlings raised by E. Banks, Esq., are just coming into bloom, and will soon be worthy of inspection. The sorts are not sufficiently forward to report on them at present. Voltigeur and Expansion were the best; and Géant des Batailles here, as everywhere else, was the gayest of the Roses.

## Miscellaneous.

*Hints on Mushroom Growing* (By Mr. J. Murray, Hunmanby Hall; read to the Caledonian Horticultural Society).—As the Mushroom is in a great measure what is termed a chance production, especially when compared with other vegetables, it follows, that anything likely to throw a ray of light on its more easy or certain culture, will be acceptable to many of your readers, more especially to those who are required to grow Mushrooms for their employers' taste. I may premise, before detailing my method, that I have nothing particularly new to offer, there being only a slight difference in my mode of management, from that generally followed by most growers; but from apparently trifling differences, in the mode of growing many crops, very different results often follow. Even the different inferences men draw from the meaning of a word or sentence, may be productive of good or evil to the crops under treatment, just in proportion as the operator leans to the right or wrong side of nature's law. The truth of this appears to be obvious when we see some men fail under equal advantages, to bring some plant, fruit, or flower, to the same perfection which others have arrived at, even though they are to all appearance completely initiated in the art. This certainly proceeds from only following the leading features of the method, and neglecting that which is of the first importance in the working out of any plan or system, complete attention to its minor details. In preparing dung for the Mushroom bed, it should be got with a sufficiency of short litter to keep it open, and spread or ridged in the common way, in an open airy shed for a few days, to divest it of its superfluous moisture; but by no means to expose it until it becomes dry to the look, as much of the success of the grower depends on his retaining a sufficient natural humidity in the dung. When a sufficient quantity has been collected and has undergone the necessary preparation, it should be shaken up into a conical heap with the dung fork, and all long and unnecessary litter shaken out, leaving it in the proportion of one-fourth short litter to three-quarters of droppings. This operation completed, the bed should be made up without delay to any required length and breadth, and 10 or 12 inches deep at least, as shallow beds are liable to get too dry. Beat every layer of dung as it is laid on, but not to that degree as to render it hard; it is sufficient that it be slightly firmed. There should be no earth mixed up with the dung, neither for the purpose of rendering the bed more compact, nor with the idea of benefiting the crop thereby; at least, so far as my experience goes, it serves no purpose. Such beds as I have had beat in the usual way, and mixed with a small quantity of mould, were decidedly inferior, as regards the size and quantity of Mushrooms, to those that were composed solely of dung and more sparingly beat. A slight top-dressing of droppings two-thirds, and fresh mould one-third, may be practised with advantage, provided the covering of mould be light. To prevent the dung taking a burning heat, make it only 9 inches deep or so at first, and allow some of the heat to pass off quickly, then add other 3 inches. The spawn should be prepared by steeping it in water at a temperature of 65°; the time it should remain in the water depends very much on whether it absorbs water readily or not. There is therefore no rule for this operation, farther than allowing it to remain in the water until pretty well moistened, then lay it on the surface of the bed until required for spawning. On the third or fourth day after being put up, the bed will in all probability have taken a pretty strong heat; it should be bored as soon as the heat is up, 8 or 9 inches apart; but if the heat is likely to be very violent, it should be gently eased up with a fork for a short time, until the heat has considerably declined, then press back to its former solidity, and bore as before. A burning heat must be particularly guarded against, or the bed will lose substance speedily by evaporation, and in all likelihood prove all but a failure. When the heat is about 70°, and on the decline, the bed may be immediately spawned, by introducing small pieces into the holes made in boring. A few pieces may also be crumbled down by the hand, and spread over the surface of the bed, then give a light beat with the back of a spade. It will now be necessary to give a light covering of fresh mould, if from a heap that has lain for two or three years, so much the better; it may either be sifted or laid on after being well broken with the spade to the depth of about one inch at most.

I think it will be found, by those willing to make the trial, that a greater depth is injurious to the full development of the Mushroom. I believe a slight mixture of soil on the surface of the bed, with a covering of sphagnum moss, would answer well. Next in order to earthing, is to cover the bed with a light covering of straw, to prevent a too rapid evaporation from the surface. The longer the natural humidity is kept in the bed by covering, and surrounding it with a moist atmosphere, the better. Whenever signs of dryness appear, give a gentle watering with water at the temperature of 65°. Neglect on this head is dangerous, as much more mischief is to be apprehended from the bed getting too dry than from damp. It is advisable to leave the straw covering off the bed for a few hours after watering, to prevent the surface getting damp and mouldy, which might probably be the case if covered up at once, especially when the atmosphere of the house is kept well charged with moisture. A bed, treated after the manner described, with a house temperature of 55°., will in all probability produce Mushrooms in the fourth or fifth week at furthest, and yield a plentiful supply for three months, the majority of the Mushrooms being from 4 to 6 and 7 inches in diameter. A certain degree of light, heat, and a humid atmosphere is indispensable to the successful growing of the Mushroom. The necessity of heat and humidity will readily be admitted by all; but why light should be excluded from the Mushroom house appears to me to be a mystery rather difficult to solve. We might as well argue, that because some Potatoes had been grown in cellars, all Potatoes should be grown there, were it not that we have the direct evidence of our senses against such fallacious logic. The main error which many commit in Mushroom growing, is in drying the dung too much, too hard beating, and farther, loss of moisture by a too active fermentation, all of which must render the bed unfit to produce but a very scanty crop, more especially when dry spawn is introduced into a bed in this condition, which cannot yield it the necessary moisture to cause it to run freely. Hence it follows, that after two or three months' fruitless expectations, and several heavy waterings, a small cluster of bitter Mushrooms are produced over the piece of spawn, instead of fine ones of the natural size. *North British Agriculturist.*

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

Now is a good time to sow seed of Chinese Primroses for winter and spring flowering. Old plants may have the soil partially removed, and be then repotted in a compost of loam, a little well-decayed cow manure, and leaf-mould, with a portion of sand. By placing them in a cold frame in a shady situation, and keeping them close for a time, they will be useful for furnishing a supply of flowers during the early part of winter. Some seed of the Humea elegans should now be sown both for furnishing the conservatory next year, and for plants to turn out into beds in the flower garden; or for any of the various decorative purposes, for which this fine plant is so well adapted. Seedling Cinerarias, for autumn and winter flowering, should be potted as they require it in light rich soil, containing about one-fourth of loam. The plants obtained by dividing the old ones of approved sorts should be stimulated into vigorous growth, to produce fine specimens for late flowering, by repotting them progressively, as soon as the roots reach the sides of the pots. It will, however, be advisable to retain a portion of the plants in small pots, for flowering during autumn and early winter.

FLOWER GARDEN AND SHRUBBERIES.

Perhaps no plants are more generally useful than the hardier kinds of Carnations, Picotees, and Cloves; their beauty and fragrance not only recommending them to a prominent place in flower beds, but also rendering them invaluable for glasses or bouquets. If pipings of them are taken off about this season, they sometimes strike as freely as Pinks; but the operation will be more certain to succeed if the hand-lights are set on a slight hotbed, or the pots plunged in a frame where there is a gentle bottom heat. Points that require special attention are—that the cuttings be taken not later, on any account, than the expanding of the first flower, and that they be carefully shaded from every ray of sunshine. The most certain method of propagating them is by layers; but it is equally important that this operation be performed early, as the plants root sooner, and thereby become better established before winter; but in all cases it will be found the most satisfactory mode of proceeding, to defer the transplanting of Carnations raised from layers till the spring following; as, if transplanted in autumn, they are liable to be thrown out of the ground by frost. Where the locality is unfavourable, it sometimes becomes necessary to remove the young plants to a frame during winter. Late sown annuals, intended for autumn flowering, should be thinned out or transplanted before they crowd one another, and become too weak to support themselves, choosing moist weather for the operation. Timely tying, staking, and regulating of all plants is of much importance, both as regards the effect produced, and the time occupied in doing so.

FLORISTS' FLOWERS.

Seedling Ranunculuses will now require taking up; generally speaking, they are so very small the first season, that without great care, many may be lost. Perhaps the better way is to get a fine wire sieve, in which compost and roots together may be put; this may then be placed under a pump, and a stream of water allowed to pass through; by this means the soil will be washed away, leaving the root in the sieve; these may then be spread out, and gradually dried in a shady place. The bulbs on the main beds will require attention, inasmuch as they are seldom ready to be taken up all at once. Some of the Grass will become yellow before the other; these should be lifted directly, for if allowed to remain and showery weather sets in, they will immediately make a second growth, to the serious and often irreparable injury of the root. TULIPS.—As the foliage decays, let these also be taken up and stored away for drying; let the place be shady. We recollect a number of valuable sorts being put into a glazed frame to dry; the consequence was that they were all destroyed, assuming a disease which made them impenetrable to the thumb nail. Auriculas, Dahlias, &c., as last week.

KITCHEN GARDEN.

As every available means should be adopted for stimulating the various crops into a vigorous growth, let due use be made of liquid manure, if this valuable auxiliary can conveniently be obtained. This is the best time of year to make use of it, by applying it to all plants which are cultivated for the sake of their roots, stems, or leaves, the object being to induce a luxuriant growth, and to prevent or retard the production of flowers or seeds. Make every provision for autumn and winter, by planting good breadths of Brussels Sprouts, Cabbage, Savoys, Broccoli, and other winter vegetables, taking care that the ground be previously well manured. Let there be no idle ground in this department; but, as the quarters are gradually cleared of their summer occupants, let them be succeeded by something else. Celery planting should also be completed with the least possible delay. Sow Chicory, Endive, Parsley, American Cress, &c., for winter; and Lamb Lettuce or Corn Salad for late autumn use. Kidney-beans, Peas, and other crops with weak collars, should be earthed up before they are blown aside. A supply of Watercress for the autumn and winter may be easily obtained by planting some strong young tops, about 4 inches long, in a line at the foot of a north wall. The cuttings should be of pieces which are protruding roots from the joints. The Watercress will grow freely in such a situation; and in many places where there are no artificial beds, and where natural ones are a considerable distance off, these will be found very useful. Supply the young plants with plenty of water until they are rooted.

State of the Weather near London, for the week ending June 26, 1851, as observed at the Horticultural Garden, Chiswick.

| June. | Moon's Age. | Barometer. | | Temperature. Of the Air. | | | Of the Earth | | Wind. | Rain. |

The highest temperature during the above period occurred on the 5th, 1846—therm 95 deg; and the lowest on the 30th of June, 1848, and 1st of July, 1837—therm. 37 deg.

## Notices to Correspondents.

BEES: *S D E.* The article enquired for can be obtained at Milton's, 10, Great Marylebone-street, London. *Y.*

BIRDS: *Louisa C.* Your surmise is correct. Your *skylark* may be, and no doubt is, a beautiful songster; but the "variety" of his notes, resembling so greatly those of "other songbirds," is *not* reckoned a desirable qualification, and prevents his being deemed "first-rate." If you will carefully peruse the series of "Treatises on the CANARY," you will therein find the question of "a bird's early education" fully discussed. Birds, like the human race, are, in their infant state, open to receive the earliest impressions—either good or otherwise. Hence the necessity for causing them always to be found in the best company. With them, as with us, "evil communications" act prejudicially; and bad habits, though easily acquired, are *not* so easily eradicated. It is pleasing to know that you take such an increasing interest in the subjects now under discussion. Observation, and practical experience, joined to your zealous and inquiring mind, will soon make you a proficient in what you are so desirous to learn. You have selected a delightful branch of study, and will never regret having made *such* a choice. *W. K.—M W K.* What has been told you by the countryman about the *nightingale*, may or may not be true. Admitting, however, that he *has* had it in his possession a month, and that it *has* "sang delightfully," it is *now* quite off song, and will remain so for six months. The injury done to the bird's leg, induces us to advise you *not* to purchase it; unless, indeed, the limb be already restored, and the bird have the full use of it. The value of nightingales, after Midsummer, is so exceedingly trifling, that it would be an act of folly to provide yourself with a cripple; more especially when others may be readily obtained, sound both in "wind and limb." *W. K.—Annie J.* The bird you describe so accurately, is the *golden-crested wren*—a beautiful little creature, truly. By no means attempt to do as you propose, but give him *instant* liberty. Perhaps he has a fond mate, anxiously expecting him to share with her the heavy and wearisome duties of incubation; perhaps a large family, to assist in feeding. At this season, it is sinfully cruel to immure these innocent, gay, happy, confiding creatures. I grant that it is often done, as in your case, from a mistaken act of intended "kindness." Reparation is easily made. Fly at once to the rescue of your little "prisoner of hope," and let me assure you that by giving him *his* liberty, you will thereby greatly add to *your own* happiness. *W. K.—An Old Maid.* Unripe, green food, is of various kinds; for instance, Chickweed and Groundsel before they are in full flower, or seeded; and indeed *any* rank vegetable produce. Birds suffer as much from partaking of these crudities, as we do from eating sour fruit. Watercresses are an agreeable change for a Canary. *W. K.*

FIRS: *Dedhamiensis.* You had better wait till winter before you cut them down.‡

INSECTS: *C C.* The insect sent is the preparatory state of the lady-bird (Coccinella 7-punctata) which feeds on the green flies of Roses, &c. When full grown, it fixes itself to the plant, and in a few days it comes forth in the perfect form. See Westwood's "Introduction to Entomology," Vol. I. *W. —A R H.* Thanks; but we should be glad for some information respecting the insect sent. *W.—Clericus rusticus.* The transformations of the Gooseberry grub are represented in the accompanying wood-cut, and a full description of the insect is given in the *Gardeners' Chronicle* for 1841, p. 548. 1, a twig of the tree; 2, the eggs; 3, the larva; 4, the cocoon formed under ground; 5, the perfect insect, Tenthredo Ribesii, or Grossulariæ. *W.*

METEOROLOGICAL INSTRUMENTS: *M.* In commencing a series of observations on the weather, the instruments should be placed so as to indicate the natural climate of the locality, as nearly as circumstances will permit. Artificial interferences should therefore be guarded against. Thermometers, for example, should not be placed, as they too frequently are, so near the wall of a house as to be greatly influenced by radiation. In such a situation they occasionally indicate several degrees above freezing, whilst at the same time Grass, at a little distance, is hoary with frost, and tender vegetation is destroyed. In the "Instructions for making Meteorological Observations," by a committee of the Royal Society, the thermometer is directed to be fixed upon a bracket projecting 8 inches from the wall, or other support, to be completely sheltered from rain, and where no reflected sunbeams from water, buildings, rocks, or dry soil can reach it. Delcros, in the "Annuaire Météorologique de la France," recommends the thermometers for external temperature to be placed not less than 30 centimetres, or about a foot from, the wall; but adds that an open space is to be preferred. We fully agree with him; and would advise you to place them on a piece of lawn; the one for registering the maximum temperature in the shade, about 4 feet from the ground, screened from the sun's rays, but exposed to free circulation of air; there should be one for the minimum temperature in the shade, another for the maximum in the sun, and each of these should be about a foot from the ground. The barometer should be placed exactly perpendicular, and where it will not be liable to be affected by currents of air, and sudden changes of temperature. The rain gauge should stand on the ground. We believe the arrangement above sketched out is the simplest and most correct you can adopt for the objects you have in view.‖

NAMES OF PLANTS: *Ipomœa.* You are called "Quamoclit" by your countrymen in Mexico, but as we do not understand Mexican, we must refer you to them for further information. —*G C R.* Cephalanthera ensifolia.—*W P.* We do not see how it differs from the common Vetch, Vicia sativa, a very variable plant.—*Halifax.* Hakea pugioniformis.—*M K.* Sempervivum villosum, Nicotiana undulata.

ROSES: *M D* says, "My garden, which slopes to the west, was formed in the autumn of 1849. The field had been bearing an excellent crop of Wheat, which was just harvested. All the flower borders were trenched 2 feet deep; the soil is a rich brownish loam, varying from 1 to 6 feet deep, lying upon what is called here 'Coome Rock' (a rich calcareous marl), beneath which is a thick bed of chalk. This being my soil and situation, can you kindly explain the following facts? I planted, in 1849, about 60 Rose trees—standards and dwarfs; these were obtained from Uckfield, near Lewes, and were good healthy plants. Last year they grew well, and flowered very freely for the first year; this year, however, the majority of the flowers are abortive, as in the accompanying specimen—the buds being hard in the centre, and composed of an agglomeration of green leaves, in place of petals. I should mention, that most of these Roses were planted without manure. Can you explain the cause of this? and, still more, can you suggest a remedy? The dwarfs have, on the whole, suffered much more than the standards." The centres of these Roses are all converted into leaves in the usual way. Of the *cause* we can form no opinion, can any correspondent?

VINES: *Z Z Z.* We do not believe that pruning Vine roots three years ago can be the cause of fine old plants that used to bear a ton of Grapes, having this year but six bunches. It is more likely that in your wet land, the roots have got below the level of your drain tiles; more likely still, that the true cause is unskilful management.—*Constant Reader.* Your leaves do not seem to ail much. Probably, they have been grown at one time in a very warm, damp atmosphere—and have since been exposed to a lower temperature, and much more dryness.

WEEDS: *Mrs. H.* The plant is the Buck's-horn Plantain (Plantago coronopus), of which you can only rid yourself by continually pulling it up; unless you can pare and burn your lawn, and re-turf it with better materials.

MISC: *T G.* We shall feel obliged by the papers you mention.‡

### SEEDLING FLOWERS.

CALCEOLARIAS: *Beginner.* Not so good as similar kinds already out.*

PANSY: *P P.* Dried up.*

PELARGONIUMS: *Beginner.* Apparently a fair second class flower.—*W D.* A nice horse-shoe leaved variety, and a good trusser.—*T E.* The petals had all dropped, and were mixed together when your package reached us. Flowers loosely placed in a box can never be expected to travel safely.*

POTENTILLAS: *W W.* All dropped to pieces when received. Some of the petals exhibited great richness of colour.*

ROSES: *W W.* A good flower; but not better than many of the same class now in cultivation.*

VERBENAS: *W D.* Not so good as Princess Alice and many others.*

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by Dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

ARTIFICIAL MANURES.—PRIVATE INSTRUCTIONS in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.

Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

SHALE MANURE.—The Bituminous Shale Company can now supply Pulverised Shale Ashes in sacks at 2l. 10s. per ton, delivered at any station or branch line of the South-Western Railway, and at the Terminus, Nine Elms.

This valuable Manure is at once cheap, durable, and fertilising, and will be found to be superior to all others for Grain, Grass, and Root crops.

A singular property of this Manure is that it entirely prevents the ravages of the Fly in Turnips and Hops; it is also utterly destructive of the Wire-worm.

Orders to be addressed to the Bituminous Shale Company, 145, Upper Thames-street, London, where also testimonials from the first agriculturists of the day may be obtained.

ALGERNON POLLOCK, Secretary.

ANTHONY'S PATENT AMERICAN CHURN has obtained a Prize at every Agricultural meeting at which it has been exhibited; and the Proprietors have sold upwards of 2000 in one year, and received from all parts of England the highest testimonials in its favour both as to the short time required, the quantity and quality of the Butter made, a copy of which testimonials, with prices, will be forwarded on application to BURGESS and KEY, 103, Newgate-street, Sole Agents to the Proprietor.

HOSE FOR LIQUID MANURE, Fire-engines, and agricultural purposes, made of canvass, lined and coated with gutta percha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure; it is extensively used at the Government public works, also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

HOSE! HOSE!! HOSE!!! Improved Canvas Hose, Lined and Coated with Gutta Percha for Liquid Manure, Fire Engines, Garden and Farm purposes.—This Hose is greatly improved. The rigidity of seam avoided, the flexibility increased, the waterproof qualities extended, the price more reasonable. Much research and trial by the Manufacturers, has enabled them to arrive at what they consider a perfect Hose. Improved Gutta Percha Union Joints of all sizes. Gutta Percha in all its branches.—Apply to Messrs. MITCHELL and Co., 93, High Holborn, London; International Depot for Patented and other Inventions.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.

PATENT VULCANISED INDIA-RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and) Manufacturer, Goswell Road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use; are particularly suitable for Fire Engines, and are found exceedingly useful in dwelling-houses for conveying Hot or Cold Water to Baths, &c.

Testimonials and prices may be had on application to the Manufactory.

N.B.—Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

All Letters or Orders addressed to J. L. HANCOCK, Goswell Mews, Goswell Road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boats, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers: Office, 70, Strand, London.

DR. NEWINGTON'S PATENTED AGRICULTURAL IMPLEMENTS. These Patents having been withdrawn from a firm under the name of DUFAUR and Co., in consequence of the unsatisfactory manner in which the inventions have been carried out, and the imperfect state in which the implements have been manufactured, have been assigned to Mr. GABRIEL, C.E., &c., of the Surrey Chambers, Arundel-street, Strand, London; agriculturists are informed that specimens of the Implements, viz.—The Hand Cultivators, Dibbles, Hand and Horse Drills, Manure Distributors, single-horse Ploughs, &c., can be seen there, as well as in the Agricultural Implement Department in the GREAT EXHIBITION, HYDE PARK. N.B. The Patent Dibble obtained the Prize awarded by the Royal Agricultural Society at Norwich, in 1849. Improvements have recently been made in the Drop Drills and Manure Distributors; they are lighter, can be turned round with ease, and there is a contrivance for stopping the escape of the seed at pleasure.—Catalogues, with engravings of the Implements, and numerous Testimonials, can be obtained upon application at the Surrey Chambers, Arundel-street, Strand, London.

The Agricultural Gazette.

*SATURDAY, JUNE* 28, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

| | | |
|---|---|---|
| WEDNESDAY, July | 2 | Agricultural Society of England. |
| THURSDAY, | 3 | Agricultural Imp. Soc. of Ireland. |
| WEDNESDAY, | 9 | Agricultural Society of England. |
| THURSDAY, | 10 | Agricultural Imp. Soc. of Ireland. |

THE high price of guano, reduced as it is to one half of what it was a few years ago, has been complained of by some writers in this journal, and defended by others. The complainants attribute it to monopoly on the part either of the Peruvian Government, who are the proprietors, or of Messrs. GIBBS and Co., the importers, their agents. Some invoke the diplomacy of the foreign office; and there are not wanting those who would have it demanded under the guns of Admiral PARKER. We can only say that they who are dissatisfied with guano at its present price have other resources. It is curious to observe how in this matter the farmers encourage the foreigner and neglect native industry. We import guano to the value of more than a million annually, and waste home-made manure of as good or better quality, to the value of many millions. We do not here allude to those black pools with which even now, after all that science and practice have taught and done, during the last 10 years, are still to be seen in the majority of farm-yards, where they serve as temporary receptacles of the dark porter-like-looking fluid, till it suits the convenience of the farmer to turn it into the nearest stream, or form nurseries of typhus for the neighbourhood, if it should not be so fortunate as to possess a stream into which it can be turned. Our remarks apply to the sewage of towns and the mine of wealth which it contains, richer than those of California, if our capitalists could but be inspired with sufficient confidence in its value to undertake the working of it; if the crotchets and individual interests which prevail in municipal bodies would permit its application, and if the prejudices of farmers in favour of the exclusive use of solid manure, as of all other established usages, would allow them to profit by the treasure when placed within their reach.

The greatest obstacle to be encountered in the application of the sewage of towns to the land consists in this, that a large preliminary outlay of capital for pipes and steam-engines is required to convey it from localities where it is not only worthless but a nuisance, to others where it would become valuable; and that if companies were formed to undertake this outlay, they would run great risk of sinking their money unprofitably, from the reluctance of farmers and landowners to adopt anything new. This prejudice against the use of liquid manure is not likely to be diminished by a dictum which has recently issued from a quarter deservedly looked upon as of high authority in agricultural matters, that liquid manure is a pretty toy, but solid dung is for farming in earnest.

With all deference we would remind Mr. PUSEY, who has uttered this sweeping condemnation on manure in the form to which it must be reduced before plants can take it up, that very few years have elapsed since the use of guano and other portable manures was denounced in terms equally decisive and authoritative by practical men, the denunciation being generally clenched by the reply of the Scotch farmer to Lord KAMES, "that he who carried manure to the field in his waistcoat pocket, ran great risk of bringing home the crop in the pocket of his coat." We shall not enter into the general question whether manure is best applied in the solid or the liquid form. On this, as on every point of practice in agriculture, there is the usual difference of opinion and the usual amount of discordant facts or reputed facts. In every farmer's club in which the subject is discussed, at least a dozen speakers will be found on each side of the question. One set describe the splendid crops which they obtained by the use of liquid manure, the other declares that they have tried it in all forms, on all soils, to all crops, at all seasons, and have either found it useless or positively injurious. Some admit the value of liquid manure, if a cheaper mode of distributing it could be devised than by means of the water cart; others declare as the results of their practical experience, that even thus applied they find it the cheapest and most efficacious manure which they can use. It is sufficient for our purpose that there exists in the sewage of towns a vast quantity of valuable manure which can only be used in the liquid state. Its profitable application depends on the following questions: the cost at which it can be conveyed from the towns to the rural districts, the cost of distributing it over the farm when placed within reach of the cultivator, and the value of the manure when thus rendered available. To all these questions satisfactory answers can be given. To begin with the cost of conveyance into the country. It is calculated by experienced engineers, that sewage water may be raised by the steam engine 150 feet, and forced through iron pipes in the way the supplies of water are brought to most large towns, and thus conveyed and sold with a profit at 2½*d.* the ton, after being conveyed in this manner 14 miles. The practice of the water companies of the metropolis confirms these calculations. The supply of water to London is not conducted in the most economical manner. Under the competition system we have three or four expensive establishments laying three or four sets of mains down every street, where one set of mains and one set of superintendents would suffice. The consumers are burthened with the extra expense attendant on such a system, and yet under these disadvantages the contractors for watering the metropolitan roads resort to the standing pipes of the water companies as the cheapest source of supply. They pay 20*s.* for 100 tons, and at this rate they find the water costs only one-half of the mere labour of pumping it from wells provided for their use at convenient distances by the road side. It would be an insult to the understanding of our readers to remark that foul water can be conveyed out of a town, at as low a rate, by the same means, as pure water, or water professing to be pure, is conveyed into it. The water companies, again, have furnished us with practical proof that the cheapest mode of removing refuse is in a state of suspension in water. The West Middlesex Water Company were about to contract for the removal of the silt which had accumulated for 8 or 10 years in their reservoir at Kensington. The cost of removing this deposit, which covered nearly an acre, was to have been 400*l.* It occurred, however, to one of the officers, before the contract was accepted, that the cleansing might be better effected by stirring up the silt, mixing it with water, and then cutting an outlet in the main-pipe, by which the water was conveyed to London. The experiment was tried, and the refuse was removed in this way, in three or four days, at a cost of between 40*l.* and 50*l.* The reservoir is now cleaned in no other way; and the sediment washed into the common sewer.

The evidence as to the cost of distribution over the farm is equally satisfactory; whether as regards the capital required for the distributing apparatus, or the labour necessary to apply the manure delivered by the pipes laid down under the land. There are two farms on which this mode of distributing liquid manure has been successfully used; the farm of Mr. HUXTABLE, in Dorsetshire, and that of Mr. KENNEDY, of Myre-mills, in Ayrshire. Both are equally satisfactory; Mr. HUXTABLE, however, is an amateur farmer, and therefore we pass over his operations, of the success of which we have been eye-witnesses, for those of the more practical Mr. KENNEDY, and the report of the practical men deputed by the Berwickshire Farmers' Club, to examine the merits of the system. The propriety of applying all the manure of the farm in the liquid form, which is Mr. KENNEDY'S object, the deputation left an open question. It is a question, moreover, on which Mr. KENNEDY himself maintains a prudent reserve, merely declaring that, as far as his experience has gone, he is satisfied with it. The report of the deputation however was decisive as to the economy of the mode adopted at Myremill for distributing that portion of the farm-yard manure which is naturally liquid; and which in ordinary practice is for the most part wasted. The farm consists of 400 statute acres. Capacious and substantial tanks have been built, a stream of water has been brought a mile for the purpose of diluting the manure, and iron pipes have been laid over the whole farm. The cost of the collecting and distributing apparatus does not exceed 30*s.* an acre. A steam engine of 12 horse power, which performs the threshing, winnowing, grinding, chaff cutting, and other ordinary operations of the farm, forces the liquid manure through the pipes into the fields. One stand-pipe is sufficient for 10 acres; and from this, by means of a gutta percha hose, one man to direct the jet, and a boy to assist in moving

the hose, manure 10 acres a day. Of the 400 acres, 70 are under green crops consumed in the yard. Estimating the roots at a medium crop of 25 tons, the straw at 300 tons, and the Italian Rye Grass, cut thrice, at 20 tons; this with 1000 tons of water used for diluted the liquid, and dissolving the solid manure, amounts to 4000 tons. The distribution of it over the farm was calculated by the deputation to cost 75*l.*, including engine power, men directing hose, interest, and wear and tear of pipes and tanks. The distribution of the equivalent quantity of solid manure, including filling, carting, turning, filling, carting again, and spreading, they made amount, at 1*s.* a ton, to 150*l.* The conveyance, then, of the sewage of towns to a distance into the country, by means of underground pipes, appears to be practicable and economical, and the distribution of it over the farm by means of a minor system of pipes, equally practicable and economical. For proof of the former, we appeal to the practice of the metropolitan water companies; for proof of the latter, to the practice of Mr. KENNEDY, of Myremills. That, however, only goes to the distribution of the liquid manure of the farm. The value of the sewage of towns, and whether its manuring powers are such as to repay the cost of application, are independent questions, which will require separate consideration. *E. W.*

## REPORT ON THE AGRICULTURAL SECTION OF THE GREAT EXHIBITION.

No. VIII.—CHAFF-CUTTERS are present in every form. The economical supply of food in cattle feeding is one of the most momentous points of husbandry; and an efficient chaff-cutter, requiring but a small amount of motive power, is certainly one of the most valuable agents towards effecting it. Many kinds of these machines have been invented; and it becomes important to ascertain whether boxes with radial knives, or knives upon a transverse cylinder—whether one or more knives—whether ratchets or worms or pulleys or gearing wheels—are best for their respective purposes. We cannot here enter into a discussion upon these points; but we may mention the result of the trial of the best chaff-cutters of different sorts at Exeter; the general excellence of each standing forth in comparative numbers in the table. Several of the machines now in the Exhibition were tried in cutting chaff ⅜ of an inch in length.

| Names. | Comparative Amount of Power in Units that would be required to cut 112 lbs. of Chaff. |
|---|---|
| Smith and Co. ... ... | 20,407 |
| Richmond and Chandler | 33,152 |
| Garrett ... ... ... | 29,792 |
| Cornes ... ... ... | 23,096 |
| Williams ... ... ... | 23,341 |

The work performed by Cornes's was found to be the best; and although the power required to drive it was somewhat more than for Smith's, the prize was awarded to the former. The most generally employed form of knife, as exemplified in Cornes's, Smith's, Stanley's, and other chaff engines, is radial and curved—its cutting edge being on the convex side; and either one, two, or three knives are affixed to the fly-wheel. Instead of a direct chop, these knives give a quickly drawn cut—so that, in Smith's machine, five feet of cutting edge are drawn through a width of straw that might be chopped by a straight knife only a foot and a half long. It is this drawing principle which has rendered the best chaff engines capable of cutting up threshed straw for litter. Different speeds of gear work for altering the length of the cut, seem to be more than ever employed; and with contrivances more or less simple for putting them severally in train. W. P. Stanley, of Peterborough, exhibits a three-knived chaff-cutter, in the gear-work of which not only different sized pinions, but also an additional motion is used, so that a variety of different speeds are obtained, instead of only three, as is the case when there is only one additional shaft or axle. A lever handle is set into one of three notches—the middle one throwing the whole wheel-work out of gear, and the two extreme ones reversing the motion according to the wheels then turning the rollers. The lengths cut vary from ¼ to 2½ inches. The material to be cut is drawn forward between two rollers, the upper one being weighted by a lever, so as to rise and fall according to the irregular quantity in the box.

Lomax's Patent Chaff-cutter appears to be a successful attempt at giving the motive power more leverage over the work without narrowing the width of the box. In the general form of cutter, the power acts at a great disadvantage when the knife is cutting the material on that side of the box front farthest from the axle of the fly-wheel on which the knives are fixed; in this machine the axle is placed above the middle of the box instead of at its side, and carries three short knives of a peculiar triangular form, with convex cutting edge. The length of the cut is altered by gearing-wheels of different speeds.—Barrett and Co. have a chaff-cutter in which the rollers are moved by a ratchet and bar alternated by a cam upon the main shaft. The length of feed is regulated by a stud upon the ratchet bar, which is set nearer to or further from the side of the cam, the bar being shifted more or less according to the place of the stud.

We are merely noticing a few of the different peculiarities and ingenious contrivances attaching to the several varieties of chaff-cutters, and not attempting a particular description of any one. Mary Wedlake and Co. exhibit a small chaff engine, having a bruiser fixed upon one side of the box, so as to be actuated by the main shaft, and which can be put in or out of gear. In one of Garrett's chaff-cutters we observed an excellent arrangement of the weight which presses the material to be cut; if the feed is increased beyond a certain amount, the lever beneath the box, carrying a weight at its end, rises so as to take a second weight off the ground; and this extra pressure, when there is a greater bulk of straw for the knife to pass through, is found very advantageous.—Smith and Co., of Stamford, seem to have especially devoted their attention to the lessening of the friction of the material upon the bottom and against the sides of the chaff-box, and to the prevention of any irregularity or stoppage of the feed. Thus they devised a superior chaff-cutter, in which the whole box was made to move forward with the material, which was pinched between an upper roller and a plate upon the bottom of the box. They have now made the box itself a fixture, but the bottom is composed of an endless web, on rollers, which advances with the material upon it. An upper roller having conical spikes also helps to draw and press the material. There are two radial knives, with convex cutting edge; and in addition, a series of small vertical saws are made to vibrate up and down in front of the box face, so as thoroughly to cut up the material, and not suffer any straws to escape by coming athwart the box. This machine, owing to its peculiar construction, will effectually cut up straw into litter, and this of any length from ¼ inch to 5 inches.

Richmond and Chandler, of Manchester, exhibit their excellent chaff-machines, with teethed rollers, which claw the material forward; and Crosskill his three-knived cutter, with ribbed and plain rollers, and pulleys of different sizes for altering the length of cut. The patent Guillotine Chaff-cutters, invented by Gillett, of Brailes, near Shipston-on-Stour, Warwickshire, are so well known as to need no remark; we believe their efficiency is equal to the ingenuity displayed in them, but the sliding motion, delicate as that of a steam-engine, does not seem to be so well adapted to dusty work and rough usage as the common rotary motion where there is less friction, and where a little inaccuracy from wearing is of less consequence.

There are several machines for crushing Gorse; and though this has always been found a difficult operation, the progress of mechanical art has now furnished the farmer with a means of converting an unprofitable encumbrance into valuable cattle food. Messrs. Barrett, Exall, and Andrewes' Gorse Machine, which obtained the prize at both York and Norwich Shows, is certainly one of the best. Knives diagonally placed upon a cylinder in front of the box cut the Furze, which is then squeezed between rollers underneath. It is adapted both for horse and steam-power.

Among CAKE-BREAKERS, we observed Hornsby's Double Cake-crusher, with its two pairs of rollers toothed with pinnacle points; Wedlake's, with cam rollers, &c., &c., a great variety, the merits of which are to be found by trial.

Almost all the greater makers exhibit specimens of corn and seed BRUISERS, some in which the grain is broken between plain cylinders, in others between fluted rollers. Stanley, of Peterborough, Garrett, Wedlake, &c., are great in this department. Bean-splitters and Portable Flour-mills offer also considerable variety; and machines of this kind, for preparing food for stock, seem now to be indispensable to even the plainest farmer. Stanley exhibits a very neat and convenient arrangement of Barn machinery, in which a Chaff-cutter, Cake-breaker, Turnip-cutter, and Bruiser are all turned from one shaft by a two-horse portable oscillating steam-engine.

One instrument in our barns and granaries that seems to need improvement is the Weighing-machine; and the farmer will notice with pleasure the Balance Sack-weighing-machine of J. James and Co., Whitechapel, London. This is very neat and concise, and will weigh sacks and bags, without the inconvenience of heavy half-hundred weights. The cast-steel measures for corn, &c., of H. A. Thompson, Lewes, Sussex, appear calculated to supersede the old wooden bushels, pecks, &c. *I. A. C.*

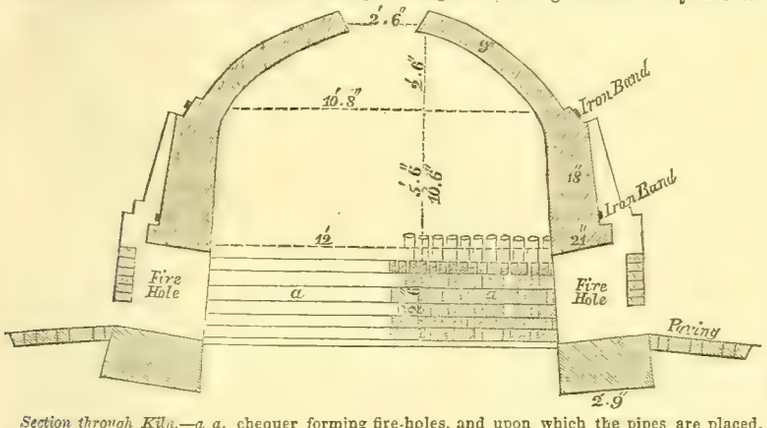
## ON THE CULTIVATION OF HEMP.

HEMP requires for its growth a soil of deep, rich, moist alluvium, such as is found in the best parts of Lincolnshire, where the ingredients of the earth are numerous, finely comminuted, and very intimately mixed. It will thrive on friable loams, and on loamy sands, provided the culture be rich, and the manuring abundant. On the latter soils the produce is not so abundant as on black rich moulds, but the quality is finer, and can be used for more valuable purposes. The land must be very perfectly cleaned and heavily manured, or made very rich by the previous cropping. If freshly manured, the quantity may be 16 to 20 loads of dung on an acre. On this rich and pulverised surface, two bushels of Hemp seed are sown by the hand in broadcast, during the two first weeks of the month of April, and covered by a light and gentle harrowing. The heaviest and brightest coloured seed should be selected, and some of them should be cracked to see if they have the germ perfect. Birds must be scared from the sown ground till the plants appear. It has been practised to hoe the crop, setting the plants at 12 to 16 inches apart, cutting down all weeds, and repeating the hoeing at the distance of a month or six weeks; but when the culture of the land is proper, the plants very soon cover the ground and kill every weed.

In about four months after sowing, the plants of Hemp turn yellow in the leaves, and the stalks become white, when the crop is ready to be pulled. When thread only is intended, without any regard to the seed, the whole produce is pulled at once; when ripened seed is grown, the male plants are first pulled, usually in August, and the female ones afterwards, in the beginning of October, when the seeds are seen to be ripe. In both ways the stems are tied in bundles of about a yard in diameter, and with a rope at each end. The crop is then conveyed to the steep of water, in order to undergo the operation of water-retting. The bundles are placed in rows crossing each other, and are kept under water by blocks and logs of wood. It soaks generally four to ten days, if the weather be warm; if not, five or six more, till the outside coat easily rubs off. It is then spread out singly on Grass, and turned, if there be showers, thrice a week; if not, twice a week. This is called Grassing, and requires five or six weeks. It is then tied up in large bundles, and carted to a barn or house for breaking, by a machine called a "brake;" this is either done directly, or the bundles are laid up to dry for the future purpose. The Hemp being beat and broken by the hand or mill, is dressed or combed, by being drawn through hickles or heckles, resembling wool-combers' tools, only fixed. The Hemp that is broken off by the operation is called "shorts;" this is bound up by itself, and is about the value of the long Hemp. The offal is called Hemp sheaves, and makes good fuel. Sometimes the Hemp is dressed to one quality of fineness, or it is made into two or three sorts, as the demand of purchase may direct. The heckler sells the Hemp to be spun for thread, or himself applies it to that purpose. Being converted into yarn, it is sent to the "whitester," who returns it in a bleached condition.

The female plants of Hemp produce the ripened seeds, and for that purpose remain longer on the ground. The pulled bundles of tied stems are stacked up or housed till the seed be threshed out. In the spring (January or February) the stems are spread upon Grass, and if the season suits, particularly if covered with snow, it will come a good colour, and make a strong coarse cloth; but it is much inferior to Hemp pulled in proper time, and water-retted or steeped. Although Hemp, in the process of manufacturing, passes through the hands of the breaker, heckler, spinner, whitester, weaver, and bleacher, yet many of these operations are frequently carried on by the same person. Some weavers bleach their own yarn and cloth; others their cloth only. Some heckle their tow and put it out to spinning; others buy the tow and put it out; and some carry on the whole of the trade themselves. When the trade is conducted by different persons, their interests often clash. By under-retting the Hemp, the grower increases the weight; by slightly beating it, the heckler increases the quantity of tow, but leaves it fuller of bark; by drawing out the thread beyond the staple, the spinner increases the quantity of yarn, but injures the quality; by forcing the bleaching, the whitester increases his profit, but diminishes the strength of the yarn. In general, in manufacturing cloth, strength is sacrificed to fineness and colour.

The average produce of an acre of Hemp may be estimated at 40 stones, or 16*l.* in money. The expense per acre may be about 10*l.*, leaving 6*l.* for clear profit, along with the value of two to three quarters of ripened seed (about 4*l.*), when the crop is raised in that way. Even this average statement requires good land and rich culture. *J. D.*



## KILNS FOR BURNING DRAIN-PIPES AND TILES.

IN building a kiln for burning draining-pipes and tiles, although economy of fuel may be of the first, yet there are other things of nearly equal, importance; among these we may mention cost of erection, economy in filling and removing the goods, and the applicability of the kilns for carrying on the works with the regularity and despatch that can only be ensured by division of labour, which in well-conducted works is known to be the secret of success, and in which the large always has the advantage of the small manufacturer. The men employed by the one acquire skill by constant practice; the other loses much by being obliged to call the attention of his men to different descriptions of work. Another desideratum (which a correspondent has lately inquired for) is a kiln in which drain-pipes and tiles can be burnt without its being nearly half filled with bricks. The kiln which appears most applicable for the purpose is that now in use in many of the best-arranged tile-yards, and which has been introduced from Staffordshire, where, of course, everything relating to the manufacture of pottery, the coarser descriptions of which are near akin to the pipes and tiles of the farmer, has had the test of a lengthened experience of its use, and therefore it can be more confidently recommended to the notice of the pipe and tile maker. It possesses many of the advantages mentioned above, and it is used in works where only draining-pipes and tiles are made, although it is capable of burning bricks as well as other ware. In constructing the kiln, a circle is first described upon the ground for the foundations, which are dug out with the bottom sloping towards the centre, to enable the dome to be turned with greater facility and strength. But we need hardly describe the process of building, as the annexed section will amply show how the bricklayer should proceed in his work.

The bricks forming the chequer or bottom of the kiln, and upon which the pipes are placed, may either be permanent and constructed of fire-bricks, or it may be put in with green bricks each time of burning. In the section, these bricks are shown with vacancies left to distribute the heat equally throughout the kiln. It will be understood that the fire-holes which run from the walls to the centre are formed by these means, and that upon the top of the chequer the pipes are placed in a vertical position; the large pipes are of course filled in with those of smaller dimensions, both to economise space and to prevent the fire drawing through them too rapidly.

The cost of a kiln of the dimensions given, taking the materials at a reasonable price, will not exceed 30*l.*, and this should include bricks, lime, labour, and iron bands; but it will be exclusive of the fire-bricks required to form a permanent bottom or chequer.

We need hardly remark, that in the introduction of a new kind of kiln, such as the one described, among brick and tile-makers who cannot be expected at once to fall in with, or see the merits of, a thing which they perceive for the first time in their lives, or to which they have not been accustomed, it is perhaps the most advisable plan to procure a respectable man who has had experience in its working; and with his assistance business is more likely to go on smoothly than amongst strangers.

*Section through Kiln.—a a*, chequer forming fire-holes, and upon which the pipes are placed. There should be 10 fire holes running from the outside to the centre of the kiln, and openings for this purpose are left through the wall in building the kiln; these should be 10 inches wide on the outside, decreasing to 6 inches in the inside of the wall. It is advisable that the fire-holes should be built with fire-bricks.

## Home Correspondence.

*Do Labourers need Strong Drink?*—In your number of the 7th, is a communication from "Falcon," on the prevalence of drunkenness and drinking habits, more especially among the labouring classes, and stating that "there surely must be some means of checking the prevalence of tippling." No doubt there is a means at once simple, economical, and effectual, and that is, not to drink intoxicating liquors at all. Every other means, as far as society at large is concerned, has failed, and will continue to fail, and the only wonder is, that any sensible or observant individual, viewing the weakness and sensuality of human nature on the one hand, and the insidiously tempting nature of alcoholic liquors on the other, should expect anything but failure. If then, the continuance of manufacturing and using these drinks, is to subject us to the fearful evils to which "Falcon" has briefly alluded, but which it would be all but impossible adequately to describe, it becomes a matter of no trifling interest, to enquire how far such articles are necessary for carrying on the operations of agriculture, for which purpose they are still considered essential by many of those who are engaged in farming. Considering how heavily the evils arising out of our drinking customs fall upon the farmer, in the shape of poor and county rates, accidents to men and horses, abused or neglected cattle, slighted labour, and grumbling labourers, &c., I have been surprized that the subject has not been more often alluded to in the columns of the *Gazette*, not so much in a moral, as in an economical point of view, for surely these are times in which no means of improving the moral and physical condition of the employed, or of lessening the inconveniences and cost of cultivation to the employer, ought to be neglected. Permit me then to state to such of your readers as need the information, that it is now proved, by long and extensive experience, that the most arduous labour, either at the workshop or the field, can be performed not only as well, but better on the average, without intoxicating drinks than with them; indeed, I presume very few but ignorant or ill-informed persons will venture to question the truth of this statement. With these important facts before us, viz., that intoxicating drinks are not necessary to persons in health, whatever their occupation, that the use of them leads to an indescribable amount of misery and crime, for which the farmer has largely to pay, it may well occupy a few pages of the *Gazette*, to discuss the propriety of continuing the custom, as a mere matter of £ *s. d.* The enlightened Christian philanthropist need not hesitate long in pronouncing a judgment upon the wisdom or the humanity of destroying every year millions of bushels of wholesome food, to deluge the country with needless temptations, under which thousands continue to fall, and all this to gratify one sensual appetite, which in the long-run rather lessens than increases the intellectual and social enjoyments of life. *S. Bowly, Gloucester*; 16*th*, 6*mo.*, 1851.

*Land Drainage Companies.*—In the leading article of your paper, published on Saturday last, you alluded to the General Land Drainage and Improvement Company, and amongst other sensible remarks referring to the difficulty and expence attendant on the borrowing of the Government money for drainage purposes, you state, in reply to the letter of your correspondent signed "A Tenant for Life," that if the existing Drainage Companies can relieve land-owners from the trouble, risk, and uncertainty of obtaining funds for the improvement of their estates, "this information would be of quite as much practical value as a detail of the expenses incidental to a Government loan." As a Director of the General Land Drainage and Improvement Company, I am enabled to assure you that such is the object of our Company. Under the powers of our Act of Parliament we are not only enabled to advance money for draining, but we also have power granted to us to erect such farm buildings as may be required to meet the present improved system of husbandry, a power which is enjoyed by no other Company, and to which the Government loans do not extend. We have entered into contracts, and are about to commence operations, in making roads, in draining, and in erecting new farm offices, and also in improving old buildings, and I feel convinced, when the existence of our Company, and the powers which have been granted to it by Act of Parliament, become more generally known, that landowners will eagerly take advantage of the saving of trouble and expence, which is thus held out to them, instead of being satisfied with the hold-hard policy suggested by the "Tenant for Life." Any information respecting the expenses to be incurred in employing the Company, may be obtained of the Secretary, at the office, No. 52, Parliament-street, London. It is a sad, but no less undoubted fact, that a large portion of the drainage which has been done in this country, has been carried out so badly, that the land had to be drained a second time. The object of the General Land Drainage and Improvement Company, is to provide an efficient staff of drainers, &c., to whom the landowners may look for the proper execution of such works, instead of the ignorant bailiff or village drainer; although in cases where the landowner himself understands the work to be done, or has a steward or bailiff capable of carrying it out, we are ready to leave the execution to the landowner or his agent, subject only to the Company's supervision, the plans being furnished by the Company. The whole subject of good draining and the improvement of land having become more than ever so important and national a question, I make no apology for thus troubling you. *John Villiers Shelley, Maresfield Park, Sussex, June* 18.

*The Value of an Acre of Roots.*—"F." advocates sowing Turnips in squares rather than drills; this is reverting to broadcast under another name. The great advantage of rows over broadcast or squares consists, I think, in admitting a less obstructed passage of air, and on this freedom from stagnation perhaps depends the growth of plants more than is suspected. Certainly, if a plant depended for its food solely on what it could draw by its roots from the soil, it would appear more reasonable that it should be placed so as to draw this food most equally all around it; but it is not so, and I believe the same number of plants, moderately proximate in wide rows, would give a return fully equal to the same number of plants in squares; I need not say that the rows would afford greater facilities for working the ground. I have myself, experimentally, and also without any ulterior views, Potatoes both in drills and in squares on both a small and a large scale for many years, and found no advantage in the squares over the rows; and indeed, under peculiar tillage, I have found drills yield much heavier crops than I ever got from squares. The growth of the roots is promoted by every thing that gives a previous encouragement to the development of the leaves. *J. M. Goodiff, Granard.*

*American Churn.* — On looking over the "Notices to Correspondents" in your Paper, 14th June, we find your corespondent "M. J. R.," wishes to have a candid opinion of the American Churn. Although we are the agents for the proprietors, yet we hope you will excuse our troubling you with copies of a few letters recently received from disinterested parties who have had the churn in use for some time, in addition to which we have just received a note from Lord Camoys, in which he states, as follows:—"I have had one of your churns in use for some time and it answers perfectly;" we could also show you numerous other testimonials in its favour, but these being recent ones, we think them more satisfactory, we shall be happy at any time to show you the originals of these letters, or if your correspondent should be visiting London we shall be happy to show them to him, or if he will supply us with some cream we shall be happy to show him the churn in operation. *Burgess and Key*, 103, *Newgate-street, London.* "About a year ago I purchased of you one of Anthony's Double Acting American churns; my small dairy was then managed by a very obstinate servant, who hated novelties, and you are well aware that I was at first much disappointed with it; but I have now great pleasure, after some experience of the merits of the churn, in adding my testimony to its great value. Instead of my servant being put out of temper as heretofore by turning the old-fashioned barrel churn from half an hour at least to sometimes an hour and a half, and being surprised with bad butter as the result of all her labour, I now can depend upon obtaining the first-rate butter in 10 or 12 minutes. *Charles Margetts, Huntingdon, April* 14." "On reading the letter of your Huntingdon correspondent, I began to think I was similarly situated in regard to a dairy-maid, so I sent to a friend (who was anxious about it) the churn; he managed to make it answer as regards time and the excellence of the butter, this acted as a stimulus to my dairy-maid, and since its return I have succeeded in the same way, and have much pleasure in bearing testimony to its merits. *Anne Allen, Wenggwnd Glen, near Llangollen, 3d May*, 1851."—We have also received the following:—A correspondent enquires, now that the American churn mania is over, that some one will perhaps give an account of its merits.—The merits of this churn are in a nut-shell; as a churn for amateur dairymen, it will answer remarkably well up to 6 lbs., but there its merits end. To that size it can be depended on to produce butter in from 10 to 15 minutes, but there is no advantage of quantity or quality over 'Baker's,' or any other loose churn, and, in fine, it is extravagant. In large sizes it is useless. I have tried it carefully, and in fact, was most desirous to find a good working churn to supersede the old barrel, which I have used for 20 years. I took much pains to arrive at such a conclusion; but, after many repeated trials, was compelled to return to the old one. I cannot account for the mania in any other way than by supposing that the manner in which it was brought out had something to do with the mania, for, on its own merits, it cannot rest. It has obtained a prize or two, but really we old hands begin to think little of these rewards of merit. *An Essex Farmer.*

*Village Industrial Club.*—On Friday last, June 13th, the first meeting of a Village Industrial Club was held at Eydon, in the county of Northampton. The object of this Club is to promote habits of industry in the cultivation of land, skill in handiwork, personal and household cleanliness, and good moral conduct among the inhabitants. At this meeting was exhibited, in the school-rooms, a show of flowers, vegetables, needle-work, and works of ingenuity, which far surpassed the most sanguine expectation of the promoters of the Club. The manner in which the room was decorated with flags and wreaths of flowers (the willing gifts of the inhabitants), displayed great skill and considerable taste. The anticipation of pleasure and benefit from the establishment of the Club is so great, that the inhabitants appeared to be animated with but one spirit of endeavouring to do all they could to celebrate the first meeting. In the Club, which is only just formed, there are already 150 members: these have free entry to the show, and other persons pay 6*d.* or 2*d.*, according to their station; and although the morning was not propitious, 2*l.* 15*s.* 0½*d.* were taken at the doors. One hundred and twelve articles were exhibited, and 39 prizes given. The money value of the prizes is very small, but with each is given a particularly neatly printed card, with an appropriate device. Of needle-work, the marked feature was patch-worked quilts, made by the school children, which, for arrangement of colours and device of pattern, excited general admiration. Among the articles of ingenuity were three tables, a towel-horse, and doll's bedstead and furniture, made by a boy. A band of music attended, and the farmers and principal inhabitants subscribed to give tea and cake to all the women and children, and bread and cheese and a pint of beer to the men, of which more than 450 partook. In the evening the whole party, with several of the neighbouring gentry and farmers, joined in the dance. At 10 o'clock "God Save the Queen," and "Rule Britannia," was sung, and the party broke up, having spent a day that all classes felt has done much to strengthen the feeling of good fellowship and unity among them. *Wm. Griffin, Eydon, Daventry.*

*Pork.*— I am in the habit of fatting pigs for London, and I have been accustomed to use Barley-meal, but the price of Barley having advanced, I have been induced to use Lentils; but am uncertain how this food will act with the pork as to colour. Can any one give this information? *A. B.*

*Land Drainage Companies.*—Having noticed some observations in the *Gazette*, in reference to the supposed difficulties and expense attendant on borrowing money of Government under the general Drainage Act by tenants for life, I can bear testimony to the attention of the Inclosure Commissioners to applications, and to the economy of their proceedings. Having undertaken for a friend to superintend the drainage of a farm of which he was tenant for life, and finding individuals indisposed to lend money for the purpose, involving repayment by periodical instalments, I was, after some misgivings from past proceedings in Government offices, induced to apply for a Treasury loan through the Inclosure Commissioners in the course of last winter. The drainage has been effected, certified by their surveyor, and the amount of the certificate paid over by the Treasury, and the total charge on the part of the commissioners was rather under 3 per cent. upon the outlay, which included the

cost of the advertisements required by the Act, and which are inserted by the commissioners. The difficulty which has been observed upon in the *Gazette*, as to the first advance of the money for the execution of the works as they proceed, surely is not very formidable under ordinary circumstances. Before this is commenced the loan by Government will have been agreed to; any banker in the neighbourhood who knows the circumstances, and has any confidence in the party, will make the necessary advances for paying the workmen during the progress of the work, to be repaid with interest when the loan is paid over from the Treasury. *C. Laurence.*

*Game.*—I rejoice that so intelligent a correspondent of the *Agricultural Gazette* as Mr. Cuthill should have deemed my challenge to defend Game from the obloquy cast upon it, to be worth his accepting; as I consider that from his experience, observations, and prudence, he is well qualified to defend and support any views he may undertake to advocate. I shall, however, require much indulgence, both from him and others, who may take an interest in this very important subject; for the task I have assigned myself of defending what is generally condemned, is not a very grateful one: but I hope, nevertheless, to eradicate some of the prejudice existing against game and game-preservers, and I trust also to make some proselytes to my own opinions. I observe, however, that I shall keep my mind open to conviction, and be more anxious to acknowledge that my own views are erroneous, than to gain a triumph over my competitor. But first, and *in limine*, I wish it always to be borne in mind, that in my challenge I studiously and carefully used the word "Game," meaning thereby game in the aggregate, and not any one or more kinds of it. With these preliminary remarks, I proceed to Mr. Cuthill's six questions as they appear in the *Agricultural Gazette* of May 30. 1. "Who does he," Mr. Wilkins, "consider is the master on the farm where game is preserved?" I answer this question by putting a parallel one; namely, when a master of foxhounds covenants with a tenant to keep for him breeding-hound bitches and their puppies, or brood-mares and their foals, who does Mr. Cuthill consider is master on the farm whereon those bitch-hounds and puppies, and mares and foals are kept? 2 and 3. "How much does a hare or rabbit cost the landlord? How much the tenant?" These questions embrace so many circumstances and casualties, that a volume would be required in which to enumerate them; but I will endeavour to give a brief reply to them, by again asking a counter question. The proprietor of a farm says to an applicant for it to rent, "Sir, I preserve the game on my estate, and on this account I have fixed the rent of the farm at 450*l.* a year, otherwise it would have been 500*l.*" "Very well," replies the applicant, "grant me a lease on those terms, and I will sign it and become your tenant." Now, should the landlord get annually 50 hares and rabbits only from that farm, each one would cost him just 20*s.*, besides the expenses of preserving: and were 25 only obtained by the landlord, then, in that case, each one would cost him 2*l.* But what would the 50 or 25 hares and rabbits cost the tenant? Perhaps 50 pence or 25 pence, or say, 50*s.* or 2*l.* 10*s.*; but this would be a very high sum indeed. 4. "How is it that when a large landed proprietor takes to farming himself, he always does away with his preserves?" Were this the case, it would certainly tell somewhat against my argument, but my experience has shown to me that just the reverse has been the truth. For example, at this time I am personally acquainted with several game preservers, and every one of them farms, and some of them extensively; and I believe this to be the rule with most preservers, and the other to be the exception to it. 5. "What effect on the county-rates, if the Game Laws were abolished?" I reply to this question by again asking one or two more; namely, what effect upon the county-rates were the laws abolished for the preservation of poultry, or fruit? For I, myself, can perceive but little or no difference between these cases, except that to steal hares, and rabbits, and partridges, and pheasants, is called poaching, whilst to rob fowl-houses and orchards is called thieving. But in my opinion there is but little difference between the crimes, except that the poacher is the most desperate character, as he generally pursues his vocation in the dead of the night, armed like a bandit, with murderous weapons, whilst the other but seldom commits violence. Were I, therefore, to advocate the abolition of the laws for the protection of one kind of property, I would also abolish the laws for the protection of the other kind. But I am also asked, "Would it not be better for landlords to let each of his tenants preserve his own game, and do away with that most noxious person, the keeper, who is the cause of all bitter strife between landlord and the tenant?" My decided opinion is, that it would not be better, but a great deal worse, were landlords not to preserve game by means of keepers; nor do I believe that game-keepers are the cause of all bitter strife between landlords and tenants. It is true, and quite possible, that tenants may not like a keeper, or that the keeper may be litigious or overbearing to the tenants; but the same rule applies also to stewards. But if stewards and keepers be necessary or useful, as I maintain they are, this is no reason why they should be dispensed with, and especially if it be proved, as I expect it will, that game is beneficial to the tenants, and consequently that it must be preserved, and by keepers also, or made by law into private property; but that it never can be. Having so far replied to my worthy adversary's questions, I close the subject for the present, reserving what I have to say in defence of game itself for subsequent discussion. I wish, however, to thank Mr. Cuthill for the kind spirit in which his letter is written, and to observe, that even now I think our opinions are not far from coinciding, and that I do not fear but ultimately they will meet and coalesce entirely. I draw this conclusion from the enlightened sentiment at the conclusion of his letter, that "a farmer would not totally destroy winged game, as they are his best friends, living upon his enemies;" or he might have said, that a single brood of partridges do more real service to the farmer, by destroying wire-worms and other insect pests on his land, than a score or two of rabbits or hares do injury. *Geo. Wilkins.*

## Societies.

### ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A WEEKLY COUNCIL was held at the Society's House, in Hanover-square, on Wednesday, the 18th of June, the Hon. ROBERT HENRY CLIVE, M.P., Trustee, in the chair; when Professor WAY, the Consulting Chemist of the Society, delivered a Lecture on the—

AGRICULTURAL EMPLOYMENT OF GYPSUM.

Professor Way commenced his lecture by stating the chemical composition of Gypsum, or Plaster of Paris. He described it as a Hydrated Sulphate of Lime, consisting of—

| | | | |
|---|---|---|---|
| Lime ... ... ... | 32·5 | Or as composed, in general terms, of about .. .. | 1 Lime. |
| Sulphuric acid ... | 46 5 | | 1 Sulphuric acid. |
| Water ... ... ... | 21 0 | | 1-5 Water. |
| | 100·0 | | |

It occurred in the older transition rocks, in the secondary strata (especially in the new red sandstone), and in the tertiaries above the chalk: for instance, in the London and Paris beds, the Oxford clay, the red marl in Cheshire above the salt beds, and generally in the counties of Cumberland, Stafford, Derby, and Nottingham; in the state of alabaster, and also in the form of lance-headed crystals, as selenite. The colour of natural gypsum varied according to its impregnation with iron and other substances. He submitted to the members some specimens from Normandy, Nottingham, and Derbyshire, which had that morning been received, in which this variety of colour was shown. Gypsum was soluble in 461 times its weight of water. When heated to 272 degrees, its water was driven off, and the gypsum lost about one-fifth of its weight; it could then be easily reduced to a fine powder, and became the well-known substance, "plaster of Paris," so extensively used in plastic operations; the powder on being wetted assuming a compact mass, having the shape of the vessel or mould into which it was poured. Professor Way supposed this binding effect to be the mechanical result of the interlacing of the crystals formed during the operation of the water on the plaster of Paris. If heated too strongly, however, as, for instance, much beyond the common heat of a baker's oven, it would not set afterwards on the admixture with water. He thought there might perhaps, prove to be an advantage in this result when gypsum was required for application to the soil, as it would no longer have binding properties. He then performed a very simple and striking experiment to show how easily gypsum could be recognised when held in solution by water. He filled two tumbler-glasses with water impregnated with gypsum: into one of these he poured a solution of oxalate of ammonia, which immediately gave a copious white precipitate showing the presence of *lime;* into the other he poured a solution of muriate of barytes, which also gave a copious white precipitate, indicating, however, in this case, the presence of *sulphuric acid.* The two tests thus establishing, by their combined evidence, the existence of sulphate of lime, or gypsum, in the water under examination. Professor Way remarked, that nothing could be more easy than for any person to discover by this simple means whether water contained gypsum; and the question was an important one, for he thought he was pretty safe in saying that gypsum would do no further good to land in which it already existed. In order to ascertain whether such was the case, the farmer had only to digest some of the soil in cold water, filter the liquid through blotting paper, and then add to two separate portions of it a little oxalate of ammonia and muriate of barytes, as just shown. Gypsum, when broken down into powder, might be drilled in with the seed, or used (as was more generally the case) as a top-dressing in the spring. In America gypsum had been applied with great success to all crops; but in England, while it had been found valuable to Clover, Italian Rye-grass, Sainfoin, Lucerne, and to leguminous plants and artificial Grasses generally, it had not proved beneficial in the same degree to the Grasses of natural pastures. The action of gypsum on vegetation was very capricious and often fallacious: although occasionally useful, like common salt, it was sometimes successful and at other times not so. These apparently inconsistent results had arisen from want of care in noting the precise circumstances in each case of the application of this manure. To one of these cases he had just made reference, namely, to that of gypsum being already present in the soil, as on the new red sandstone and Oxford clay formations, and therefore not further required by crops growing on such land. Failure might also be due to the want of sufficient moisture, or to the absence of any other necessary ingredient in the soil. When the land was in good condition to produce crops, then gypsum might be applied under favourable circumstances. Prof. Way then proceeded to discuss the theory of the action of gypsum. If it in certain cases proved of service, in what manner, it might be asked, was this beneficial result produced? what had been the mode of action in character and circumstance? Was the lime, the sulphuric acid, or both—or sulphur alone—the cause? He would first refer to its direct, and then to its indirect action on vegetation. Sir Humphry Davy had found, in the course of his researches into the relation between plants and soils, that there existed more gypsum in Clover and Sainfoin than in other plants which he examined; and he therefore drew the conclusion that gypsum, as a whole, namely, as a combination of sulphuric acid and lime, acted merely as an essential food of plants.

"In examining the ashes of Sainfoin, Clover, and Rye-grass, I found that they afforded considerable quantities of gypsum; and this substance, probably, is intimately combined as a necessary part of their woody fibre. If this be allowed, it is easy to explain the reason why it operates in such small quantities; for the whole of a Clover-crop, or Sainfoin-crop, on an acre, according to my estimation, would afford by incineration only three or four bushels of gypsum."—*Sir H. Davy's Seventh Lecture.*

In none of the experiments made by Sir H. Davy did gypsum appear to increase the putrefaction of animal matter, or the decomposition of manures. He found the Berkshire and Wiltshire peat-ashes contain a large portion of this substance: the Newbury peat-ashes contained from one-fourth to one-third; the Stockbridge peat-ashes a larger proportion. He had, however, examined many peat-ashes in which gypsum was found. In general, when fresh peat, on being acted on by vinegar, emitted a smell of Harrowgate water, he thought it might be inferred that it would furnish gypsum. Baron von Liebig considers that the sulphuric acid of gypsum becomes decomposed in the course of the vegetative process of plants, and that its sulphur is the element which is given off to leguminous seeds and corn crops generally.

"Thus we are enabled to explain the use of common salt as a manure; it enables the plants for which this manure is useful to extract its sulphur from the soil in which it existed in the form of sulphate of lime."

"Gypsum, or sulphate of lime, is the most generally diffused sulphate. Being soluble, it may either pass directly into the plant, or it may be decomposed by the carbonate of ammonia existing in rain water, when its sulphur will pass into the plant in the form of ammonia."—*Liebig's Agr. Chem.*, 4 *ed.*, (*chapter* vi.)

M. Boussingault regards lime as the valuable component part of gypsum, and considers gypsum to be of no value where there is an abundant supply of carbonate of lime.

"In conclusion, we perceive that it may fairly be assumed, that gypsum acts beneficially on artificial meadows, by carrying lime into the soil: that, at least, is the opinion which seems best to accord with agricultural facts, and with the results obtained by analysis from the ashes of crops; I may even add, that best accords also with results obtained from the analysis of arable soils; for it may be inferred, from a series of researches made by M. Rigaud de l'Isle, that gypsum acts only on those soil's which do not contain a sufficient amount of lime in the state of carbonate."—*Boussingault: Economie Rurale*, 1814 (*Chap.* vi)

Liebig ascribes to gypsum the power of solidifying the ammoniacal vapours floating in the atmosphere, and of giving to nitrogen or ammonia a fixed condition in the soil.

"The evident influence of gypsum upon the growth of Grasses, the striking fertility and luxuriance of a meadow upon which it is strewed, depends in some degree upon its fixing in the soil the ammonia of the atmosphere, which would otherwise be volatilised with the water which evaporates. The carbonate of ammonia contained in rain-water is decomposed by gypsum in precisely the same manner as in the manufacture of sal-ammoniac. Soluble sulphate of ammonia and carbonate of lime are formed; and this salt of ammonia, possessing no volatility, is consequently retained in the soil. All the gypsum gradually disappears; but its action upon the carbonate of ammonia continues as long as a trace of it exists." "The action of gypsum, chloride of calcium, and of other salts of lime, really consists in their giving a fixed condition to the nitrogen or ammonia introduced into the soil. This nitrogen is indispensable for the nutrition of plants."—*Liebig's Agr. Chem.* (*Chap.* v.)

Boussingault opposes this view of the question propounded by Liebig. The carbonate of ammonia would decompose the gypsum when in solution, and carbonate of lime and sulphate of ammonia would be the result; a fixed ammoniacal salt being thus obtained in lieu of the volatile one. This double decomposition would not take place under circumstances of such mere dampness as that in which soil generally existed; it required the presence of water in a greater amount, and in a less diffused state. Boussingault therefore inferred that gypsum could have no effect in decomposing the carbonate of ammonia of the atmosphere in the ordinary state of the soil. If ammonia, too, is valuable to all plants, and particularly to the Wheat crop, why, he asks, does not gypsum act beneficially on all crops, by this absorption of ammonia which Liebig assumes to take place? Professor Way then ventured to state his own objections to the theories of these three distinguished chemists. Sir Humphrey Davy's philosophical mind led him to deduce sound conclusions from the facts as they stood before him; but the analysis of plants at that time was very imperfect, and had, since the publication of his lectures, been carried on more extensively; and it was now known that many other plants contain quite as much gypsum as Saintfoin and the artificial Grasses, without being benefited by its application during their growth. M. Liebig's theory was open to the objection, that although gypsum may no doubt furnish sulphur to plants, soils possess the power of fixing ammonia without gypsum being present. M. Boussingault was met with the fact that more lime was found in many other crops than in those of artificial Grasses; for instance, that a crop of Carrots takes from the soil nearly four times as much lime as Clover hay does, six times as much as Saintfoin hay, and fourteen times as much as Italian Rye-grass; and Professor Way thought it might therefore reasonably be asked why gypsum, as a source of lime, is not a good manure for Turnips and Carrots? It was unfortunate that the state of science on these points was as yet so imperfect. He thought we should go much straighter to the mark in such cases

by confessing our ignorance than by attempting to construct theories founded on insufficient data. Professor Way then referred to the use of gypsum in stables. Liebig had recommended it to be strewn on the floors of stables, for the purpose of removing the smell and arresting the ammonia, which he supposed will thus be carried out with the manure. This effect had been denied. Professor Way conceived that the failure might be due to an amount of water being present, only sufficient to absorb the volatile carbonate of ammonia, which was again given up to the atmosphere on the gypsum's becoming dry, but not sufficient to lead to its conversion by double decomposition into the fixed sulphate of ammonia. He would recommend, in preference to the use of gypsum in these cases, diluted sulphuric acid put in boxes and troughs in different parts of the stables. Gypsum was often put into liquid manure tanks, to prevent the escape of the volatile alkali. It would answer if the gypsum was frequently well-stirred up from the bottom of the tank, to which it fell on account of its slow solubility. He would recommend the gypsum to be put into a basket of good size, to be placed under the spout by which the liquid manure was brought unto the tank : this would save the trouble of stirring. Green copperas and sulphuric acid were better for liquid manure in tanks or wells, but gypsum was cheaper. In the filtration of liquids, however, through the gypsum, it should be remembered that the ammonia was not arrested and retained in the basket, but passed off through it ; as the sulphate of ammonia formed was soluble, though not like the original carbonate of ammonia, volatile.

Professor Way having concluded his lecture, expressed his willingness to answer any question in his power connected with the scientific principles of the subject, their practical elucidation being better understood by the members present. In reply to inquiries by Dr. Calvert, he stated that there was no difference between burnt and unburnt gypsum as an absorbent ; but that gypsum in a dry state could not absorb ammonia. It was part of the duty in some union houses for the inmates to break this stone for agricultural use. Burning made it easier to pound, but by thus rendering it a cementitious powder it was more liable to cake when used. This was prevented by mixing the powder first with dry soil.—Colonel le Couteur had been much struck some years ago with the remarks of Sir H. Davy on the component parts of the Clover plant ; and having land in Jersey, on coming into his estate, on which it had been impossible ever to grow Clover, he caused an analysis of the soil to be made for him by Prof. Bachhoffner, who found that it had not a particle of lime in its composition. Having thus a clear insight into the cause of the failure, he lost no time in dressing his land with nine bushels of lime to the acre, putting it in heaps about the field, and covering them with earth. This application had so completely altered the character of the soil that he had not only himself the finest crops of Clover anywhere to be seen, but his neighbours had also followed his example with the same success. He thought this fact, as one of a particular case, strengthened the theory of M. Boussingault, that it was as lime, and not as sulphate of lime, that gypsum acted beneficially on crops of this nature.—Colonel Challoner inquired whether our own analyses of the ashes of plants agreed with those on which Boussingault rested his conjectures ; and he was answered by Prof. Way that there was no essential difference between them. Colonel Challoner then proceeded to remark that it was desirable to know whether, in making peat ashes, the peat should be only charred or burnt at a red-heat. He believed failures in the use of gypsum chiefly to arise from applying it in dry weather, when there was not a drop of rain. He had always applied it either early in the morning, when a heavy dew is on the ground, or when rain was likely soon to fall. He had himself been a successful Carrot-grower in this part of the country, and he would next year try the effect of gypsum on that root-crop. As his land did not contain a particle of lime, gypsum might probably have a good effect. He had to that time been obliged to get lime by means of soap-ashes.— Lord Ashburton suggested that Colonel Challoner should vary his experiment, to ascertain whether the lime or the sulphuric acid in gypsum was the efficient agent ; namely, by dividing his trial-field into three portions, leaving the circumstances the same in each, excepting in the application of gypsum to the first, simple lime to the second, and sulphuric-acid and bones to the third.—Colonel Challoner always manured his Carrots by a previous crop ; as they never did so well by direct manuring, which made them clubby. He found it answers well never to have a horse on the ground after sowing. He employed a hand-drill, by Holmes, of Norwich, by means of which a man sowed the seeds in the sand ; the plants were straightened, by a boy, with the back of a common rake. By adopting this system, his Carrots speared, or started, a fortnight or three weeks earlier than formerly. It was desirable, however, that the white Belgian Carrot-seed should be of the same date ; for if a mixture of old and new seed was employed, the spearing would occur at different times. Messrs. Thomas Gibbs and Co. had much aided him in this object by their attention to his wishes on this point.—Professor Way thought an excess of gypsum injurious. He stated that Mr. Hamond had been desirous that his tenants in Nottinghamshire should subsoil the land on the Norfolk system ; but they strongly objected to bring up the subsoil to the surface, as their experience had taught them that great damage invariably resulted in their case from such a process. Mr. Hamond being desirous of ascertaining the cause of this injury, sent to Professor Way a specimen of this subsoil, which on analysis was found to contain half its weight of gypsum. This no doubt had destroyed the crops. Hard water, he believed, was known to be unfavourable to some plants, and the water passing through this dressing of subsoil washed the gypsum out of it, and thus became very hard water from such impregnation.—Dr. Calvert wished to know the quantity of gypsum that might with safety be applied to land ? —Prof. Way thought that one per cent. in soil would do no harm ; and to produce that proportion to the depth of five inches, five tons of gypsum per acre would be required : a limit within which our ordinary applications were safely included.—The Hon. R. H. Clive, M.P., remarked that although guano had answered, in his own case as in that of others, most completely, it must not be forgotten how essential was the old lime-system, which of late years had been discarded ; if we went on much longer with strong animal manuring, we should begin to feel the bad effects of not reverting to that wholesome and excellent application.—Mr. Thompson (President of the Agricultural Association of Upper Canada), who had favoured the Council with his attendance on that occasion, referred to the practice followed in the United States in the employment of gypsum. When used alone to the land, it was found not to produce good crops. It was most successfully applied to the Clover, in which it occasioned a strong growth, and improved the succeeding Wheat crop. It was also extensively employed in the cultivation of Indian Corn, but the land required to be brought into good heart by some previous application. Good crops were grown in sandy soils, but manure was required in addition to the gypsum. In America they never thought of burning the gypsum, but erected mills which ground it as fine as the finest Wheat-flour. It was important in the agricultural employment of this substance, that it should be thus finely ground ; the difference in the results obtained from coarse-ground and fine-ground gypsum was most striking. It occurred not far from a place of his own residence and other parts of Canada, as well as at Oswego, Rochester, and other localities in the United States.—Colonel Challoner thought that a means of improvement in the soil by the ploughing-in of green crops was in this country too much neglected. In Southern Italy, near Naples, Lupin crops were grown extensively for this purpose ; and the difference in the appearance of the land where this fresh manuring had taken place was so great, as to be distinctly seen at a great distance. He considered the subject well worthy of the attention of our farmers.—Mr. Thompson remarked that it had not been found beneficial in Canada to apply gypsum to the Wheat crop directly, but that there was a district of deep sandy loam in his part of the country, on which it had been the practice of the occupier for the last 20 years to grow a Wheat crop every alternate year. In the autumn he sows Wheat ; in spring, 3 lbs. of Clover seed to the acre ; harvests the Wheat and grazes the Clover : in the following spring sows gypsum over the Clover, and when in good growth turns stock upon it, from the middle of June to the 1st of July ; then ploughs up : and so on, obtaining a crop of Wheat every alternate year, without any falling off in its amount on quality. —Mr. Bateham, of Columbus, in the United States (Editor of the Ohio *Cultivator*), at present also on a visit to England, has favoured the Council with the following statement of similar results connected with judicious cropping under favourable circumstances :—

"*Soil for Wheat in America.*—In the State of Ohio one of the central states, latitude 39° to 41°, we have tracts of remarkably fertile land—deep alluvion, along the borders of streams and rivers, called by the inhabitants bottom-lands, say from 1 to 3 miles in breadth, and mostly level. These lands are famous for growing Indian Corn (Maize) ; but where the soil consists of a good portion of sand and lime pebbles, as well as dark vegetable matter, these lands are used for Wheat (as along the Miami river), and in some cases Wheat has been grown successfully every other year for 10, or even 15 to 20 years in succession, without any apparent decrease of fertility. I can furnish statements from individual farmers on my return if desired. The crop raised alternately with Wheat on these lands is commonly Indian Corn, but sometimes Oats or common Red Clover. When the Wheat is sown after Corn, the Corn is cut up and put into stooks or shocks to ripen, and the ground once ploughed and sown in September with Wheat. Oats are sown (after Wheat crop) in March or April, and harvested in July ; the ground immediately ploughed, and left till 1st September, then ploughed again, and sown to Wheat ; but this rotation is not approved by good farmers. Clover (red) is everywhere with us regarded as the best alternate with Wheat, only it is found a rather wasteful practice to plough it in the next year after sowing. Clover is sown on the Wheat in winter, or early in spring ; then pastured after Wheat harvest, and again the next spring and summer, or cut for hay in June, then ploughed in late in August or September, and sown to Wheat. On ordinary soils three to four crops are allowed to intervene between crops of Wheat."

The Chairman having informed Professor Way that the thanks of the Council had been unanimously voted to him for his kindness in giving them so valuable a Lecture on that occasion, expressed his satisfaction at the interesting practical statements with which the meeting had been favoured, and his acknowledgments to the respective individuals by whom they had been made, the Council adjourned to their next weekly meeting, on Wednesday, the 25th of June.

## Reviews.

*Remarks on Fumigating Horticultural and Agricultural Crops.* Published at the Office of the *Gardeners' Chronicle and Agricultural Gazette*, 5, Upper Wellington-street, Strand.

THIS pamphlet describes a machine for fumigating plants either in a confined or in an open place.

"Although it is not pretended that blight, or *aphis*, can be totally destroyed in the open air by means of smoke, without some covering to keep it for a time in contact with the vermin, still the insect will be so paralysed as to render it unable to prey upon the young crop ; and if the plant can be grown into rough leaf, it is beyond the danger of its ravages. Every agriculturist will appreciate the means of effecting this, and of securing his Turnip-crop, the foundation of profitable farming. It may now certainly be done ; and the fly prevented, paralysed, or extirpated, by going repeatedly over a field, or a Hop-garden, for a few days ; indeed, if the operation is commenced so soon as the young plants come through the ground, and fruit trees and shrubs fumigated before the enemy appears, it will prevent their approach ; and the prudent cultivator should always fumigate in anticipation, mindful of the sage maxim of the philosopher,

'Venienti occurrite morbo.'*

"These implements, whether large or small, are also available for combusting scented woods, and for fumigating and disinfecting impure places in houses or ships ; also for extirpating vermin from dwellings, barns, and corn-stacks. In furtherance of this latter object a prepared powder may be obtained of the vendors of the instrument, called 'Brown's Fumigating Powder,' which, being mixed, according to direction, with some combustible substance, evolves an acrid vapour, extremely nauseous, and intolerable to snakes, lizards, and the reptile tribe, as well as rats, mice, cockroaches, black beetles, bugs, &c., &c. The Fumigator may also be used for suffocating bees, wasps, or ants."

The machine has been advertised repeatedly in our columns; and though we have no personal experience of its merits, we do not object to say that the inventor appears to have received a number of trustworthy certificates of its efficacy.

## Miscellaneous.

*Kilns.*—Joseph Christian Davidson, of Yalding, Kent, Brickmaker, for improvement in lime and other kilns and furnaces. Patent dated November 2d, 1850. "1. Mr. Davidson's improvements have relation to lime kilns, in which, as usually constructed, the fire has been lighted in the kiln underneath an arch built of the limestone to be calcined. According to this method a great waste ensues from pieces of the stone chipping off by the action of the heat and falling into the fire, from which they have necessarily to be removed. It is now proposed to have the fire-place alongside of the kiln, and to conduct the flame and products of combustion through the side of the kiln, to act upon the limestone, which is to be piled in the kiln on an arch built in the usual manner, and so as to act as a reticulated flue. 2. The same principle is applied to the kilns used for baking bricks, the fire-places being arranged at the side of the kiln, in such position as to make the openings in the walls thereof the throats of the furnaces." *From the Mechanics' Magazine of May* 10

METEOROLOGICAL REPORT.—JUNE.

* A storm coming from the Azores, and passing away to the northward.

† This storm came from the south, travelling nearly due north, having its central line to the westward, over the Irish channel probably; or perhaps even to the west of Ireland. Although in London it produced no visible result, being limited to a most intense degree of suffocating heat, in Cheshire and Lancashire it burst in a most tremendous hurricane of thunder and lightning. This extreme heat is easily explained, as are also the fluctuations of the barometer and veerings of the wind, if we move a storm-card from south to north over the Irish channel, and bear in mind that this atmospheric body was coming from the heated regions of Africa to our latitude.

Dorchester, June 26th. *F. P. B. M.*

(*To be continued.*)

## Notices to Correspondents.

BRAILLE'S PROCESS FOR GRINDING CORN: *G S W* asks for information on this subject. It was lately spoken of in the *Times* newspaper. Where is it to be heard of, or seen?

CHURNS: *Sub.* Tin may be used safely, as the material of which they are made. Wooden churns are generally preferred.

IMITATION WOOD: *W J.* Can any one give our correspondent any information as to the method of preparing imitation wood from the leaves of the coffee chicory? [The thing shall be referred to in detail under "Wood."]

LIQUID MANURE: *Ammonia.* If you dilute it sufficiently with water, it will not annoy your neighbour when you spread it over the land; or you may try oil of vitriol, which will convert the volatile carbonate of ammonia, to which the smell is owing, into the fixed and inodorous sulphate.

SALT: *J P* may sow 2 cwt. of salt broadcast on his Mangold Wurzel plants per acre.

SHELL MANURE: *R T Gardener.* Will any one give us his experience of the pulverised shell manure as advertised?

# Markets.

## COVENT GARDEN, JUNE 28.

Trade is steady, and the market well supplied with all kinds of Fruit and Vegetables in season. Forced Peaches and Nectarines continue to be sent in unusually large quantities. English Pines and Hothouse Grapes are plentiful and good. Strawberries from the open ground are now in good demand, and the supply is well kept up. Cherries are cheaper. West Indian Pines fetch from 2s to 5s. each. Oranges and Lemons are plentiful. Nuts remain nearly the same as quoted last week. Asparagus, young Carrots, French Beans, and Green Peas are received in quantity. Frame Potatoes may be obtained at 2d. to 4d. per lb. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1s. 3d. per pottle. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis floribunda, Cinerarias, Pinks, Moss and Provins Roses.

### FRUIT.

Pine-apples, per lb., 5s to 8s
Grapes, hothouse, p. lb., 3s to 7s
Peaches, per doz., 10s to 20s
Nectarines, per doz., 10s to 20s
Cherries, per lb., 1s to 5s
Melons, each, 4s to 8s
Strawberries, p. pottle, 6d to 1s
Gooseberries, per half sieve, 2s to 3s
Currants, per hf. sieve, 3s to 4s
Almonds, per peck, 6s
— sweet, per lb., 2s to 3s
Lemons, per doz., 1s to 2s
Oranges, per doz., 9d to 2s
— per 100, 6s to 14s
— Seville, p. 100, 7s to 14s
— — p. doz., 1s to 2s 6d
Nuts, Barcelona, p. bsh, 20s to 22s
— Brazil, p, bsh., 12s to 14s
Cobs, per 100 lbs., 50s to 55s

### VEGETABLES.

Cabbages, per doz., 6d to 1s
Greens, per doz. bunchs., 6d to 1s 6d
Cauliflowers, p. doz., 2s to 4s
French Beans, p. 100, 1s 6d to 2s 6d
Beans, p. hf. sieve, 1s 6d to 2s 6d
Peas, per sieve, 2s 6d to 3s 6d
Asparagus, per 100, 1s to 4s
Rhubarb, p. bundl., 2d to 6d
Potatoes, per ton, 90s to 200
— per cwt., 4s to 8s
— per bush., 1s 6d to 3s
Turnips, p. bunch, 6d to 1s
Cucumbers, each, 3d to 1s
Radishes, per doz., 6d to 9d
— Turnip, p. doz., 8d to 1s
Celery, p. bundle, 6d to 2s
Carrots, per bunch, 6d to 1s
Spinach, per sieve, 9d to 1s
Onions, p. bunch, 2d to 4d
Leeks, per bunch, 3d to 4d
Shallots, per bunch, 3d to 4d
Garlic, per lb., 4d to 8d
Artichokes, per doz., 1s 6d to 2s 6d
Lettuce, Cab., p. score, 4d to 9d
— Cos, per score, 3d to 1s
Small Salads, p. punn., 2d to 3d
Horse Radish, p. bundl., 1s 6d to 6s
Red Beet, per doz., 6d to 1s 6d
Mushrooms, p. pot., 8d to 1s
Sorrel, per hf. sieve, 6d to 9d
Fennel, per bunch, 2d to 3d
Savory, per bunch, 2d to 3d
Thyme, per bunch, 2d to 3d
Parsley, per doz. bun., 2s to 3s
— Roots, p. bundl. 9d to 1s
Mint, green, per bunch, 4d to 6d
Basil, green, p. bunch, 6d to 9d
Marjoram, green, do., 6d to 9d
Watercress, p. 12 bunch., 6d to 9d
Corn Salad, p. hf. sieve, 1s to 1s 6d

### HOPS.—FRIDAY, June 27.

Messrs. Pattenden and Smith report that the market for Hops is still on the advance, and that the accounts from the plantations generally speak of an increase of vermin and honey dew.

### POTATOES.—SOUTHWARK, June 23.

The Committee report that there have been no arrivals since our last report, nor are any more expected this season; there is no improvement in prices this week; the few old Potatoes left salesmen are anxious to get rid of at any figure. In closing our report for the season we are happy to say at present the crops are looking well.

### HAY.—Per Load of 36 Trusses.

**CUMBERLAND MARKET, June 26.**

| | | | | | |
|---|---|---|---|---|---|

### COAL MARKET.—FRIDAY, June 27.

Carr's Hartley, 14s; Eden Main, 13s. 3d.; Wallsend Braddyll's, 14s. 9d.; Wallsend Stewarts, 14s. 6d.; Wallsend Adelaide Tees, 13s. 3d.—Ships at market, 86.

### SMITHFIELD, MONDAY, June 23.

The number of Beasts was smaller, so also was the demand. Consequently we were unable to alter our quotations, although there was a small advance on a few choice ones. The supply of Sheep was considerably larger than the demand, and they could not be disposed of, although the prices were lower. There was an inquiry for choice Lambs, but middling ones, which were plentiful, made very little money. Trade was heavy for Calves at lower rates. From Holland and Germany there are 330 Beasts, 2660 Sheep, 296 Calves, and 11 Pigs; from France, 36 Beasts and 30 Pigs; from Scotland, 240 Beasts; from Norfolk and Suffolk, 1800; and 270 Sheep from Spain.

| Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|
| Best Scots, Herefords, &c. | 3 | 4 | to 3 | 6 |
| Best Short-horns | 3 | 0 | — 3 | 4 |
| 2d quality Beasts | 2 | 4 | — 2 | 10 |
| Best Downs and Half-breds | ... 3 | 8 | — 3 | 10 |
| Ditto Shorn | ... | ... | | |

| Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|
| Best Long-wools | 3 | 2 | to 3 | |
| Ditto Shorn | ... | | ... | |
| Ewes & 2d quality | 2 | 8 | — 3 | 2 |
| Ditto Shorn | ... | | ... | |
| Lambs ... | ... 4 | 6 | — 5 | 4 |
| Calves ... | ... 2 | 6 | — 3 | 6 |
| Pigs ... | ... 2 | 6 | — 3 | 4 |

Beasts, 3518; Sheep and Lambs, 33,080; Calves, 441; Pigs, 335.

FRIDAY, June 27.

The number of Beasts is again small, but there is an unusually scanty attendance of buyers, consequently many remain unsold, and 3s. 4d. is an extreme quotation for choicest kinds. Sheep and Lambs are again plentiful; it is difficult to maintain Monday's rates for the former, and the latter are fully 1d. per 8 lbs. lower. We have an extraordinary supply of Calves, and a slow trade; the choicest are 2d. per 8 lbs. lower, and there is a considerable reduction in inferior kinds. From Germany and Holland we have 103 Beasts, 900 Sheep, 330 Calves, and 20 Pigs; from Spain, 140 Sheep; from Scotland, 68 Beasts; 400 from Norfolk and Suffolk; and 68 milch cows from the home counties.

| Best Scots, Herefords, &c. | ... 3 | 2 | to 3 | 4 |
|---|---|---|---|---|
| Best Short-horns | 3 | 10 | — 3 | 2 |
| 2d quality Beasts | 2 | 2 | — 2 | 8 |
| Best Downs and Half-breds | ... 3 | 8 | — 3 | 10 |
| Ditto Shorn | ... | ... | | |

| Best Long-wools | 3 | 2 | — 3 | 6 |
|---|---|---|---|---|
| Ditto Shorn | ... | | ... | |

| Lambs ... | ... 4 | 0 | — 5 | 0 |
| Calves ... | ... 2 | 0 | — 3 | 4 |
| Pigs ... | ... 2 | 4 | — 3 | 4 |

Beasts, 714; Sheep and Lambs, 14,480; Calves, 784; Pigs, 420.

### MARK LANE.

MONDAY, JUNE 23.—The market was shortly supplied with English Wheat this morning, and a further advance of 1s. per qr. was readily obtained. Notwithstanding a large arrival of foreign Wheat, a steady demand was experienced, at a similar improvement in value. There was no alteration in the nominal price of town-made Flour, but country and best French brands were 1s. per sack dearer.—Barley of home growth scarce, and fully as dear.—The receipts of foreign Oats this week are large, several vessels having arrived. Really good sweet horse corn could not be purchased any cheaper than last week.—Beans and Peas firm, at the recent improvement in value.

| PER IMPERIAL QUARTER. | s. | s. | | s. | s. |

FRIDAY, JUNE 27.—The arrivals of English corn since Monday have been moderate, but we are well supplied with foreign. The attendance at market was small, and we observe no alteration in the value of English Wheat, and as foreign was generally held for late prices the business transacted was confined to needy buyers. Spring corn of all descriptions is very firm at Monday's quotations. The prices of Flour are maintained, but the sale is inanimate. In f. o. b. cargoes of Wheat business has been less lively; with the exception of one, all southern cargoes arrived on the coast are disposed of.

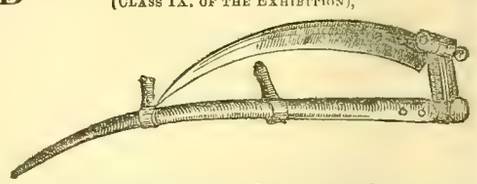
LIVERPOOL, TUESDAY, JUNE 24.—At this day's market there was a fair attendance of the town and country trade, who showed some disposition to purchase, but the high prices asked checked business, and only a moderate retail sale was experienced for Wheat and Flour at Friday's prices, being an advance on the week of 1d. to 2d. per 70 lbs. on the former, and 6d. per barrel and 1s. per sack on the latter article. Oats and Oatmeal being scarce, commanded an advance of 1d. per 45 lbs. and 1s. per load. Barley, Beans, and Peas were without alteration in value. Indian Corn met with little inquiry. ——FRIDAY, JUNE 20.—There was scarcely so much briskness in the Corn Market this morning as we have experienced every day this week, still there was a good demand for Wheat and Flour from the interior, and there was an improvement on Tuesday's prices of 1d. to 2d. per bushel on Wheat, 6d. per barrel on American, and 1s. per sack on French Flour. Oats also advanced 1d. per bushel, and Oatmeal 1s. per sack, and both very scarce. Beans and Peas were held for higher rates. Indian Corn was also in good favour, but not any dearer.

FARM AND COTTAGE PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.



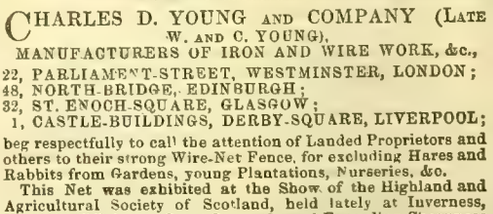
Patent Pump ... ... £1 16 0
Patent Pump, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing ... ... ... 2 12 0
Larger sizes if required.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers.

JOHN WARNER & SONS, 8, Crescent, Jewin-street, London.

Every description of Machinery for Raising Water, Fire Engines, &c. The usual allowance to the Trade.

BOYD'S SELF-ADJUSTING SCYTHE, (CLASS IX. OF THE EXHIBITION),



Can be put together and regulated to any angle by any person in one minute, without the assistance of a blacksmith; shuts up like a knife, and can be carried without danger. It effects a saving of 25 per cent. in labour, and can be used in an upright position if necessary. Manufactured and sold by DEANE, DRAY, and DEANE, Agricultural Implement Depot, Swan-lane, London Bridge; and to be had of all respectable Ironmongers.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c.,

22, PARLIAMENT-STREET, WESTMINSTER, LONDON;
48, NORTH-BRIDGE, EDINBURGH;
32, ST. ENOCH-SQUARE, GLASGOW;
1, CASTLE-BUILDINGS, DERBY-SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30*s.* ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

| | | |
|---|---|---|
| Or a web of 100 yards, 18 ins. wide, will cost | ... | £3 15 0 |
| Do. of 100 yards, 24 ins. wide | ... ... | 5 0 0 |
| Do. of 100 yards, 30 ins. wide | ... ... | 6 5 0 |
| Do. of 100 yards, 36 ins. wide | ... ... | 7 10 0 |

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has in many instances been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. YOUNG and Co cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2¼ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. YOUNG and Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

ORCHIDS.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King-street, Covent Garden, on THURSDAY next, at 12 for 1 o'clock, a Case of ORCHIDS, just received overland from Sylhet, consisting of Aerides, Vandas, and Dendrobiums of many species, some of which are evidently new; to which will be added some lots of Cattleyas and Oncidium papilio from South America, fine specimens.—May be viewed on the morning of sale, and Catalogues had.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

TO BE LET (from year to year), subject to Tithe Rent Charge, to be entered upon on the 11th of October next, a desirable FARM, called the Manor Farm, in the parish of Swavesay, in the county of Cambridge (a Railway passing through the said parish), comprising a good Residence with all requisite Agricultural Buildings, and about 510 a 2 r. 1 p. of Arable and Pasture Land, as now occupied by Henry Wiles, whose tenancy will expire at the above time.—For leave to view, apply to the Tenant, and for further particulars to Mr. RANDALL, Solicitor, Cambridge; or to ROBERT EMSON, Esq., Camden-place, Cambridge.

HOUSE, GREENHOUSE, VINERY, &c. &c.
TOLLINGTON-PARK, HORNSEY-ROAD.

TO BE LET, or the Lease (15½ years unexpired) to be Sold, a Convenient, 10-roomed House, pleasantly situate, in one of the most healthy and delightful neighbourhoods near London. The House is in perfect repair, and the garden laid out in tasteful style, well stocked with a choice collection of Roses, and other flowers. Greenhouse filled with a variety of plants and approved Grape Vines in the most healthy state. Omnibus every five minutes from the Bank, Charing-cross, and Oxford-street.—For particulars, apply by letter, to Z., Messrs. Mudie and Sons, Coventry-street, Piccadilly, or viewed any day from 10 to 6 o'clock; 19, Tollington Park.

ROYAL AGRICULTURAL COLLEGE,
CIRENCESTER.

Patron—His Royal Highness PRINCE ALBERT.
President—The Right Hon. Earl BATHURST.
Vice-President—The Right Hon. Earl DUCIE.

The COLLEGE will RE-OPEN, after the summer vacation, on Monday, August 11, for agricultural and general education. Lectures by Professors of ability and experience, in Chemistry, Geology, Botany, Zoology, Veterinary Medicine, and Surgery, Surveying, and Civil Engineering, &c., are combined with practical instruction in agriculture, and the several branches of a good education. Agricultural Analysis will be undertaken in the Laboratory of the College, at a low rate of charges.—For prospectuses and information respecting the Course of Studies, Terms, &c., for in and out Students, apply to the Principal, the Rev. J. S. HAYGARTH, M.A.

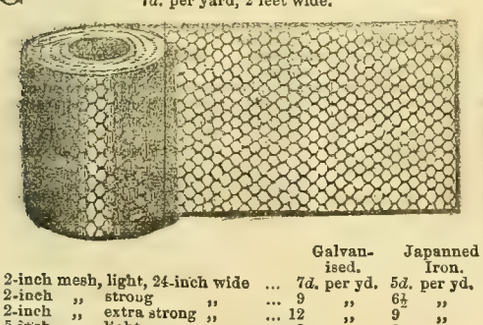
ROYAL AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.—The ANNUAL MEETING and GREAT NATIONAL CATTLE SHOW of this Society will take place this year in Dublin, at the Royal Dublin Society's Premises, Kildare-street, on WEDNESDAY, AUGUST 13TH, and the days following, on which occasion ONE THOUSAND POUNDS and upwards, including the Challenge Cup and Medals of the Society, will be offered in premiums for Cattle, Horses, Sheep, Swine, Poultry, Dairy Produce, Flax, and Agricultural Implements, the particulars of which, together with Prize Sheets and blank forms of Entry, can be had on application to the Secretary.

Monday, the 21st of July, will be the last day for lodging notices of Entry for the Show, after which day none can be received.

All implements must be in the Show Yard on or before Monday, the 11th of August, as the Judges will commence their inspection on Tuesday morning early.

All Stock and other articles, except Horses, must be in the Show Yard before 6 o'clock on Tuesday, the 12th of August, when the gates will be closed.

Arrangements are in progress for the conveyance of Stock and Implements, duly entered for Exhibition, by Steam Boats and Railways, to the Show, the particulars of which shall be communicated on application.



Signed by Order, EDWARD BULLEN, Secretary.
Society's Rooms, 41, Upper Sackville-street, Dublin.

HAYMAKING SEASON.—Look to your HAYMAKING MACHINES, that they are fit for use beforehand. Apply early for WEDLAKE'S, Original Patentee, still manufactured in a very superior manner for durability. Delivered free, at reduced charge, to meet the times' price.

MARY WEDLAKE, Widow, 118, Fenchurch-street, City, London, only maker.

REPEAL OF CORN LAWS.
HOW TO MAKE HAY AT ANY TIME, AND IN ANY COUNTRY, AT HALF THE USUAL COST. A Tract for the Times. Price One Shilling. Forwarded free upon receiving 12 postage stamps.—Address to MARY WEDLAKE, 118, Fenchurch-street, City, London.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

| | | Galvanised. | Japanned Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24-inch wide | ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch " strong " | ... | 9 " | 6½ " |
| 2-inch " extra strong " | ... | 12 " | 9 " |
| 1½-inch " light " | ... | 8 " | 6 " |
| 1½-inch " strong " | ... | 10 " | 8 " |
| 1⅓-inch " extra strong " | ... | 14 " | 11 " |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

## Popular Works

# DARLEY'S SCIENTIFIC LIBRARY

FOR THE USE OF

SCHOOLS, PRIVATE STUDENTS, ARTISTS, AND MECHANICS.

IT is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics, these little works will be particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind and brief for the memory, and the Elements of each Science are reduced not only to their simplest but to their shortest form.

I.

A NEW EDITION (being the fifth) *is now ready.*

## A SYSTEM OF POPULAR GEOMETRY.

Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading truths and great principles.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

II.

NEW EDITION (just published),

## COMPANION TO THE POPULAR GEOMETRY.

In which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of life, with numerous Cuts.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

III.

THIRD EDITION,

## A SYSTEM OF POPULAR ALGEBRA;

WITH

**A Section on PROPORTIONS and PROGRESSIONS.**

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*

"For Students who only seek this limited knowledge of these sciences, there are, perhaps, no treatises which can be read with more advantage than 'Darley's Popular Geometry and Algebra.'"—*Library of Useful Knowledge, article "Mechanics."*

IV.

SECOND EDITION.

## A SYSTEM OF POPULAR TRIGONOMETRY,

**Both Plane and Spherical:**

With POPULAR TREATISES on LOGARITHMS, and the Application of Algebra to Geometry.

BY GEORGE DARLEY, A.B.

Price 3*s.* 6*d.*, cloth.

THE GREAT EXHIBITION.—A valuable, newly-invented, very small powerful WAISTCOAT-POCKET GLASS, the size of a Walnut, to discern minute objects at a distance of from four to five miles, which is found to be invaluable at the Exhibition, and to Sportsmen, Gentlemen, and Gamekeepers. Price 20*s.*, sent free.

TELESCOPES.—A new and most important Invention in Telescopes, possessing such extraordinary powers, that some, 3½ inches, with an extra eye-piece, will show distinctly Jupiter's moon, Saturn's ring, and the double stars. They supersede every other kind, and are of all sizes for the waistcoat pocket, Shooting, Military purposes, &c. Opera and Race-course Glasses, with wonderful powers; a minute object can be clearly seen from 10 to 12 miles distant.

Invaluable newly-invented preserving SPECTACLES, invisible and all kinds of acoustic Instruments for relief of extreme deafness.

Messrs. S. and B. SOLOMONS, Opticians and Aurists, 39, Albemarle street, Piccadilly, opposite the York Hotel.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abetnaw Lime, and Roman Cement. Fine Black, 25*l.* per ton, and Rich Purple-brown, 20*l.* per ton.—Offices of the Company, 1, New Broad-st., London.—JOHN A. WEST, Secretary.

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—The Public is respectfully informed, that these favourite Ales may be had genuine, in casks of 18 gallons and upwards, at their respective stores, as under, where also a list of the bottles may be obtained.

The Brewery, Burton-on-Trent; Stores, 61, King William-street, City, London; Cook-street, Liverpool; High-street, Birmingham; The Exchange, Manchester; and 33, Virginia-street, Glasgow.

ZOOLOGICAL GARDENS, REGENT'S PARK.—The URAN UTAN, presented by the Governor of Singapore, is exhibited daily from 12 to 6 o'clock, together with the ELEPHANT CALF, and the HIPPOPOTAMUS, presented by His Highness the Viceroy of Egypt. The Band of the First Life Guards will perform, by permission of Colonel Hall, at 4 o'clock, on every Saturday, until further notice. Admission 1*s.* ON MONDAYS 6*d.*

METCALFE AND Co's NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co's, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

THE LADIES' FRIEND.

ROWLAND'S AQUA D'ORO.—This is the most fragrant and refreshing Perfume ever yielded by the "Souls of Flowers." It retains its fresh and delightful odoriferous [illegible]. It is invigorating, gently stimulating, yet sedative; and is an unrivalled quintessential spirituous product. For fainting fits, fatigues of dancing, oppressions from over-crowded rooms, or intense summer heat, its uses cannot be over-estimated. Price 3*s.* 6*d.* per bottle.

N.B.—A Golden Fountain of the AQUA D'ORO is exhibited at the Crystal Palace.

ROWLANDS' MACASSAR OIL,
for creating and sustaining
A LUXURIANT HEAD OF HAIR.

ROWLANDS' KALYDOR,
FOR RENDERING THE SKIN SOFT, FAIR, AND BLOOMING,
and
ROWLANDS' ODONTO,
OR PEARL DENTRIFICE,
FOR IMPARTING A PEARL-LIKE WHITENESS TO THE TEETH.

The Patronage of Royalty throughout Europe, and the high appreciation by rank and fashion, with the well known infallible efficacy of these articles, give them a celebrity unparalleled.

BEWARE OF SPURIOUS IMITATIONS.

The only genuine of each bears the name of "ROWLANDS'" preceding that of the Article on the Wrapper or Label.

Sold by A. ROWLAND and SONS, 20, Hatton-garden, London, and by respectable Chemists and Perfumers.

HOLLOWAY'S PILLS A MOST EFFICIENT REMEDY FOR BILIOUS COMPLAINTS AND INDIGESTION.—A Captain, in the mercantile service, who had traded many years to the West Indies, suffered for a considerable time from severe Bilious attacks and Indigestion depression of spirits bordering on melancholy, a sinking at the pit of the stomach, and a continual craving after substantial food. He paid an immense sum of money for medical advice, without obtaining any lasting benefit; and, however extraordinary it may appear, he was cured in less than six weeks by taking HOLLOWAY'S Pills, and for the last two years he has not felt the least symptom of Bile, Indigestion, or disordered stomach.—Sold by all Druggists; and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

THE BLOOD.—Our bodies have been entirely formed, *are now forming, and will continue to be built up during life from the blood. What the sap is to the tree the blood is to the animal frame: and inasmuch as the strength and verdure of a tree are dependant on the moisture derived from the root, the health and vigour of the body are indispensably connected with a pure and free circulation of this important fluid. It is this that must feed the flame of existence; and unless its replenishments are freely and purely communicated, the vital fire becomes clouded, burns dimly, and is ultimately extinguished. The grand object is to keep this precious fluid (the blood) in a pure and healthy state, for without this purity, disease will show itself in some way or other.*

PARR'S LIFE PILLS.

*It is universally admitted that this medicine will purify the blood better than any other, and will conquer any disease.*

None are genuine unless the words "PARR'S LIFE PILLS" are in WHITE LETTERS on a RED GROUND, on the Government stamp, pasted round each box; also the fac-simile of the signature of the Proprietors, "T. ROBERTS and Co., Crane-court, Fleet-street, London," on the directions.—Sold in boxes at 1*s.* 1½*d.*, 2*s.* 9*d.*, and family packets at 11*s.* each, by all respectable medicine vendors throughout the world.

SCOTTISH GARDENERS AND LAND-STEWARDS' ASSOCIATION.—At the Annual General Meeting of the Association, held on the 28th ult., ARCHIBALD SCOTT, Esq., in the Chair, it was resolved, that THREE PENSIONERS be placed on the roll at the ensuing Election—that the time for applicants to send in their claims be extended to 1st August ensuing, and that the Election take place on the 28th of the same month.

CHARLES LAWSON, junior, Hon. Sec.

*** Forms of application for Candidates may be obtained of the Secretary, 1, George IV. Bridge, Edinburgh; of Mr. THOMSON, Secretary to the Glasgow Board, Trongate, Glasgow; and of Mr. SOMMERS, Secretary to the London Board, 159, Fenchurch-street, London.

EXHIBITION OF AMERICAN PLANTS—ROYAL BOTANIC GARDENS, REGENT'S PARK.

JOHN WATERER (the principal Contributor to the above Exhibition), begs to say that his unrivalled Collection is still in full bloom, and may be seen gratis by Orders from Fellows of the Society.—The American Nursery, Bagshot, Surrey, June 28.

ROSES.
WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WM. WOOD AND SON respectfully announce to their Friends and the public that the Collection of ROSES at Woodlands will be in fine bloom about the first week in July, and will continue flowering during the Rose season.

W. W. and Son here think it necessary to state, in justice to themselves, that their stock this season far surpasses in quantity (by many thousands), the display of former years. For the convenience of visitors, a raised platform has been erected, from which parties will be enabled to compass at one view a quarter of 10 acres covered with Roses in full bloom, presenting a *coup d'œil* perhaps never before witnessed in one garden.

Maresfield is situated 12 miles from Hayward's Heath, a station of the London and Brighton Railway, from whence conveyances to the Nursery may be obtained. Parties leaving London by an early train would reach Lewes in time for the 12 o'clock coach, which runs daily to Ringles Cross Gate, about two miles from the Nursery.

Woodlands Nursery, July 5.

ROSE NURSERIES, HERTFORD.

E. P. FRANCIS'S extensive Collection of ROSES is now in full bloom.

E. P. F. begs to refer purchasers of strong dwarf-stemmed Roses in pots, to his list advertised in the two last Saturdays' *Chronicle*.

ROSES.

EDWARD DENYER, NURSERYMAN, Loughborough Road, Brixton, 3 miles from London, informs his kind patrons in general that his unrivalled collection of Roses reaching to nearly 1000 varieties, is now in bloom, and free to the inspection of all visitors, Sundays excepted. Orders taken at this time, and executed in November next. Fruit and Ornamental Trees, &c., may also be seen in great varieties.

E. D. informs his friends that he has no Seed Shop in London.

NEW AND CHEAP PLANTS SENT OUT THIS SPRING.

HENRY WALTON begs to inform his patrons and the public that he has printed descriptive lists of FUCHSIAS, VERBENAS, PETUNIAS, MIMULUS, CHRYSANTHEMUMS, &c., which he is prepared to offer at very low prices.

Lists may be had on application, enclosing a postage stamp, to Mr. WALTON, Edgend Marsden, near Burnley, Lancashire.

CHOICE CINERARIA SEEDS, saved from the newest and best varieties, at 1*s.* 6*d.*, 2*s.* 6*d.*, and 5*s.* per packet, post free, on receipt of stamps for the amount.

PLANTS OF CABBAGE, SAVOY, KALE, BROCCOLI, CAULIFLOWER, AND CELERY.

JOHN CATTELL, NURSERYMAN AND SEEDSMAN, Westerham, Kent, begs respectfully to inform the public that Plants of his superior true sorts of the above are now ready, and will be forwarded, as usual, to order, on receipt of postage stamps or Post-office order, made payable here, at the under-named prices, basket or mat, and package included.

All the sorts of Early Cabbage, Savoy and Kale, including Brussels Sprouts, 4*s.* 6*d.* per 1000; all the sorts of Autumn and Spring Broccoli, 5*s.* 6*d.* per 1000; all the sorts of Celery, 5*s.* 6*d.* per 1000; Cauliflower, Early and Late, and Red Cabbage, 9*d.* per 100; Drumhead, or Cattle Cabbage, 3*s.* 6*d.* per 1000. 6*d.* per 1000 less, when no mat or package is required. Packages of 1000 and upwards delivered free of carriage to the Edenbridge Station of the South-Eastern Railway. A Circular, containing the sorts of the above, may be had on application, by enclosing a penny stamp.

Seed of CATTELL'S Dwarf Barnes, and of his superior Dwarf Reliance Cabbage, may be had in packets, by post, for 12 penny stamps per packet, the former containing 1 oz. as usual, and the latter ¼ z.

ROSES.—The Collection at Sawbridgeworth is now in FULL BLOOM, and will continue in perfection for some time. The Harlow Station of the Eastern Counties Railway is the most convenient to the Nursery.

THOMAS RIVERS.

BEDFORD NURSERY, ACRE LANE, BRIXTON.

W. J. SANGSTER, Successor to Mr. J. CONNOLLY, begs to inform the Nobility, Gentry, and the Trade, that he has taken the above Nursery, and hopes, by strict attention to his business, he will be favoured with their orders as before.

W. J. S. has to offer to the Trade a fine seedling GERANIUM, one of the best and earliest in cultivation.—A portion may be seen in bloom at the Nursery.

STRAWBERRIES AND FRUIT TREES.—TANNED GARDEN NETTING, for protecting the above from birds, or as a fence for fowls, pigeons, Tulip and seed beds, from JOHN KING FARLOW'S fishing tackle and net manufactory, 5, Crooked-lane, London-bridge, at 1½*d.* one yard, 3*d.* two yards, or 6*d* four yards wide. Forwarded, carriage free, on all orders over 20*s.*, accompanied with post-office order or stamps.

STRAWBERRIES.—The late heavy rains abundantly prove the necessity for some secure method of preserving this delicious fruit from grit and dirt; and as no plan has been discovered so effectual as ROBERTS'S STRAWBERRY TILES, he begs to acquaint the public that they are to be had only at his WAREHOUSE, No. 34, EASTCHEAP, CITY, LONDON. The sustained and increasing demand for these Tiles, and his other Horticultural appliances, has induced the Advertiser to take premises purposely to manufacture them, by which means he is enabled to reduce the price 25 per cent. A Pamphlet, new edition, with directions and illustrations, can be had by enclosing six postage stamps to the above address.

TO THE ADMIRERS OF THAT SPLENDID AUTUMNAL FLOWER, THE CHRYSANTHEMUM.

YOUELL AND CO. are now prepared to execute orders from their extensive and very select collection of the above, comprising all the new and fine continental varieties, at the following prices:—

| | | | | |
|---|---|---|---|---|
| 50 best new sorts | ... | ... | 25*s.* |
| 25 | ditto | ... | ... | ... | 15*s.* |
| 12 | ditto | ... | ... | ... | 9*s.* |

Well established in small pots, or by post free.

NEW DWARF CHINESE OR LILLIPUTIENNE CHRYSANTHEMUMS.

This new and beautiful class is well deserving the attention of cultivators, from their exceeding dwarf habit (not attaining more than 1 foot in height). The profusion of flowers with which they are covered, as well as the great variety and distinctness of colour, will render them general favourites. Strong plants for autumn blooming are now ready for sending out at the following prices:—

9 fine varieties, sent out in 1849 ... ... ... ... 5*s.*
13 ditto raised by M. Lebois, and sent out for the first time last season ... ... ... ... ... 12*s.*
30 extra fine ditto, quite new, of this year, and selected by us when in bloom, 3*s* 6*d.* each, 6 for 18*s.*, 15 for 37*s.* 6*d.*, or the set of 30 varieties ... ... ... ... 60*s*

The above are perfect gems. Engravings of the same may be seen at the Nursery.

Descriptive Catalogues of the above may be had on application. Printed directions of their successful and easy method of cultivating the Chrysanthemum for exhibition, &c., will be forwarded with all orders.

"GLOXINIA PETOIANA."

We have the greatest satisfaction in calling attention to the above magnificent Gloxinia, raised at the seat of Samuel Morton Peto, Esq., M.P., Somerleyton Hall, Suffolk, and which is, without exception, the handsomest of the genus. The flowers are white, the upper and lower parts of the throat being surrounded (as in G. Fyfiana) with the richest crimson lake. It is a profuse bloomer, the flowers very large, of great substance, and of the finest form, and will prove a most valuable addition to this beautiful genus.

Good established Plants are now being sent out at 15*s.* each, with the usual discount to the trade, if three or more are taken.—YOUELL and Co., Royal Nursery, Great Yarmouth.

BEAUTIFUL BOUQUETS OF FLOWERS may be preserved perfectly fresh and blooming, for several days, in GLASSES adapted for gentlemen's coat button-holes, any part of a lady's dress, the hand, or for plaiting into the hair; and are forwarded to any part of the Kingdom, post free, in a box containing one dozen of the various kinds, on the receipt of postage stamps value 2*s.* 6*d.*, by JACKSON and TOWNSON, 89, Bishopsgate-street Within, London.

TO BE SOLD, A PORTABLE SPAN-ROOF GREENHOUSE, 13 feet by 11 feet.—For particulars, apply personally to Mr. J. LEWIS, Stamford-hill, near London.

FIFTY PER CENT. CHEAPER THAN AT ANY OTHER MANUFACTORY.
FRUIT TREES.—FLOWER BEDS.

THE ELASTIC HEXAGON GARDEN NETTING, 76 meshes to the square inch, effectually excludes birds, wasps, flies, &c, from fruit trees, flower or seed beds, at 4½*d.* per square yard. New Twine Net ing, one yard wide, 1½*d.* per yard; two yards wide, 3*d.* per yard. Worsted Netting, two yards wide, 4*d.* per yard; four yards wide, 8*d.* per yard. Sheepfolding Net, of superior quality, four feet high, 4*d.* per yard; Three Stranded Cord do., 6*d.* per yard. The Repaired Tanned Fishing Netting, two or three yards wide, 1½*d.* per yard; four or six yards wide, 3*d.* per yard—exactly the same as advertised by others at double the above prices. Unrepaired Net for bakers' scuffles, 14*s.* per cwt., less than ½*d.* per yard. Nets made to order.—The trade supplied at W. CULLINGFORD'S, 1, Strathmore-terrace, Shadwell, within 50 yards of the Shadwell Station, Blackwall Railway. Orders, by post, punctually attended to.

ROSES.

"SANGSTER'S FLORUMBRA," for the protection of choice Roses, when in bloom, from sun or rain, as well as for destroying the Green Fly, with the assistance of Brown's Fumigator, may be had wholesale of Messrs. BARREN and GROOM, London; and retail of most Seedsmen and Iron mongers in the Kingdom; and of W. and J. SANGSTER, at their Manufactory, 75, Cheapside. Price, as Shades only, from 4*s.* each, or complete, from 7*s.* 6*d.* according to size. List of prices sent on application.

HORTICULTURAL TOOL WAREHOUSE.

GREEN AND CONSTABLE, WHOLESALE and RETAIL IRONMONGERS, 36, King William-street (four doors from London Bridge), beg to inform Amateurs and Gardeners they have a large assortment of new and improved Garden Tools, including Lyndon's Patent Spades, Lord Vernon's Patent Hoes, jointed Hothouse Syringes, Galvanised Iron Garden Engines, Transplanting Tools, Patent Water-pots, Brown's Patent Fumigator, Improved Garden Labels and Sticks; also a large assortment of Saynor's Pruning and Budding Knives.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening pursuits, are invited to examine G. and J. DEANE'S extensive Stock of GARDENING AND PRUNING IMPLEMENTS, best London made Garden Engines and Syringes, Coalbrookdale Garden Seats and Chairs.

G. and J. DEANE are sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with the Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom.

Also, wholesale and retail Agents for Saynor's celebrated Pruning Knives, used exclusively by the first gardeners in the United Kingdom. GEORGE and JOHN DEANE (opening to the Monument) London Bridge.

MARQUEES, Tents, and Flags, for SALE and on HIRE. Rick, hay, and waggon cloths; ropes, twines, and sacks; cocoa matting and mats. Manufacturers by Royal Letters Patent: MORISON and HUBN, 25, Norton-falgate.

GREENHOUSES.

HENRY FREEMAN, HOTHOUSE BUILDER, and HOT WATER APPARATUS MANUFACTURER, Triangle, Hackney, London, begs to solicit the attention of the gentry to his low prices for cash. Good substantial-built Greenhouses, fixed complete, 42 feet long by 13 feet wide, 90*l.*; 21 feet long by 13 feet wide, 50*l.*; 12½ feet long by 10 feet wide, 30*l.* A large assortment of Conservatories, Hothouses, Pits, Melon and Cucumber Boxes, Iron Hand-lights, Summer-houses, Seats, &c. Estimates in the above line, either in wood or iron.

HORTICULTURAL BUILDING AND HEATING BY HOT-WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which for elegance of design, good materials and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

GLASS. GLASS.

*N.B.—The Patent Rough Plate, one-eighth of an inch thick, is supplied in quantities 62 by 18 inches, for 10 feet span ridge and furrow roofs, at a reduced price.*

NOTE.—Squares are charged according to the superficial contents, except where the length exceeds the restriction above, in which case the higher price is charged irrespective of the contents.

*Bending.*—1-8*ths*, 6*d.*; 3-16*ths*, 9*d.*; ¼ *inch*, 1*s. per foot, net.*

*Irregular shapes are charged as squares.*

*When Crates are ordered, the 30-inch widths will be sent, unless otherwise specified.*

JAMES PHILLIPS & CO., HORTICULTURAL GLASS MERCHANTS, 116, BISHOPSGATE-STREET WITHOUT, LONDON.

THE PATENT ROUGH PLATE, one-eighth of an inch thick, and weighing 2 lbs. to the foot, has now become an article of very extensive and increasing consumption.

*It is universally admitted to be the best and most suitable Glass for Ridge and Furrow Roofs, Greenhouses, Factories, Workshops,*

And all such like purposes, and is a cheap and efficient substitute for Fluted or Obscured Glass, where the object is to intercept the vision without diminishing the light. Its non-transparency, strength, and cost (being no more weight for weight than Common Sheet Glass), render it eminently suitable for the Glazing of Conservatories and Roofs of all kinds; Blinds are unnecessary, and when used in Greenhouses *no scorching occurs.*

Where still greater strength is required the 3-16ths and ¼ inch thick will be found much cheaper than the Common Rough Plate. Samples will be forwarded on application, by applying to

---

GLASS WATER PIPES.

MESSRS. COATHUPE AND CO., CROWN and SHEET GLASS MANUFACTURERS, Nailsea, near Bristol, Somerset, beg to inform Engineers and others that they are supplying GLASS PIPES, with their Joints, from 1 to 4 inches bore, capable of bearing very great atmospheric pressure, in lengths from 3 to 7 feet, the lengths being less as the diameter of the bores increase. These Pipes may be seen at the Exhibition (Class 24, Section 47), with their forms and modes of joining, in the Section allotted to the Glass Manufactures; and references can be given of their great utility in numerous localities, where they have been successfully employed. The great advantage of Glass Pipes for the conveyance of pure water over all metallic substances, has been too largely dwelt upon by medical and scientific authorities to require any further comment.

Nailsea Glass Works, near Bristol.

---

GLASS.

THOMAS MILLINGTON'S FOREIGN SHEET GLASS is far superior to any other manufacture, as well as cheaper. In 100 feet boxes packed for immediate delivery.

PATENT ROUGH PLATE, THICK CROWN GLASS, and PATENT PLATE GLASS for Horticultural purposes, at reduced prices, by the 100 square feet.

GLASS TILES AND SLATES made to any size or pattern, either in Sheet or Rough Plate Glass.

Propagating Glasses, Bee-hive Glasses, Cucumber Tubes, Glass Milk Pans, Glass Water Pipes, and various other articles not hitherto manufactured in glass.

PATENT PLATE GLASS.—The present extremely moderate price of this superior article should cause it to supersede all other inferior window glass in a gentleman's residence. No alteration connected with the sash is required.

GLASS SHADES, as ornamental to, and for the preservation of every description of goods susceptible of injury by exposure. Prices, since the removal of the Excise duty, reduced one-half. List of Prices and Estimates forwarded on application to JAMES HETLEY and Co., 35, Soho-square, London.

---

COCHIN CHINA CHICKS.—A few first-rate birds for sale.—Address, C. B., care of Publisher of *Gardeners' Chronicle.*

---

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.
PATENT VULCANISED INDIA-RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and) Manufacturer, Goswell Road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use; are particularly suitable for Fire Engines, and are found exceedingly useful in dwelling-houses for conveying Hot or Cold Water to Baths, &c.

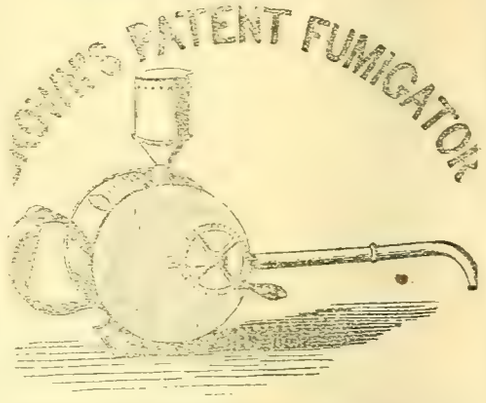
Testimonials and prices may be had on application to the Manufactory.

N.B.—Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

All Letters or Orders addressed to J. L. HANCOCK, Goswell Mews, Goswell Road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boats, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

---



BY HER MAJESTY'S ROYAL LETTERS PATENT.

GALVANISED SHEET-IRON GREENHOUSES, HOTHOUSES, CONSERVATORIES, &c.

E. DENCH, Inventor, Patentee, and Sole Manufacturer, King's-road, Chelsea, who now offers 10*l.* to any person that can show a House of Grapes, equal for Quality, Quantity, and in proportion to space and age of Vines, as Mr. Thomas Frost, Head Gardener to Edward L. Betts, Esq., Preston-hall, which is a Galvanised Sheet-iron House, built and heated by himself. The superiority of these Houses having been fully proved in all parts of the Kingdom, references can be given in every instance where a Patent House has been erected. E. D. has five Patent Houses of different sizes for sale, and some as low as 1*d.* and 2*d.* per foot super., complete, thinking of making alterations on the premises, and has erected two Patent Greenhouses in the open space of the Great Exhibition; one the roof glazed without putty or wood, and one with putty. Heating by Hot-water.

---

PRICE TEN SHILLINGS AND UPWARDS.

A PORTABLE INSTRUMENT for Fumigating Greenhouses, Stoves, and Frames, or Shrubs and Flowers, in the open air, more effectually in conjunction with SANGSTER'S FLORUMBRA, without injuring the most delicate plant; delivering the smoke cool, in a dense mass, and effecting a great saving of Tobacco.

Manufactured and supplied to the Trade by Messrs. BARBER and GROOM, London; and may be had of all Ironmongers, Seedsmen, and Florists.

---

IRON GATES, HURDLES, WIRE WORK, &c.

THOMAS PERRY AND SONS, 252, OXFORD-STREET (NEAR HYDE-PARK), And Highfield Iron-works, Bilston,

MANUFACTURE all kinds of Park Entrance, Carriage and Field Gates, Wickets, Wrought and Cast Iron Gate Pillars, Plain and Ornamental Fencing, Palisading, and Balconies.

Ox, Cattle, Sheep, and other Hurdles.

Tree Guards, Garden Seats, Garden Rollers, Wheelbarrows.

Stable Fittings, &c.—Iron Work of every description.

Wire Work in great variety, comprising Gothic and other Fencing, Flower Stands, Trainers, Arches, Pheasantries, &c.

The works being situated in the centre of the Staffordshire Iron district, THOMAS PERRY AND SONS are enabled to execute promptly orders to any extent with the greatest facility, of the best quality, and on the most moderate terms.

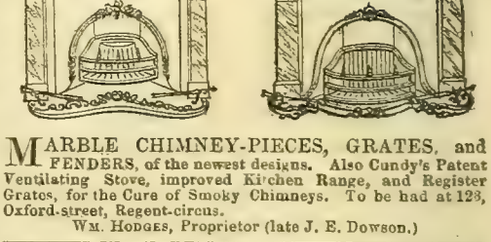
Manufacturers of every kind of Solid Iron and Tube BEDSTEADS, with all the recent improvements.

---

TO NOBLEMEN, LANDED GENTRY, AGRICULTURISTS, ROAD AND RAILWAY CONTRACTORS.

WIRE STRAND FENCING, as furnished with all its fittings, by R. S. NEWALL and Co., having elicited the unqualified approval of practical men, is confidently recommended as the best Fencing for Park and Farm Inclosures, or Subdivisions, for temporary agricultural inclosures (instead of any kind of hurdles), for road-side and all other Fencing.

The PATENT WIRE STRAND FENCE possesses an economy, security, and durability, not to be found in combination in any other Fence hitherto introduced. This Fence, as fitted by R. S. NEWALL and Co. (after the model of the Fences of this material in the Slopes, and Home-park, at Windsor), has the inherent property of remaining equally tight and rigid, under any variations of temperature.



N.B. Estimates given at so much per running yard, for Fencing, fixed complete. Specimens, Sketches, or any other particulars, will be forwarded on application.

Office and Warehouse, 130, Strand, London.

---

ZOOLOGICAL GARDENS, REGENT'S PARK.—The URAN UTAN, presented by the Governor of Singapore, is exhibited daily from 12 to 6 o'clock, together with the ELEPHANT CALF, and the HIPPOPOTAMUS, presented by His Highness the Viceroy of Egypt. The Band of the First Life Guards will perform, by permission of Colonel Hall, at 4 o'clock, on every Saturday, until further notice. Admission 1*s.* ON MONDAYS 6*d.*

---

MARBLE CHIMNEY-PIECES, GRATES, and FENDERS, of the newest designs. Also Cundy's Patent Ventilating Stove, improved Kitchen Range, and Register Grates, for the Cure of Smoky Chimneys. To be had at 128, Oxford-street, Regent-circus.

WM. HODGES, Proprietor (late J. E. Dowson.)

---

HOUSE FURNISHING AND INTERIOR DECORATIVE ESTABLISHMENT, 451, OXFORD-STREET, LONDON.—Cabinet Furniture of every description at marked prices—Brussels Carpet, 2*s.* 6*d.* per yard.—Damask Curtains, 10*d.* per yard and upwards; Ditto, in Silk and Worsted (French fabric), nearly two yards wide, at 8*s.* per yard.—The best Floor Cloths that can be made, cut to any dimensions, 2*s.* 3*d.* per yard. The largest Manufactory in London for Paper Hangings, English and French Decorations, adapted either to the Cottage or the Mansion, fitted up, showing the side of a room furnished.

HORTICULTURAL SOCIETY OF LONDON.—His Grace the Duke of Devonshire, President of the Horticultural Society, has kindly directed the Grounds of Chiswick House to be opened for the reception of the Visitors to the Society's Gardens at the NEXT EXHIBITION, on SATURDAY, the 19th JULY. Tickets are issued to the orders of Fellows of the Society only, at this Office, price 5s.; or at the Garden, in the afternoon of the 19th July, at 7s. 6d. each, but then also only to orders signed by Fellows of the Society. But respectable strangers, or residents in the country, who will forward their addresses in writing to the Vice-Secretary, 21, Regent-street, on or before Thursday, the 17th of July, may obtain from that Office an authority to procure Tickets on this occasion. No official orders for Tickets will be issued after that day.

N.B.—No Tickets will be issued in Regent-street on the day of Exhibition.

Messieurs les étrangers qui desireront se procurer des billets d'admission pourront en obtenir des mandats en s'addressant à leur Ambassade ou à leur Consulate.

PRIVILEGE OF FELLOWS.—Each Fellow of the Society has free personal admission to these Exhibitions without a ticket. He or she may also personally introduce a friend with an Admission Ticket at half-past Twelve, at Gate No. 4, in the Duke of Devonshire's road; or, if unable to attend personally, a wife, brother, son, daughter, or sister, if resident in the family, may represent the Fellow, if furnished with an admission Ticket on which the signature of the Fellow is inscribed.—21, Regent-street, London.

NATIONAL FLORICULTURAL SOCIETY,
21, REGENT-STREET, LONDON.

NOTICE is hereby given, that the SEVENTH MEETING of the above Society will be held on Thursday next, the 10th inst., at 3 o'clock, for the examination of SEEDLING FLORISTS' FLOWERS, and rewarding deserving novelties by granting LABELS OF COMMENDATION, CERTIFICATES OF MERIT, or FIRST CLASS CERTIFICATES, at the discretion of the Censors.

All subjects for examination must be entered, labelled, and staged at least two clear hours before the hour of meeting. Censors are required to be punctual in their attendance at the time stated in their summons, viz., 1 o'clock.

By order, JOHN EDWARDS, Hon Sec.

SEEDLING PELARGONIUM FUND.—The Treasurer takes this opportunity of announcing that a statement of receipts and expenditure will be produced for examination, and the PRIZES PAID. All interested are therefore requested to attend at 21, Regent-street, on the 10th inst., at 1 o'clock.

July, 5th, 1851. JOHN EDWARDS.

SELECTED CINERARIA SEED, saved from one of the choicest and finest varieties in cultivation, this being the proper time for sowing (which any amateur may cultivate with little trouble and sure success), to insure good strong plants that will bloom well the forthcoming season.

Packets of the above can be forwarded to any part, on receipt of 18 penny postage stamps.—EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath.

**The Gardeners' Chronicle.**

*SATURDAY, JULY 5, 1851.*

MEETINGS FOR THE ENSUING WEEK.

| | | | |
|---|---|---|---|
| MONDAY, | July | 7—Entomological | 8 P.M. |
| TUESDAY, | — | 8—Vauxhall Gardens | 6 P.M. |
| | | 8—London Floricultural | 6 P.M. |
| | | 8—Zoological | 9 P.M. |

COUNTRY SHOWS.—Tuesday, July 8: South Devon Botanical and Horticultural, and Truro Horticultural.—Wednesday July 9: Barton-on-Humber Horticultural.

SHALL WE KEEP THE CRYSTAL PALACE? says "DENARIUS." WHAT IS TO BECOME OF THE CRYSTAL PALACE? asks Mr. PAXTON; and the same questions are daily put by thousands of voices, less powerful but not less earnest. As yet no answer has been given, and probably no answer will be given till the public has more generally expressed its own opinion. Let us then endeavour to point out to those who do us the honour to read our columns in what way this question strikes us.

"DENARIUS" believes that the building may be applied to various scientific uses, that it may become a great gallery of sculpture, a winter garden filled with fountains and groves of Orange trees, a gymnasium where science and art may unite in friendly contest, where schools and lectures would naturally arise, and where periodical exhibitions would be held of silk-weaving or cotton-printing, and the manufactures which give their names to the great City Corporations, the Goldsmiths', the Ironmongers', the Mercers', the Dyers', &c. "If the place," he says, "were recognised as a receptacle for plants and shrubs, it might be expected that in a very short time it would be well furnished with public donations. Proceeding with the development of this idea more in detail, it may be pointed out that the nave and the aisles 48 feet wide would give a space of 10 acres independently of the galleries, which would give in addition walks exceeding a mile. The ground-floor might be used for plantations and sculpture, the galleries for potted flowers and smaller works of statuary; but care should be taken to consider the promenade as the chief feature, and not to occupy too much space with the collections. The public would desire to have walks among flowers and plants—not flowers and plants with some walks. This last kind of treatment belongs to Kew and Chiswick, and the Regent's Park. Spaces at the extreme sides of the building might be kept vacant to be applied to various public purposes, such as periodical exhibitions of agricultural produce, colonial raw produce, machinery, perhaps models of objects claiming patent rights, manufactures, and fine arts."

These ideas he, however, as we understand him, only offers as "supplementary to the great object of a winter garden;" and we are bound to say, that we doubt the wisdom of carrying them out, even if it were possible.

Mr. PAXTON, whose pamphlet we reprint in another column, entertains different views. He would have a garden or park, and nothing more, embellished with birds, and flowers, and trees, and sculpture, displayed in a climate temperate at all seasons. HIC VER PERPETUUM would be inscribed above his portals, and the scene within them would be that of a noble "park, decorated with the beauties of nature and art, under a sky-roof, having a climate, warmed and ventilated for the purpose of health alone, furnishing, close to their own firesides, a promenade unequalled in the world, and, for the six winter months, a temperature analogous to that of Southern Italy. Beautiful creeping plants might be planted against the columns, and trailed along the girders, so as to give shade in summer, while the effect they would produce by festooning in every diversity of form over the building, would give the whole a most enchanting and gorgeous finish."

Are these visions capable of being realised? That is the question which it really interests us to answer. The funds and means out of which such a reality may arise are subordinate considerations; especially since the building, the main feature in any calculation of cost, may be said to be already paid for.

That all which Mr. PAXTON proposes to do may be easily done, no one acquainted with gardening will doubt; that the climate of Naples or Madeira may be secured to Hyde Park by means of the Crystal Palace, is as certain as the existence of those two countries. All we require in order to accomplish such an end is a heating power, which will exclude frost in winter, and a water power which will exclude drought in summer. The rest is simple. That the great engineers who put together the vast fabric can water it and heat it, nobody doubts; that plants will thrive in it if heated and watered, we all of us know perfectly well.

But would such a winter garden be attended by the advantages that are expected from it to public health and convenience? That is to say, would it be agreeable to ride and walk under shelter while rain or snow is falling all around? Would it be comfortable to have a cool garden of 18 acres as a place of resort in the dog-days? Have dust or mud irresistible attractions to us English? These are matters of taste which all men can judge of for themselves.

If we look at the matter as it affects the value of contiguous property, then such questions as the following arise. Would it be advantageous to the neighbourhood to be within a few minutes' walk of Naples or Madeira? Would invalids find any comfort therein? Would the aged and infirm? And if health and comfort should be increased by turning the Crystal Palace into such a place as Mr. PAXTON contemplates, would the value of houses and land at Knightsbridge, Kensington, Brompton, and Bayswater, rise or fall? The owners of property there will probably express their opinion as to those points.

Should all these questions be answered in the affirmative (and who can doubt it); if the comfort, the health, the enjoyment, the wealth of the metropolis would be thus largely increased, by converting the Crystal Palace into such a park as could only be naturally found in Portugal or Madeira, then the last inquiry that we should make would be, WHO WILL RECOMMEND ITS REMOVAL, when a short Act of Parliament shall be introduced to enable it to remain where it is.

---

IN speaking of the influence of CARBONIC ACID GAS upon growing plants, and pointing out the effects which they produce in regulating the composition of the atmosphere, two questions naturally arose, the one relating to the entire quantity of carbonic acid at all times to be found in the air, and the second, having reference to the more practical question of artificial supplies of that substance, to plants cultivated under glass, or in houses. Both these points deserve a little further consideration. It is plainly evident, that if the composition of the entire atmosphere were liable to undergo considerable fluctuations, it would naturally produce corresponding effects on the growth of plants; on the contrary, however, there is good proof that the proportion of carbonic acid in the air is very nearly always the same. The cause of this, we shall now proceed to show, is not so much that the production of carbonic acid is always exactly counterbalanced by its decomposition by plants, but that the quantity of that substance which the whole atmosphere contains, is so vast, that no ordinary natural cause is able to make any sensible change in its average proportion, in the space of a single year or two.

Perhaps the best way in which we are able to gain any clear idea of such enormous quantities as the volume of carbonic acid produced during an entire year by the breathing of the whole human race, is, as we have already said, by attempting to ascertain what relation it bears to the bulk and weight of the entire atmosphere; and though in doing so we must necessarily speak of even still larger quantities than those just mentioned, yet the subsequent comparison is comparatively easy. It is well known that the atmosphere is not all of the same density; that the higher we ascend, the rarer and more attenuated it becomes, of which, in fact, we have an accurate measure in the fall of the barometer, when it is taken up the side of a hill, or in a balloon. By means, too, of the barometer, it is easy to calculate the weight and bulk of the entire atmosphere; and we learn that the whole quantity is equal to one mile in height, the whole being supposed to be of the same density as that of the air at the surface of the earth. In order then to ascertain the bulk of the entire atmosphere, and to know the extent of the storehouse of vegetable food from which plants derive their nourishment, we have only to calculate the surface of the whole globe, and ascertain how many cubic miles of air would be required to cover it. In round numbers the quantity is nearly 200 million of cubic miles. Now a cubic mile of air would weigh about 1,673,290 tons, and consequently if we wish to know the weight of the whole atmosphere, we must multiply these two numbers together, and we shall have 334,658,000,000,000 tons!

As far, however, as plants are concerned, we have only to consider that small portion of the atmosphere, the carbonic acid which it contains, and which amounts to about one-thousandth part; in calculating therefore the total supply of carbonic acid, on which plants have to depend, we must divide these large numbers by a thousand, which leaves us 200,000 cubic miles of carbonic acid, or, in weight, about 350,000,000,000 tons. Now, the statement with which we set out was, that the quantity of carbonic acid which would be formed during a whole year, by the breathing of 600 millions of human beings, would be 145 millions of tons; and this, large as it is, is evidently but a small quantity compared to the whole quantity which usually exists in the atmosphere; in fact, it only amounts to about one 2400th part of the whole quantity. With this statement before us, it is not so difficult to understand the kind of natural balance which must exist between the production of carbonic acid, on the surface of the earth, and its decomposition by growing plants. It is plain from the action of the winds, and other causes, that the whole mass of the atmosphere must be in a constant state of mixture, and that the carbonic acid poured into it must be soon regularly diffused throughout the whole of it; observing, then, the enormous quantity of this gas, which is at all times present in the atmosphere, it is evident that a very considerable addition may at any time be made to it without any very evident increase being produced in its relation to the entire atmosphere. From what we have just shown, it appears that the carbonic acid gas formed by the respiration of the whole human race, large as the quantity certainly is, would not, in a century, do more than increase the present proportion one twenty-fourth part. Such a quantity must be added to the atmosphere every year, for more than 10,000 years in succession, in order to double the present proportion of carbonic acid.

It is difficult to understand how the growth of plants should be so nicely proportioned to the formation of carbonic acid, as to insure constant equality of composition in the atmosphere; although as INGENHOUSZ has well observed, the circumstances which tend to increase the formation of carbonic acid, are also, for the most part, those most favourable to the growth and development of plants. But from the facts just stated, we may be led to inquire whether a very considerable increase in the total quantity of carbonic acid in the atmosphere may not take place, which yet would not cause the per centage to be raised to an extent capable of being indicated by the most accurate chemical tests. That this may really be the case, a very little consideration will readily prove; setting aside the extreme difficulty and delicacy of the experiment, it appears that the recorded results of different observers vary considerably, and though the evidence is quite satisfactory that the average amount is not far from one-thousandth part of the whole air, yet it has sometimes been found to be as low as one two-thousandth, or even still less. The acknowledged variation may be fairly set down at from one-thousandth to one twelve hundred and fiftieth—one quarter of the whole; a variation which, if it happened to occur equally throughout the atmosphere, would evidently amount to many thousand millions of tons. In fact, so large is the quantity of

carbonic acid in the atmosphere, that it would be years before any visible increase could be produced from any natural source, and consequently also, it might be months before the counteracting influence of vegetation began to produce any sensible diminution.

The growth of land plants however, is not the only means by which the atmosphere is purified, the sea also performs a very important part in the absorption of carbonic acid; the proportion of carbonic acid in the air appears to be generally diminished by storms; and the air collected out at sea, especially in stormy weather, contains a smaller proportion of carbonic acid than that which is collected some way from the sea-shore. It is probable that as much carbonic acid is absorbed and decomposed by marine plants every year as by those which grow upon the land; that which is abstracted by the latter is for the most part sooner or later again returned to the atmosphere, by decay or combustion; but that which is removed by marine plants is apparently altogether lost as regards the growth of future plants, possibly it in part goes to form beds of carbonaceous matters, analogous to coal. The practical conclusion which we would draw from these remarks is, that the quantity of carbonic acid decomposed by the vegetation of the whole globe in a year, may be greater or less, by many hundred thousand tons, than the quantity formed during the same time, and yet no sensible difference may be perceived in the composition and properties of the air.

It is a well ascertained fact that the power of plants to decompose carbonic acid varies very considerably, according to the conditions under which the plant is placed; it depends on vigour and vitality in the plant, on temperature, and on the influence of the sun's light. Ingenhousz and Saussure found that the power of decomposing carbonic acid was greatest at a certain hour in the morning, and that after that period it began to decline, even though the strength of the sun's rays continued to increase. It is true that many of these experiments were made in small glass receivers, and consequently under highly artificial and unnatural conditions, but they are nevertheless quite varied and accurate enough to establish the general conclusion, that at some periods plants are much more able to decompose carbonic acid than they are at others. It is probable that in the free and open air those conditions most favourable to the growth of the plant are also favourable to its obtaining carbonic acid; but when plants are cultivated in a close house, and more especially when the house contains a comparatively small surface of earth, it is certainly quite possible that the plants may not always be able to obtain as much carbonic acid as they could decompose, and in such cases the artificial addition of carbonic acid to the air might be advantageous. It is an experiment which could easily be tried, and one which might very probably lead to interesting results. It is obvious, that the gas should only be introduced at that period of the day when the growing powers of the plants are most active; and probably not more than from a thirtieth to a fortieth of the whole volume of the air should be introduced at a time. In an ordinary hot-bed or tan-pit, the effects produced are chiefly due to the increased temperature, but at the same time some benefit is certainly produced by the carbonic acid evolved; in this case, however, the gas is constantly and regularly evolved, and bears no relation to the powers or wants of the plants; very nearly as much food is offered to them in the middle of the night, when they are wholly unable to make use of it, as in the brightest part of the morning. If an experiment were tried on the artificial addition of carbonic acid to the air of a forcing-house, it is hardly necessary to add, pure carbonic acid must be used; it might be obtained with great facility and of great purity by mixing chalk and sulphuric acid in any suitable vessel. The gas should be introduced pretty early in the morning, allowed to remain in contact with the leaves of the plants during the greater part of the day, the house being entirely closed, and in the afternoon a certain amount of ventilation might be allowed, in order to permit the free circulation of air and the escape of the surplus gas before night.

## THE CRIMSON NYMPHÆA AND OTHER WATER LILIES.

The introduction of Victoria regia into this country has been the commencement of a new era in the history of stove aquatics. The Victoria required a tank or basin of gigantic size, and would not be put off with an instalment of its demands; setting pots and tubs at defiance, it scorned all reasonable bounds, and could not be stowed into any kind of coopery, since a brewer's vat could scarcely float more than one of its splendid leaves. We have, therefore, to thank this noble plant for such a reformation in tanks, as never could have been anticipated by the warmest admirers of this tribe of plants; for if it would have behaved itself, and lived in a tub, two feet in diameter, and flowered, however shabbily, in a bushel of mud, and struggle as other aquatics heretofore had to be contented with, we should never have seen the splendid effect that Nymphæas produce in an aquarium 30 feet wide. Not only have gentlemen built tanks of immense size for the Victoria, but nurserymen have done the same; and besides growing this white Water Lily, they have tried the superior culture applied to the Victoria upon other plants, and the experiment has nobly rewarded them for their pains.

I cannot help stating that I felt rather disappointed on first seeing the flower of the Victoria, after the marvellous display made by its foliage. Such a leaf seemed to promise much, and measuring the bloom by the proportion that Nymphæa flowers bear to their leaves, one might have reasonably expected the Victoria to produce a flower as large as the top of a bushel basket; and if it had been rich in colour, in addition to this large size, it would have been still more desirable; however, with all its beauties and all its shortcomings, it is fair indeed; but its ephemeral life extends only to a day, the morrow dawns only upon its decline, its work is finished, and the foot-prints of decay are stealing over its loveliness. In colour, too, it suffers by comparison with aquatics of less pretensions, for I need only refer to one well known genius, the Nymphæas—plants of the easiest culture, where there is room and warmth afforded them, to show that the tanks erected for the Victoria may be greatly enriched by a margin of Nymphæas—a square yard or two of space is all that they require; in fragrance they are not to be surpassed; in colour, some are of the purest white, others are of the fairest shades of blue, whilst one or two are crimson.

On visiting the new Victoria house at Messrs. Knight and Perry's the other day, I was handsomely rewarded, after the many long miles I had travelled, to see the "Lions of London" with a sight of by far the loveliest flower I had ever set my eyes upon. It grew in a corner of the tank, and might be 25 feet from where I stood; it was a Nymphæa with a flower about as long as my hand, possessing the colour of Le Géant des Batailles Rose, and like all other plants or flowers that grow upon the brink of still water or that float upon its bosom, it was reflected in the "liquid element" and consequently counted double; therefore, if any one is at all disappointed, as I confess I was, in the flower of the Victoria regia, let him try a verge of Nymphæas, and he will not go unrewarded. I would also just hint to the London sight-seer, that a cab-hire of half-a-crown to Chelsea will not be thrown away in a visit to the nursery in question, where this beautiful plant is in bloom; and before I take leave of this subject, I would beg to remark, that as the Victoria Lily has raised the tanks to a dignified standing, as compared with what they were, the same dignity ought to be observed in the plants that are made to associate with this queenly flower.

The Nymphæas are worthy of a place in every large tank, and those who can add Nelumbiums will find that these three genera, well grown, will form such a selection as cannot be excelled by any aquatics in cultivation.

I was led to this remark, by seeing in one place the gouty legs of Pontederia crassipes, and the light foliage of Limnocharis Humboldtii, floating under the heavy batteries of the Victoria, which seemed ready to swamp them with the next leaf that it unfurled. *Alex. Forsyth, St. Mary's Church, June 26.* [Now that 3500*l.* are voted for an aquarium at Kew, it is to be hoped that we shall see water plants as they ought to be seen.]

## WHAT IS TO BECOME OF THE CRYSTAL PALACE?

By Joseph Paxton.

The time is approaching when the World's Fair will terminate, and the vast roof under which it is held, being no longer required for that purpose, must, according to the terms of agreement with the Commissioners of Woods and Forests, be removed; and, by this time next year, the ground is to be made as smooth, and the Grass is to look as green, as before the 25th of September, 1850 The Exhibited articles will all be removed, and many of them will be looked upon as precious relics, connected with an event, the greatest of our times, and they will be cherished more and more as they become separated further from the day of their great triumph, whilst the Building (I hope I may say without vanity)—the great feature of the Exhibition—must, if removed, be either transported to another country, or be rent asunder and dispersed in fragments to perform a variety of inferior offices Now, if I can show—as I believe I can—good reasons why the structure should remain standing, I trust the Royal Commissioners will do all in their power to further that object.

Apart, then, from all thoughts of its present use, and also from all those considerations which fairly entitle it to great attention—the Building, I would suggest, should be allowed to remain standing, on account of its peculiar fitness to supply a great public want, which London, with its two and a half millions of inhabitants, stands most essentially in need of—namely, a *Winter Park and Garden* under glass.

When I determined on sending in a design for the Glass Palace, I had in view quite as much the after purpose for which the Building could be adapted as the object then more immediately required; and, in my original prospectus, I prominently mentioned the fact, as one which had received a large share of my attention. Since that day nothing has transpired to alter my views, but, on the contrary, everything has contributed to strengthen and establish them, and to further convince me, if such further conviction had been needed, how valuable an appendage to this great metropolis would be a large national place of recreation and instruction, such as I propose.

Within the last 20 years, the physiology, economy, and requirements of animated nature, with the effects which climate, locality, and various contingencies have upon their health and habits, have been studied and examined, with the best results. Geology, closely connected with the study of plants, has, in its wondrous discoveries, unfolded to our view the mysteries of ages long gone by, when the earth's inhabitants differed widely from those now seen occupying its surface; of these no recorded history furnishes us with particulars, and but for this science we must have looked back through the thick mist of time, with scarcely a glimmering of light to guide us. By the aid of Chemistry and Botany many useful discoveries have been made, which practical Horticulture has rendered subservient to the comforts and happiness of man; and the removal of the duty on glass has given an impetus to this science which only a short time ago no efforts could possibly have called into action; indeed, had that duty still existed, no building such as I am now treating of could possibly have been erected, and without an extensive use of glass, to equally admit and diffuse a subdued light, no such display as at present could have been secured.

The achievements of Horticulture, however, do not stop here, or merely consist in what has been accomplished within the Great Exhibition Building, where dry and polished articles and the most tender fabrics may be safely preserved; but it leads onwards to the formation of climates, which even under opposite influences are rendered healthy, and suited to the wants and requirements of man. Formerly, wherever plants were congregated beneath a glass structure, the atmosphere was invariably deteriorated, and rendered unfit for being more than transiently inhaled; the usual method with visitors being to take a hurried view of the chief beauties within, and then retire to a more genial air. But now Plant-structures are no longer unhealthy, pent-up ovens; although the immense variety of objects they contain form a remarkable contrast with the meagre appearance of former collections, yet these objects are seen growing with an ease and natural vigour which, with the limited knowledge and means we possessed formerly, it was impossible to imitate. The ventilation and climate of our dwelling-houses have also been considered, and many additions to our comfort have in this respect been made. The perfection of these internal arrangements, contrasted with the atmosphere without, renders it still more desirable that something on a large scale should be done to counteract the effects of the outer air, which, in this country, and in the neighbourhood of London especially, is often during many months in the year impure, murky, and unfit for healthy recreation and enjoyment; and it is to meet this want that I offer the present recommendation. All hitherto erected structures, however great and noble some of them are, fall far short of answering this end, and I cannot but recommend, now that we do possess a building like the Crystal Palace, which in its dimensions is the best adapted for such a purpose of anything that has been hitherto attempted, that it should be so appropriated—and especially as its peculiar site between Hyde Park and Kensington Gardens is the best spot that could have been selected; connecting as it does those two great promenades—it appears exactly calculated to concentrate beneath its roof the pleasures of both.

A Building like this, if properly laid out, will open a wide field of intellectual and healthful enjoyment; it will likewise, I hope, stimulate the wealthy in large manufacturing towns to a similar adoption of what may now be raised so cheaply; and when judiciously furnished with vegetation, ornamented with sculpture and fountains, and illustrated with the beautiful works of Nature, how pure, elevating, and beneficial would its studies and exercises be. At present England furnishes no such place of public resort, for although Kew has a splendid Palm-house, where daily are congregated a great number of individuals, yet its warm and humid atmosphere is only calculated to admit of visitors taking a hasty view of the wonders of the tropics, as they pass in their walks through the gardens. On the contrary, in the Winter Park and Garden I propose, climate would be the principal thing studied; all the furnishing and fitting up would have special reference to that end, so that the pleasures found in it would be of a character which all who visit could share; here would be supplied the climate of Southern Italy, where multitudes might ride, walk, or recline amidst groves of fragrant trees, and here they might leisurely examine the works of Nature and Art, regardless of the biting east winds or the drifting snow. Here vegetation in much of its beauty might be studied with unusual advantages, and the singular properties examined of those great filterers of Nature, which during the night season, when the bulk of animal life are in a quiescent state, inhale the oxygen of the air, whilst in the day, when the mass of animal existence have started into activity, they drink in the carbonic supply, given out by man and animals, which goes to form their solid substance, at the same time pouring forth streams of oxygen, which, mingling with the surrounding atmosphere, gives vigour to man's body and cheerfulness to his spirits.

In this Winter Park and Garden, the trees and plants might be so arranged as to give great diversity of views and picturesque effect. Spaces might be set apart for equestrian exercise, and for carriage drives; but the main body of the building should be arranged with the view of giving great extent and variety for those who promenade on foot. Fountains, statuary, and every description of park and garden ornament, would greatly heighten the effect and beauty of the scene.

Beautiful creeping plants might be planted against the columns, and trailed along the girders, so as to give shade in summer, while the effect they would produce by festooning in every diversity of form over the Building, would give the whole a most enchanting and gorgeous finish. Besides these, there might be introduced a collection of living birds from all temperate climates, and the science of Geology, so closely connected with the study of plants, might be illustrated on a large and natural scale, thus making practical Botany, Ornithology, and Geology, familiar to every visitor.

The alterations necessary to the Building itself, to produce the effects I have suggested, would not be many or cost much money. Shortly will be published by me a view showing how the whole may be finished so as to do away with all idea of smoke, chimneys, or other kind of nuisance. The details of the alterations necessary I do not propose to treat of now; but I may mention, for the information of those who live opposite the Crystal Palace, that I should recommend the wood boarding round the bottom tier of the Building to be removed and replaced with glass; the present appearance of it is heavy, and gives anything but the idea indicated by its name; when glass is substituted for wood, the appearance will be marvellously changed; those who drive and ride in the park will even in winter see the objects within as they pass by, and the whole will have a light aerial appearance totally unlike what it has at present. In summer I should recommend the whole lower glass tier to be entirely removed, so as to give, from the park and the houses opposite the Palace, an appearance of continuous park and garden. Here I must state what I believe will be the position of those who live opposite the Crystal Palace. I fully admit they have had just cause of complaint by having all the turmoil of so vast an undertaking as the Great Exhibition developed under their eyes and ears, with all its attendant inconveniences; but if the Building is allowed to stand, and be adapted as I propose, the advantages derivable to them will fully compensate for all the evil they may have sustained in that respect. The boarding being all removed and glass substituted, they will have, within a few minutes' walk, a beautiful park, decorated with the beauties of Nature and Art, under a sky-roof, having a climate, warmed and ventilated for the purpose of health alone, furnishing, close to their own firesides, a promenade unequalled in the world, and, for the six winter months, a temperature analogous to that of Southern Italy; and I have no doubt the property in that immediate neighbourhood would, from such an arrangement, considerably advance in value, because of the recreation and exercise afforded to the inhabitants and their families.

The advantages derivable from such an appropriation of the Crystal Palace would be many, and may be thus summed up. In a sanitary point of view its benefits would be incalculable. By its various objects it would produce a new and soothing pleasure to the mind. The great truths of Nature and Art

would be constantly exemplified. Peculiar facilities would especially be given for the development on a large scale of the sciences of Botany, Geology, and Ornithology. A temperate climate would be supplied at all seasons. Taste would be improved by individuals becoming familiar with objects of the highest order of Art, and by viewing the more beautiful parts of Nature without its deformities. Pleasant exercise could be taken at all times, and in every variety of weather. It would serve as a drive, for equestrian exercise, for a promenade or lounge, and as a place which could at all seasons be resorted to with advantage by the most delicate.

Although the Crystal Palace at present, with its magnificent display of useful and ornamental articles, is truly wonderful, yet if the Building be converted into a Winter Park and Garden, and arranged as I propose, I feel confident it would become a still more extraordinary and beautiful object. These things all considered, I cannot help expressing an earnest hope that the Building will be allowed to stand, and be converted to so laudable a use. The cost of forming it in the first instance must entirely depend upon the extent to which my proposition is carried out. Should it be decided for the Building to stand, and be so appropriated, a calculation of the cost could readily be given.

I have, however, thought it right to state what I believe would be the annual outlay, if the whole were kept in first-rate condition and constant repair; of course, a less sum would be required if a high standard was not aimed at; and this yearly sum might be obtained either by a national grant, or by making the Building itself self-supporting.

ANNUAL EXPENDITURE.

| | |
|---|---|
| Labour, fuel, water, implements, gravel for walks, feeding and attendance to Birds, and general superintendence ... ... ... ... ... ... ... | £8,000 |
| Besides the above, constant painting and renewal would be required; for this a Reserve Fund should be provided, and by which the Building might be renewed for ever ... ... ... ... ... ... ... | £4,000 |
| Making a total of ... ... | £12,000 |

## ORCHIDS FOR THE MILLION.—No. VII.

By B. S. WILLIAMS, gr. to C. B. WARNER, Esq., Hoddesdon.

PROPAGATION.—There are different modes of propagating the various kinds of Orchids; some are easily increased by dividing them into pieces, or by cutting the old pseudo-bulbs from the plants, after the latter have done blooming; such plants as Dendrobiums are increased in this way. The best time for dividing the plants is just as they begin to grow, or when they are at rest; they should be cut through with a sharp knife between the pseudo-bulbs, being careful not to harm the roots; each piece should have some roots attached to it. After they are cut through they should be parted, potted, and put in some shady part of the house, without receiving much water at the roots till they have begun to grow and make fresh ones, then they may have a good supply. Dendrobium nobile, Pierardi, pulchellum, macrophyllum, Devonianum, and similar growing sorts, are easily propagated. This is effected by bending the old pseudo bulbs round the basket or pots in which they are growing, or by cutting the old flowering bulbs away from the plant, and laying them on some damp moss, in a shady and warm part of the house, with a good supply of moisture. After they break and make roots, they may be potted, or put in baskets. Such as D. Jenkinsii, D. aggregatum, D. formosum, D. speciosum, D. densiflorum, and similar growing sorts, are increased by dividing the plants.

Aerides, Vandas, Angræcums, Saccolabiums, Camarotis, Renantheras, and similar growing sorts, are all propagated by cutting the tops off the plant just below the first root, or by taking the young growths from the bottom of the plant; after they have formed roots, they should be cut off with a sharp knife, and afterwards put on blocks or in baskets with some sphagnum, and kept in a warm and damp part of the house, without receiving much water, till they have begun to grow, when they may have a good supply. Odontoglossums, Oncidiums, Zygopetalums, Sobralias, Trichopilias, Stanhopeas, Schomburgkias, Peristerias, Mormodes, Miltonias, Lycastes, Leptotes, Lælias, Galeandras, Epidendrums, Cyrtopodiums, Cyrtochilums, Cymbidiums, Cycnoches, Coryanthes, Cœlogyne, Cattleyas, Calanthes, Brassias, Bletias, Barkerias, Aspasias, are all propagated by dividing them into pieces, each having a portion of the roots attached to it, and a young bulb on the pseudo-bulb.

Phaius albus is very easily increased: the best way is to cut the old pseudo-bulbs off after the young ones have begun to flower, that is, just before the plant has made its growth. The pseudo-bulbs should be cut into pieces about 6 inches long, and then put into a pot in some silver sand, with a bell-glass over them, till they have struck root; they should then be potted in some fibrous peat, and should have good drainage, and a good supply of water in the growing season.

Some of the Epidendrums are readily propagated, such as cinnabarinum and crassifolium; these will form plants on the tops of the old flower-stalks; they should be left to grow till they have made their growth, they should then be cut off and potted, and they will soon make good plants. Some Dendrobriums will also form plants on the tops of the old pseudo-bulbs, and they should be treated in the same way.

ON THE MODE OF MAKING BASKETS, AND THE BEST WOOD FOR THAT PURPOSE.—Blocks or baskets are most suitable for true air plants, such as Vandas, Saccolabiums, Aerides, Angræcums, Phalænopsis, &c.; when planted in baskets or on blocks, they send out their roots much stronger into the air, and suck up the moisture; whereas, if their roots are covered too much, they are very apt to rot. Various materials are used for forming baskets; some are made of copper-wire, which is very durable, but I prefer those made of wood, though they do not last so long. They look better, and are more suitable for the roots of the plants to cling to. The best kind of wood is Maple, or Hazel, and the best baskets those of a square shape. The wood should be cut into lengths according to the size of basket required, but do not make them too large; there are two objections to this—one is that they take up much space, the other, that the plants do not require much room; after the wood is cut into proper lengths, the pieces should be bored within 1 inch from the ends, taking care to have all the holes bored the same distance; there should be four lengths of copper wire, one for each corner; the wire should be put through each piece of wood, and brought up to form the handle for suspending the plants from the roofing. Iron wire should never be used in making baskets, for it is probably injurious to the plants.

The best kinds of wood for blocks are Acacia, Apple, Pear, Plum, or Cork, if it can be obtained. The wood should be cut into lengths, according to the sizes required; get some nails and drive one at each end with some copper wire, to form the handle, wind the wire round each nail, and have the handle about 10 inches high. Small copper nails are the best by which to fasten the plants on the blocks.

## BRITISH SONG BIRDS.

(CAGE BIRDS, No. 20.)

No. XXXVI.—We have now arrived at our penultimate chapter. Let me, therefore, once more impress most forcibly on the minds of my readers, before parting company with the nightingale, that these birds form the strongest of all possible attachments—attachments which, when once formed, know no change; unless, indeed, they be cruelly slighted, or thoughtlessly neglected. They do not at all recognise the legal axiom —"*Qui facit per alium, facit per se.*" No servant, therefore, no giddy child, must have the care of them. If you have endeared yourself to them by personal attention, you must continue to minister to their wants and their pleasures, and feed them *with your own hand.*

To a true lover of the feathered tribe, these demands on their affectionate regard will be anything but irksome, for, next to loving, what can exceed the pleasure of being loved? unless, indeed, it be the *knowledge* of that pleasing fact—a knowledge, by the way, that we cannot on *every* "particular occasion" directly arrive at, much being left, *in rerum naturâ*, for hopeful, painful, pleasureable conjecture. I have heard of well-authenticated cases, in which nightingales have pined gradually away from the very day they were handed over to the care of a stranger; refusing their food, and turning melancholy. It has been beautifully remarked, that "love is strong as death." These sweet little innocents are faithful expositors of the fact, and here let me make a slight digression.

One of the regular subscribers to the *Gardeners' Chronicle*, who, in common with many others, feels an uncommon degree of anxiety on the subject of "taming" birds, recently consulted me at some length by letter,* and wished me to enlarge upon this. A few sentences, however, judiciously expressed, will suffice for the desired end.

We have no direct means of divining the "why and because" of certain predilections, and prejudices, observable in birds and other animals. We daily see actions among them for which we cannot in any way account. Thus, for instance, if a dog enter a room full of company, you shall presently observe him make a careful tour of the apartment, sniffing first at one, and then at another of the assembled guests. Towards some, his tail will be seen to wag with every symptom of kindliness and good-will; whilst towards others, he will, with tail deflected, show unmistakeable signs of suspicion, perhaps of disgust. Depend upon it the animal's discernment is rarely at fault. I would willingly be guided by such a Mentor.

Just so is it with the feathered race. Some masters and mistresses can never tame their birds; never get them to be on terms of intimacy. The cause is evident. There are no feelings of *affection* in common between them. They do not love their birds. The latter know as much; and are assuredly aware that they are kept simply for the sake of furnishing amusement. I have noted the same unerring sagacity with all my squirrels. They would instantly detect any person who might be preparing, or wishing, to play them off some practical joke, and would, to my great delight, fasten on them at once,—paying handsomely, and in full, for all favours "about to be" received. It was, however, impossible for *me* to anger them. They too well knew the friendliness of my disposition,—seeing what merry romps and gambols we had together, both by day and night; upstairs, down stairs, and in the garden. No doubt it is a wise provision of Nature, thus to endow our little friends with instinctive powers of perception. The face is the index of the mind. They read our *character* when they catch our eye. But to return.

The nightingale is a remarkable bird for more reasons than one. He is of the most peculiar habits too, whilst sojourning in this country. In some of our most beautiful counties, his visits are unknown. He religiously avoids them; and if caught and let loose there, his exit is as speedy as his entrance. Thus, for instance, he discards, among other beautiful localities, Wales and Devonshire.† In these places, "his voice is never heard." Nor does he wander far into our northern manufacturing counties. He shows his good taste therein. There has been a "pretty" reason assigned for his seceding from Devonshire. The fair lassies of that favoured spot, are, it is said, gifted with heavenly voices; and sing *so* sweetly withal, that our bard of song feels he can have "no position" there.* His gallantry, therefore, and excellent judgment, cause him to direct his flight to other less-favoured parts. I secretly incline, however, to the belief that he *does* visit Devonshire—not as a "performer" indeed, but as a "listener;" for the Devonshire syrens *are*, be it known, lovely choristers,—*Hommage aux dames!* Do not let us, for one instant, deprive them, even in thought, of the happy conceit that exists in their praise.

Why our hero has banished himself from the picturesque scenery of Wales, does *not* so clearly appear. The Welsh harpists and the warbling Jenny Jones-es—attractive though the former, and charming though the latter be—yet come not up to *his* mark. Perhaps his tribe have been undervalued in times gone by—their vocal powers not duly appreciated. Hence, the punishment of the Principality has been condign.

We can more readily comprehend why his lovely face and transporting voice have been averted from Ireland. His song can never be sung in *that* ill-fated country. Even the skylarks, there, forsake their natural food, and with morbid greediness prey on the germ of the young budding corn. It is said that they devastate, in armies, whole acres of land by their voracious appetites. Joyous by nature as our English lark, the Irish lark *has* "attempted" to rise on the wing, and chant his heavenly anthem, but could not. *Vox faucibus hæsit!* He cannot sing—neither can the nightingale—"the Lord's song in so strange a land." *William Kidd, New Road, Hammersmith.*

* See "Answers to Correspondents.—*Arabella C.*," in the *Gardeners' Chronicle*, June 7th.

† The fact of the nightingale not being ever heard or seen in Devonshire—a most astounding truth—is, I observe, again recently confirmed in the *Naturalist*, Monthly Magazine, No. 4. R. A. Julian, Esq., a very intelligent and watchful correspondent of this interesting work, writing from Lara House, Plymouth, says—"I have *never* observed either the nightingale or reed warbler in Devonshire; although I have seen them both tolerably numerous in all our Midland counties."

## TRADE MEMORANDA.

BLOMFIELD, BRADLEY, and WATSON.

## Home Correspondence.

*Melons.*—I have generally been a most successful Melon grower; last year, however, the crop failed without my being able to account for it. The plants this year were put into the bed on the 1st May, and progressed most favourably. Ten days ago there was an abundant show of blossoms, and everything in favour of a good crop. The surface of the bed has been kept dry, plenty of air given, water withheld—in fact the management precisely the same as in years previous; nevertheless I am again disappointed. Only two of the blossoms set at all, and the fruit a week old is not larger than a Walnut. Some few of the other blossoms appeared inclined to set, seemed to hesitate for a day or two, and then turned yellow. I am completely puzzled how to account for this entire failure, and hope you will be able to throw some light on the subject. I have now cut the plants completely in, and am giving water over the foliage in hopes of getting a second show of blossoms. *R. B.* [Have you not set them before the plants were strong enough to carry them?]

*Fleming's Tar Paint.*—I observe, at page 405, an attack by "L. L., Shrewsbury," on the tar paint I some time ago introduced to the notice of the public. If "L. L." will take the trouble to favour me with his real address, I might perhaps think it worth while to refer him to several respectable parties who have "not failed," and who have not had the tar "washed off." I will undertake more. If "L. L." has really a fire-barrow that takes two men to move it (and I almost conclude from his letter that he found two necessary), I would call to see it as a matter of curiosity, should business at any time lead me to his neighbourhood; when I might, perhaps, convince him against his will that the tar, when properly applied, would be perfectly dry and hard in a few hours, and that it cannot possibly wash off. My mode of killing weeds has also been noticed by "L. L.," and I beg to tell him that in these experiments I have been guided by figures, over which there is no getting; but there is a certain class of people in whose hands the best of plans and implements are useless. *G. F.* [It is evident that the tar *cannot* wash off if it is applied as Mr. Fleming recommended.]

*The late Cheltenham Flower Show.*—As one of the judges at the Horticultural Exhibition at Cheltenham, my attention has been directed to a remark in the *Cottage Gardener*, June 19th, p. 174, which I quote:—"The inhabitants of Cheltenham had a chance of establishing one of the finest shows in England, having the advantage of a heavy subscription. But they farmed the exhibition out to private speculators, who turned out one of the worst schedules that was ever printed, promised the most ridiculous prizes, cut them down after they were fairly won, and were actually threatened with law proceedings before even some of these were paid. It may be improved, but it will never be what it might have been with good management." Such a paragraph, if left uncontradicted, would be a slur on the character of the censors; I take the liberty, therefore, of submitting a statement of the case to you, along with a schedule of the prizes and a list of the

* My correspondent, "Amicus Volucrum," is quite right in his remarks about Buffon, Bechstein, and other speculative commentators on the nightingale. They run riotously wild in their description of his *imagined* song, losing sight entirely of the harmony of his improvised gushes of melody. No person can give any adequate verbal description of the nightingale's song. The happiness of the bird is so perfect, his *abandon* to the inspiration of his muse so complete, that there is *no end* to the variety of his expressed notes.

rules which were put into our hands for our guidance. My fellow judges were Mr. Kemp and Mr. Parsons. It is not our business who arranged the schedule; but you, from your long-standing experience, will be the best judge whether the schedule was "one of the worst ever printed," or whether the prizes were "most ridiculous." We, the censors, considered that the prizes were sufficiently liberal to induce the attendance of some of the first growers within 100 miles, at least (as I believe the Society pays carriage of specimens); and therefore we did not think we should be doing justice to the Society if we awarded all the prizes offered; we therefore, in several instances, withheld the first prize. And if, in doing so, we erred at all, it was in being still more liberal than the articles merited. I do not believe two dozen plants could have been selected from the whole number exhibited that would have been admitted at Chiswick upon any terms. In fact, taking them altogether, I never saw a more indifferent lot at any provincial exhibition; and I have often seen better plants where the prizes did not exceed one-tenth of the value of those offered at Cheltenham. Besides publishing the above paragraph, the disappointed exhibitors have circulated a report that the committee, or their officials, influenced the judges in curtailing the prizes. This is another insult both to our abilities and to our integrity. No honourable judge would allow himself to be guided by anything excepting the printed schedule and the printed rules, and by those alone we decided; it is due therefore to the public, to the committee, the exhibitors, and to ourselves, that we do declare we were not nor would we have submitted to it had the attempt been made—influenced by anything save the schedule, the rules, and our own judgment. The above is a plain statement of the matter. *William Davidson.*

*Rough Plate Glass* (see p. 406).—The result of Mr. Phillips's visit here (Foxborough Hall) was, that he appeared to be quite satisfied that the Strawberry plants were scorched, and not baked, as you supposed. I think you could form no correct opinion from the leaves which were sent to you, and which could only be collected from the muck heap. By the specimen of Hartley's patent plate glass, which Mr. Phillips produced, it was evident that mine was the common rough plate, and not Hartley's patent; this appears to me to be the sole cause of the scorching. There is no flue in my pit, and air was freely admitted all day and night. *Charles Walford, Foxborough Hall, Woodbridge.*——We are at present engaged in investigating several cases where parties ordering from their tradesmen "Hartley's patent rough plate," have been supplied with quite a different article, preparatory to adopting some remedial measure; we consequently sent a gentleman to examine the glass referred to by Mr. Walford, in his letter of the 21st June, and, as we anticipated, the glass was not manufactured by us; and, notwithstanding, the tradesman employed by Mr. W. was instructed to obtain "Hartley's patent rough plate," another description of glass was substituted, as you will see by a square forwarded herewith, taken out of the frame. Being desirous of obtaining legal evidence of similar instances of deception, we shall be happy to receive communications from parties suspecting anything of the kind, with a sample by letter, when, if necessary, we will send a competent person to inspect the glass. *James Hartley and Co., Wear Glass Works, Sunderland, July* 2. [We have seen a sample of the spurious article, which is an ingenious counterfeit.]

*Black Jamaica Pine-apples.*—If the Pines exhibited at Chiswick are to be taken as examples of the varieties generally grown for dessert, it appears to me that gardeners have fallen into error in cultivating the Queen and Providence kinds more extensively than Black Jamaica. This is much to be regretted, for it must be admitted that the Black Jamaica yields to no variety in flavour. I am aware that it is more delicate and difficult to manage than the two above-named varieties, or any other sort with which I am acquainted. But gardeners have surmounted great difficulties in bringing many other plants and fruits to perfection, and why should the Black Jamaica Pine-apple, whose fruit, as I have already stated, possesses such superior excellence, be so long neglected? More assiduity and care are, indeed, needed to produce a handsome fruit of this kind, with a small crown, and weighing 3 lbs., than are required to grow a Queen 5 lbs., or a Providence 9 lbs. But I hear a gardener exclaiming, "Who ever saw a Black Jamaica of any size without a large crown!" This Pine-apple, I know, has the reputation of producing large crowns, which are objectionable; but would not the gardener's skill, if correctly applied, prevent this superabundant growth? This variety is esteemed either in the shape of a winter or summer fruit, for which reason I consider it worthy of especial attention; and I trust that, if Black Jamaica Pines are exhibited at the next Chiswick Show, the Society's judges will signify their approval of this partially neglected sort, by awarding it such medals as fair specimens of the kind may deserve. I would also hint that, if the Horticultural Society gave awards for "best flavoured Pines," more attention would be paid by growers to that important point. All the Pines which I saw at the last show, to which medals were awarded, appeared to me to have been "coddled," and I doubt much if any of them possessed first-rate flavour. *H. B., Llandilo.*

*Buckwheat.*—It seems to be implied in the *Agricultural Gazette*, p. 363, that the grain of Buckwheat is not desirable as food for man; yet in countries where it is largely used it is considered as economical, as particularly favourable to easy digestion, and as being devoid of any medicinal quality. In Russia Buckwheat is served at the best tables as well as at the most homely ones; in Holland the flour of it is preferred for many kinds of cakes and delicate pastry; *wafeln*, for instance, it has been said, cannot be well made of any other kind of flour. The immense quantity of Buckwheat consumed in Russia is usually deprived of its husk in appropriate mills, and the grain is broken as Oats are to make groats in this country; in this state it is called greshna croup. To prepare the greshna croup it is usually put into a deep earthenware pot with water, a little more in quantity (to allow for evaporation) than the grain will absorb; the pot, with its contents, is then kept for two or three hours in a gentle oven heat, by which time the water has been wholly absorbed, the grains of Buckwheat have become perfectly tender, and each one of them dry and distinct, like well-boiled rice for curry; the greshna cassia is served in the pot in which it was cooked, a napkin being rolled round the vessel; fresh butter and salt are stirred into the cassia, which is eaten generally with roast meat, but often alone. For the factory girls at Alexandrovsky the greshna cassia is cooked in large coppers, cold-drawn Hemp or linseed oil being used for them, as for the generality of the people, instead of butter. The nursery breakfast in English merchants' houses at St. Petersburgh is frequently greshna cassia, eaten with milk instead of butter. A very favourite dish at all tables is a kind of raised pie, with greshna cassia in its composition. An ordinary raised pie crust being rolled out, there is spread upon it a layer an inch or more thick of already cooked greshna cassia; along the middle of this foundation is then laid a fish; the cassia, with its supporting crust, is doubled over and properly closed; the pie thus made is baked in a gentle oven. The fish preferred at St. Petersburgh for this purpose is the *beloë riba*, a white species of salmon, which furnishes fat as well as flavour; were the fish of a dry sort it would have bits of butter placed around it. Pies of this nature might be made in England with other kinds of grain; some very *recherché* for a great table, others very economical, but savoury and nourishing, for the humbler classes of our people. *M.*

*Song Birds.*—Mr. Doubleday, in his comments on my remarks on certain birds and their habits, at page 392, has kindly endeavoured to set me right, on one or two points in which he conceives I am in error; but as he did not, in the first instance, peruse the letters containing the precise "questions" to which I replied, he is hardly in a position to take the judge's chair. The bird, about which he speaks so positively as being the redstart, was described to me as resembling the sparrow in form and size, and as haunting a running stream, &c., with other puzzling points. Now, the sparrow (*Passer domesticus*) is far larger, and of infinitely less symmetrical proportions, than the redstart (*Phœnicura ruticilla*), which is 5½ inches long, and a most sleek and elegantly formed bird; nor would it live in cages so happily and contentedly (as my informant told me these birds do in Wales), if it were the bird Mr. Doubleday supposes it to be. Redstarts are very sulky in confinement, and sing "very small." I have at the present time in my possession one of the handsomest I have ever seen. It was caught the very day of its arrival in England, some 4 years ago. Its white sprinkled throat, and snow-white cap, are strikingly beautiful; indeed, its plumage is altogether so. Their haunts, let me remark, are *not* usually running streams,—but gardens, shrubberies, and forests, for the most part, particularly at this season. As for the stone-chat (*Saxicola rubicola*), I have always found them very tender when immured in cages. In their natural wild state, they may be hardy enough, like the redbreast and the wren (*Troglodytes vulgaris*); but even these two latter,—hardy to a proverb, must be kept in an equable temperature if required for song, and to live as "cage birds." Many migratory birds, impatient of confinement, are yet well able to withstand the most rigorous of our English winters, when they have the free use of their wings and live as rovers. As for the monotonous trisyllabic call of the reed sparrow,—I turned a nest of them, when they were quite young, into my aviary; and they acquired in such "mixed company" a very lively, sprightly note,—short indeed, but pleasing withal. I readily admit that Mr. Doubleday's success in domesticating for so long a period the various families of "chats," far exceeds mine. My patience with them has long since become utterly exhausted, and it will never again be called into similar exercise. *W. K., July* 4.

*Viola lutea.*—It seems necessary to call the attention of your readers to the confusion caused by florists and gardeners, who, either through ignorance or carelessness, give to their garden varieties names previously employed for the designation of species. The term placed at the head of this paragraph is a conspicuous instance. No botanist would suppose that the "Viola lutea," of advertisers, and even reports of horticultural exhibitions, is not the native species so called and described under that name in botanical works. That it is not such, however, is well known; but what it really is, the present writer is not informed. Surely the gardener who named it Viola lutea could have found some name of a less ambiguous kind than this, which necessarily leads to confusion. If the plant is a species it probably already possesses a name; but if unnamed it cannot bear the name now given to it. If a gardener's variety or hybrid, it should be named as such, and not in such a manner as to lead to the supposition of its being a species. Let a florist name his flower as florists usually do, not ape the nomenclature employed in scientific botany. Perhaps you will kindly inform your botanical readers what the so-called Viola lutea really is. *C. C. B.* [We do not know.]

*Potato Disease.*—I detected a few spots of disease in a patch of Potatoes here, about 10 days ago, and since that time it has spread rapidly over the whole piece, which is now nearly destroyed. Disease has likewise made its appearance in spots over the whole of my Potatoes, of which I have about an acre. The Ash-leaved which I am now using are excellent, but the haulm is beginning to spot; if the disease continues to spread as rapidly as it has done during these last few days, in three weeks the whole crop will be completely spoiled. The soil is loam on a chalky bottom. *A. S., Slindon, near Arundel, Sussex, June* 30.

*Yellow Roses at the Chiswick Exhibition.*—Mr. Francis's reply to our article on yellow Roses contains incorrect dates, and no portion of his letter argues the question at issue. If Mr. Francis or the judges had offered some rule for the future guidance of exhibitors, it would have been something satisfactory. As to dates, we find that we were awarded a 1st prize in 1849, and disqualified in 1850, the judges stating that our Roses were not yellow, and allowing Mr. Terry to take the prize for six sorts which were said to be yellow. In 1851, however, Mr. Francis is awarded a prize for six cut yellow Roses, which, on the aggregate, had less pretensions to yellow than those in pots, for which we were disqualified in 1850. This is the point on which we feel aggrieved; and we ask if it is fair that a prize should be given for the same Roses (in a cut state, be it remembered) that we showed in pots and were disqualified with? Mr. Francis wishes your readers to believe that pale cream colours were inadmissible only in 1850, but facts are stubborn things. Referring to that part of the schedule of prizes which relates to Roses, we find it worded the same in 1849, 1850, and 1851; and yellows placed under the head "to be grown in pots." The exact words are these: "No. 5. Yellow Roses, best six varieties. N.B. To be really yellows, pale cream colours inadmissible." Mr. Francis will have some difficulty, therefore, in inducing us to believe that Elise Sauvage and Smith's Yellow were pale cream-coloured in 1850, and really yellow in 1851! *H. Lane and Son, the Nurseries, Great Berkhampstead.* [This seems to us to be a mere question whether the judges have attended to the directions given in the schedule. If Mr. Francis or Mr. Lane, or any other grower, has at any time produced cream-colours as yellows, they ought to have been disqualified.]

## Societies.

ROYAL BOTANIC, REGENT'S PARK, *July* 2.—A large number of Pelargoniums, a good display of Orchids, many well-cultivated Stove and Greenhouse Plants, good collections of Cape Heaths, and some tall Cacti, were assembled on this occasion, and there was an extensive exhibition of Fruit.

In collections of 30 STOVE and GREENHOUSE PLANTS, the 1st prize was awarded to Mrs. Lawrence, of Ealing Park, for beautiful plants of Allamanda cathartica and grandiflora, Clerodendron paniculatum, Kalosanthes miniata, Ixora coccinea, a white Heath, Rondeletia speciosa, double and single examples of Tabernæmontana coronaria, a very fine blue Leschenaultia, three varieties of Everlasting, the charming Dipladenia crassinoda, Erica tricolor rubra, the Cavendish Heath, Sollya linearis, Pimelea mirabilis, the white-blossomed Ixora, the red and white Vincas, the Long-flowered Exostemma, the lovely Chinese Indigofera decora, and Pimelea hispida.—Mr. Cole's group, which was second, contained two fine plants of Dipladenia splendens, two of Allamanda, and two of Crowea saligna, together with the red and white Vincas, Dipladenia crassinoda, the Scarlet Ixora, Clerodendron Kæmpferi, a very fine white Ixora, insufficiently in bloom; two Everlastings, a noble Lisianthus Russellianus, a handsome bush of Epacris miniata, the scarlet Kalosanthes (K. coccinea), some well-managed Heaths, and Æschynanthus Lobbianus.—A third collection, contributed by Mr. Stanly, contained the Saffron-coloured Ixora, Cyrtoceras reflexum, Kalosanthes miniata, the large-blossomed Epacris, the variety of Erica tricolor called elegans, one or two Everlastings, Pimeleas, and Vincas.—Messrs. Pamplin's exhibition, which was fourth, consisted mostly of small plants, among which were Allamanda cathartica, Euphorbia splendens, Kalosanthes, Vincas, Cape Heaths, and good specimens of Stephanotis floribunda and Pimelea decussata.

In collections of 20 STOVE and GREENHOUSE PLANTS, Messrs. Fraser, of Lea-bridge, were first. Their group contained finely-managed plants of Allamanda grandiflora and cathartica, Pavetta caffra, Dipladenia crassinoda, the Scarlet Ixora, the Diosma-leaved Pimelea, the Sweet Sphenotoma gracilis, Kalosanthes coccinea and miniata, Epacris miniata, Rhyncho-spermum jasminoides, the blue Sollya linearis, Stephanotis floribunda, and Clerodendron Kæmpferi.—The next group, communicated by Mr. Taylor, gr. to J. Coster, Esq., consisted of Allamanda cathartica and Schottii, Stephanotis floribunda, Dipladenia crassinoda, highly-coloured; Sollya linearis, the showy Kalosanthes miniata, a very fine Ixora coccinea, the small pink-flowered Erica pulverulenta, Leschenaultia formosa, the white Sphenotoma gracilis, one or two Everlastings and Azaleas.—Mr Green sent a third group, in which were Allamanda cathartica and grandiflora in beautiful condition, the Scarlet Ixora, the brilliant Epacris miniata, a large Rondeletia speciosa, the extremely handsome Pleroma elegans, a plant which ought to be in every collection; Dipladenia crassinoda, the Cavendish Heath, the violet Tetratheca verticillata, Erica Massoni, admirably grown; the showy Epiphyllum grandiflorum, Leschenaultia formosa, the rose-coloured variety of Aphelexis macrantha, the sweet-smelling Sphenotoma gracilis, and Polygala oppositifolia.

Mr. Speed, of Edmonton, had a handsome group of 10 STOVE and GREENHOUSE PLANTS. They consisted of Allamanda Schottii and cathartica, the white-flowered Schubertia graveolens, Clerodendron fallax, the Java and Scarlet Ixoras, Kalosanthes miniata, a Vinca, Epacris miniata, and Dipladenia crassinoda.—A collection from Mr. Williams, gr. to Miss Traill, contained Polygala cordifolia, two white-flowered Cape Heaths, Leschenaultia formosa, Pimelea Hendersoni, two kinds of Franciscea, the Scarlet Ixora, and the pretty Roella ciliata.—The next 10 were from Mr. Croxford, of Stamford Hill, who produced Allamanda Schottii, large and fine; Clerodendron fallax, the sweet-smelling Stephanotis floribunda, Kalosanthes miniata, a Cape Heath or two, Æschynanthus Lobbianus, Pleronoema proliferum, and Ixora javanica.—Mr. Watson, gr. to Mrs. Tredwell, had Allamanda cathartica, Clerodendron

fallax, a Cape Heath, Kalosanthes miniata, the White-flowered Vinca, Aphelexis spectabilis, the blue Sollya heterophylla, Leschenaultia formosa, the Gledstane Azalea, and the charming variety of Cape Heath called meruleflora bicolor.—From Mr. Hamp, gr. to J. Thorne, Esq., came Hoya imperialis, Stephanotis floribunda, the brilliant Kalosanthes miniata, Allamanda cathartica, the lovely Dipladenia crassinoda, Epacris miniata, and Ixora croeata.

ORCHIDS, as usual, were arranged on one side of a long tent behind the Pelargoniums, and had a good effect. In collections of 25 plants, Mr. Mylam, gr. to S. Rucker, Esq., was first. His plants consisted of a huge Aerides odoratum, loaded with long racemes of lovely blossoms; a large plant of Vanda Batemanni, with two spikes of flowers; Sobralia macrantha, with five blossoms; a magnificent Dendrobium formosum, literally one mass of orange and white flowers; the large white Butterfly plant (Phalænopsis grandiflora); the yellow-blossomed Anguloa Clowesi, the singular Coryanthes macrantha; the twisted Dendrobe (D. tortile), Saccolabium guttatum with four fine spikes of flowers, Cypripedium Lowi, the scarce Huntleya meleagris, Barkeria spectabilis, Aerides maculosum, the Dalhousie Dendrobe, Odontoglossum grande, the rare Phalænopsis rosea, Epidendrum verrucosum, the Moss Cattleya, and the brown and green flowered Cycnoches pentadactylon.—Mr. Franklin, gr. to Mrs. Lawrence, had Epidendrum vitellinum, Stanhopea tigrina, the singular looking Cycnoches Loddigesii, Brassia Wrayæ, the Clowes Anguloa, the large white Butterfly plant (Phalænopsis grandiflora), the Stapelia-like Promenæa, Oncidium ampliatum majus, Aerides odoratum, Oncidium Papilio and Lanceanum, Barkeria spectabilis, the twisted Trichopil, and Odontoglossum hastilabium.—Mr. Williams, gr. to C. B. Warner, Esq., had Peristeria pendula, the Bearded Lady's Slipper (Cypripedium barbatum), Cattleya violacea and crispa, Phalæ opsis amabilis, two plants of Oncidium Lanceanum, Aerides maculosum, odoratum, and roseum; Calanthe Masuca insufficiently in bloom, and the white Calanthe veratrifolia.

A collection of 20 plants, contributed by Messrs. Rollisson, contained a large Dendrobium moschatum, Stanhopea tigrina, a fine pot full of Miltonia spectabilis, the green tailed Dendrochilum filiforme, Cyrtopodium stellatum, Calanthe Masuca, Stanhopea saccata, the rare Aerides quinquevulnera, the large white Butterfly plant (Phalænopsis grandiflora), a well flowered Maxillaria tetragona, and Oncidium luridum guttatum.

In his group of 15 plants, Mr. Blake, gr. to J. H. Schröder, Esq., had a profusely flowered Galeandra Baueri, Aerides affine, two plants of the large white Butterfly plant (Phalænopsis grandiflora), Oncidium pulvinatum, a highly-coloured Odontoglossum citrosmum, Epidendrum cinnabarinum, the Moss Cattleya, Barkeria spectabilis, Stanhopea oculata, Odontoglossum pulchellum, the long-tailed Angræc, and the white-blossomed Aganisia pulchella.

Collections of 10 plants were furnished by Mr. Barnes, gr. to R. Hanbury, Esq., and Mr. Wooley, gr. to H. B. Ker, Esq., of Cheshunt. The former had Aerides odoratum majus, in good condition, Phalænopsis grandiflora, Barkeria spectabilis, well flowered; the charming Saccolabium Blumei, Odontoglossum citrosmum, the tailed Angræc, Vanda teres, Saccolabium præmorsum, S. guttatum, and Aerides maculosum.—Mr. Wooley produced Peristeria elata, a finely-blossomed Cattleya Harrisoniæ, Oncidium pulvinatum, the rare and beautiful Warrea tricolor, Saccolabium Blumei, bearing a fine flower spike, the White Phaius, Epidendrum alatum and variegatum, the Roxburgh Vanda, and Oncidium leucochilum.

Mr. Schröder sent a new Chysis, Messrs. Lane a variety of Stanhopea oculata, Messrs. Veitch Dendrobium albo-sanguineum and a handsome Cypripedium, and Mr. Ker Bolbophyllum Henshalli.

CAPE HEATHS.—Excellent collections were furnished by Messrs. Smith, Cole, Rollisson, Fairbairn, and others. The varieties consisted of Massoni, tricolor elegans, t. Leeana, t. rubra, t. Wilsoni, jubata major, perspicua rosea, inflata, infundibuliformis, depressa, retorta major, Bergiana, ampullacea, Parmentieri rosea, Juliana, Shannoni, jasminiflora, metulæflora bicolor, eximia, Halicacaba, Aitoniana, Savileana, Clousiana, Irbyana (not out), pulverulenta, ventricosa grandiflora (a fine Heath), mutabilis, and obbata.

LISIANTHUS RUSSELLIANUS.—Four or five admirably managed specimens of this showy and, when well grown, really beautiful plant, were produced by Mr. Constantine, of Hillingdon, near Uxbridge.

Among SINGLE SPECIMENS the best were Erica Massoni, from Mr. Smith; a large Dendrobium moschatum, and Luxemburgia ciliosa, from Messrs. Rollisson; Curcuma Roscoeana, from Mr. Ivison, gr. to the Duchess Dowager of Northumberland, at Syon; Vinca rosea, from Mr. Speed; and Medinilla magnifica, from Messrs. Veitch.

NEW PLANTS consisted of a Bejaria from Mr. Ivison; Gloxinea cærulea grandiflora from Messrs. Veitch; a Blandfordia from Mr. Barnes; a hybrid Statice in the way of macrophylla from Mr. Scott; Achimenes longiflora alba, and a white Escholtzia, from Messrs. Henderson; and Nepenthes javanica from Messrs. Rollisson.

The following variegated STOVE PLANTS were furnished by Messrs. Henderson—viz. Paretta Borbonica, Dracæna terminalis, D. t. variegata, Croton pictum, Maranta sanguinea, zebrina, bicolor, and albo-lineata; Dieffenbachia maculata, Caladium bicolor and variegatum, Vitis velutina, Bartolina maculata, Physurus pictus and argenteus, Cypripedium venustum, Clerodendron indicum, Aspidistra lurida variegata, Hoya carnosa picta, Tillandsia zebrina, Eranthemum leuconervium, Tradescantia zebrina, and Campylobtrys discolor.

Messrs. STANDISH and NOBLE, of Bagshot, exhibited the following rare hardy plants: Ilex microphylla, an Ilex something in the way of cornuta, Berberis japonica, a dwarf variety of Cryptomeria japonica, Quercus inversa, Q. sclerophylla, the funeral Cypress—6 feet high, Ilex cornuta, Libocedrus Chilensis, Cephalotaxus Fortuni, Abies Jezoensis, an unnamed Ilex, and Berberis Bealii.

PELARGONIUMS, as we have stated, were plentiful, and in good condition, considering the season. Varieties in 8-inch pots. Nurserymen: 1st prize to Mr. C. Turner, Slough, for Foster's Gipsey Bride, Narcissus, Alonzo, Conspicuum, Hoyle's Nectar Cup, Ajax, Nandee, Beck's Centurion, Emily, Turner's Rowena, Illuminator, and Foquette's Magnificent; 2d, Mr. Bragg, Slough; 3d, Mr. Gaines, Battersea. Amateurs: 1st prize, Mr. Black, gr. to E. Foster, Esq., Clewer Manor, near Windsor, for Foster's Enchantress, Shylock, Monteith, Lavinia, Conspicuum, Spot, Voltigeur, Ariel, Sheet Anchor, Rubens, Pulchrum, and Rouse's Alibi; 2d, Mr. R. Stains, New-road; 3d, Mr. Robinson, Pimlico; 4th, Mr. Cock, Chiswick. 6 plants, in 11-inch pots: 1st prize to Mr. Chapman, Hammersmith, for Forget-Me-Not, Matilda, Negress, Bianca, Rosy Circle, and Cassandra: 2d, Mr. R. Stains.

FANCIES.—Amateurs: 1st prize to Mr. W. Miller, gr. to R. Moseley, Esq, for Jenny Lind, Reine des Français, Oreates, Lady St. Germans, Fairy Queen, and Bouquet tout fait; 2d, Mr. R. Stains; 3d, Mr. Robinson. Nurserymen: 1st prize to Mr. Gaines, for Statuaski, Odoratum magnificum, Triumphans, Queen Superb, Fairy Queen, and Orestes; 2d, Mr. Ambrose; 3d, Mr. Chapman. Certificates were awarded to the Seedling Pelargoniums, Optimum and Purple Standard, varieties that we have described on former occasions.

CAPE PELARGONIUMS were furnished by Messrs. Parker, Stanly, and Stains.

PICOTEES.—1st prize for 12 varieties, to Mr. C. Turner, for Mary (Dodwell), General Bem (Read), Cleopatra (May), Prince Arthur (Fellows), Miss Burdett Coutts (Burroughes), Duke of Rutland (Holyoake), Constance (May), Beatrice (May), and 4 Seedlings; 2d, Mr. Willmer.

CARNATIONS.—1st prize for 12 Carnations, to Mr. C. Turner, for Romeo (May), Prince Albert (Hale), Blondel (Puxley), Count Pauline (Holmes), Cradley Pet (Wallis), Lord Byron (Taylor), Voltigeur (Cheetham), Percy (May), Cardinal Wolsey (May), Omnium Primum (Kaye), and 2 Seedlings; 2d, Mr. Willmer.

PINKS were shown very large and fine, and in tolerable quantity for July: 1st prize for 12 varieties to Mr. C. Turner, for Optima (Turner), Great Britain (Ward), Goliath (Hillyer), Lola Montes (Costar), Sappho (Colcutt), Narborough Buck (Maclean), Diana (Smith), Lord Valentia (Kirtland), Spark (Turner), Criterion (Maclean), Huntsman (Smith), and Whipper-in (Smith); 2d, Mr. Bragg; 3d, Mr. J. Edwards.

PANSIES.—1st prize for 24 varieties to Mr. C. Turner, for Constantine (Turner), Bellona (Hooper), Duke of Perth (Handasyde), Sambo (Hale), Mrs. Coleridge (Turner), Queen of England (Fellows), Lord Jeffrey (Blanche), National (Turner), Swansdown (Turner), Disraeli (Hunt), Mrs. Beck (Turner), Black Diamond (Turner), and 11 Seedlings.

FUCHSIAS.—These consisted of Acantha, Cassandra, Exoniensis, Dr. Jephson, Elizabeth, Sir R. Peel, Exquisite, Crimson King, Duke of York, Star, Cavalier, Dr. Grosse, Shylock, Magnificent, Lord Nelson, Dr. Smith, Beauty of Leeds, and Pearl of England. Mr. Turner showed a good light Seedling, called Conspicua.

CALCEOLARIAS were shown by Mr. Gaines and Mrs. Lawrence. The sorts were Amœna, Desperanda, Mary, Magnifica, Standard, Baron Eden, Earl of Rosslyn, Chieftain, Lady Flora, Duke of Rothsay, Rosalind, and Catherine Seaton.

TALL CACTI were produced by Mr. Green; the sorts were Epiphyllum formosum, Jenkinsoni, Greenii, mexicanum, rubrum cœruleum, and aurantiacum.

CUT ROSES were exhibited in great profusion and variety by Messrs. Lane, Paul, Francis, Terry, Rowlaud, and others. Among them we remarked splendid boxes of Paul Ricaut, Géant des Battailles, and Devoniensis. They maintained their freshness well throughout the day, and formed a very attractive feature of the show.

Among MISCELLANEOUS SUBJECTS, the more prominent were collections of Ferns, Lycopods, and white Lilies (L. longiflorum and eximium). In his group of Ferns, Mr. Wooley sent two exceedingly well-managed plants of Adiantum trapeziforme and Asplenium cicutarium. Mr. Williams had also good exhibitions of this interesting tribe of plants.

FRUIT, as we have stated, was plentiful and good. Many of the white Grapes, were, however, unripe. Among Pine-apples there was nothing particularly striking. The best Providence came from Mr. Bray; it weighed 7 lbs. 12 oz. Second prizes were awarded to Mr. Ewing, Mr. Turnbull, and Mr. Collinson, for good examples of this kind of Pine-apple. Collections of six sorts were shown by Mr. Bray (1st) and Mr. M'Ewen (2d). These were chiefly Queens. As single Queens, examples were shown by Mr. Jones (1st), Mr. Brewin and Mr. Bray (equal 2d), and Mr. Constantine. For single fruits of other varieties, prizes were taken by Mr. Drummond and Mr. Turnbull (equal), and Mr. Frost (3d).

GRAPES.—In the class of three dishes of distinct varieties, the first prize was taken by Mr. M'Ewen, gr. to the Duke of Norfolk; and the second by Mr. Henderson, gr., Coleorton Hall. In collections of not less than 12 lbs., of any kind, there were 14 competitors. The best of these came from Mr. Thompson, gr. at Wrotham Park, and consisted of beautiful Muscats. The next best were those of Mr. Mitchell, of Brighton, who had Black Hamburgh. A sample of equal merit was shown by Mr. Davis, of Oak-hill, the sort being Muscat of Alexandria. Mr. Spar, of Brighton; Mr. Head, Worthing; Mr. Harrison, Oatlands Palace; Mr. Harrison, Chertsey; Mr. Mackie, Kingston Hall; Mr. Munro, Colney House; Mr. Eaton; Mr. Bray, Sidmouth; and Mr. Moffat, Cumber, were all exhibitors in this class, producing Black Hamburghs—except the latter, who had Sweetwater.—For a single dish of three bunches of Black Hamburgh—first prizes were taken by Mr. Heywood, Rounday, Leeds, and Mr. Forbes, gr. to the Duke of Bedford, both samples being well swelled and coloured; 2d prizes were taken by Mr. Slowe, Bayfordbury, and Mr. Foggo, gr. to the Marquis of Abercorn; 3d prizes were awarded to Mr. Henderson, Coleorton Hall; Mr. Davis, Oak-hill; and Mr. Morrison, gr. to Lord Harrowby. The other competitors were Mr. Stent, Mr. Mitchell, Mr. Jackson, Mr. Taylor, Mr. Dytch, Mr. Munro, Mr. Robertson, and Mr. Silverlock. Mr. Turnbull had a good sample of West's St. Peters, for which a bronze medal was awarded. In the class of white Muscadines or Sweetwaters, the best sample was shown by Mr. Williams, gr. to C. B. Warner, Esq.; the next best by Mr. Mackie and Mr. Snow, gr. to Earl de Grey. Of Muscats there were four beautiful samples, the best of which were shown by Mr. Taylor; the next belonged to Mr. Thompson, while small silver medals were taken by Mr. Turnbull and Mr. Mitchell. A bronze medal was awarded to Mr. Henderson for a good example of Chasselas Musque, and one of the same value to Mr. Judson, for a dish of the Richmond Villa Black Hamburgh, as having been introduced within the last seven years.

PEACHES.—In the class of one dish of six fruit there were four contributors. The best were those of Mr. Collinson, gr. to the Marquis of Westminster. The next best were from Mr. Thompson, Wrotham Park, who showed Royal George.

NECTARINES.—The best came from Mr. Davis, of Oak-hill, the sort being Elruge. The next best were from Mr. Graham, gr. to Mrs. Smith, to whom a bronze medal was given, and certificates were awarded to Mr. Reikie, gr. to Lady Hunter, and also to Mr. Collinson. Mr. Smart, Mr. Hill, and Mr. Robertson were also competitors.—In 4 dishes of distinct varieties, the first prize was awarded to Mr. Turnbull.—In the class of 2 dishes there were nine competitors, the best samples being those of Mr. Snow (1st), Mr. Collins, and Mr. Davis, gr. to G. Dixon, Esq. (equal 2d). A bronze medal was awarded to Mr. Hill, Keil Hall, Staffordshire; and certificates to Mr. Mitchell, gr. to Lord Shannon, Castle Martyn, Cork; and to Mr. Smy, gr. to Sir T. Cullum, Bart., Hardwick House. The others in this class were Mr. Foggo and Mr. M'Ewen.

CHERRIES.—Of these four samples were shown, the principal sorts being the Circassian, from Mr. Gainsford, to whom a bronze medal was awarded. An equally fine sample of the Elton, came from Mr. Snow, to whom a certificate was also given for a dish of Knight's Early Black. Others came from Mr. Bray, Sidmouth.

MELONS.—The best green-fleshed varieties were from Mr. Mitchell and Mr. Robinson (equal). The second best were shown by Mr Phillpotts and Mr M'Ewen (equal), and the third by Mr. Inwood, Mr. Fleming, and Mr. Chapman (equal). Mr. M'Ewen and Mr. Stains received prizes for scarlet fleshed.

STRAWBERRIES.—In the class of two dishes there were five competitors, and the same number in that for four dishes. The samples were generally well grown, the sorts being chiefly the British Queen and Keens' Seedling. The awards in the first class were, Mr. Kitley (1st) and Mr. Munro (2d); and in the second, Mr. M'Ewen (1st), Mr. Lydiard (2d), Mr. Munro (3d), and Mr. Wells (4th). Mr. Cuthill, of Camberwell, had fine examples of his Black Prince.

MISCELLANEOUS COLLECTIONS.—The best was sent by Mr. Fleming, gr. to the Duke of Sutherland, at Trentham. This included a finely grown Ripley Queen Pine-apple; three large bunches of Black Hamburgh Grapes, Royal George and Noblesse Peaches, three Melons, and a dish of May Duke Cherries. The next in point of merit came from Mr. M'Ewen, Arundel Castle, and included some beautiful Circassian Cherries, Royal George Peaches, Elruge Nectarines, and Black Hamburgh Grapes. Mr. Chapman, gr. to J. B. Glegg, Esq., took a third prize for a similar collection.

Mr. Hunter, gr. to N. Clifton, Esq., 38, Cross-street, Islington, had a brace of very fine Cucumbers. They measured 30 inches in length, and quite 7½ inches in circumference, both fruit being straight and even. The variety was a white spine, called Hunter's Prolific, and was stated to have been grown in a Polmaise stove, which Mr Hunter has found to answer perfectly every purpose to which it has been applied.

We may take this opportunity of stating that the Rose exhibition, from which so much was expected, has proved all but a complete failure. Speaking of it to one of our largest Rose growers, who is himself a contributor to it, his remark was "it's just passable." We, however, go further, and say that it is "not passable;" as a whole it makes little display, and the blooms individually are so poor and bad in colour that they convey an incorrect idea of the varieties they represent. Such a project, we expect, will never be attempted in the neighbourhood of London again.

GREAT MARLOW HORTICULTURAL, *June* 24.—There was an interesting meeting on this occasion, and many prizes awarded; but we have only been furnished with a list of the awards, without the names of the subjects for which they were given.

## Notices of Books.

*Zur Morphologie der Monokotylischen Knollen-und Zwiebelgewächse; von Thilo Irmisch.* Berlin. 8vo, 1850; pp. xxii. and 286., tab. 10.

THE volume before us is a very welcome storehouse of information, for though many scattered treatises, and some of great merit, exist respecting the structure of bulbs and tubers, there was not previously any grand collection of facts to which the botanist might at once refer with the reasonable hope of finding the desired information. The species examined are mostly of common occurrence either in the field or garden, a circumstance which affords the ready means of verifying the correctness of the information which the work supplies, and the justice of the inferences which have been formed. It is highly probable that the author's researches will be extended to a wider field, which may be expected, particularly in the examination of more tropical forms, and of dicotyledons, which though not entirely passed by, have formed rather an incidental than an especial object of research, to yield many circumstances of interest; but, above all, he gives us reason to hope that the process of germination and subsequent growth may be observed in cases where it is possible to do so with the attention it deserves, and that thus the whole history of the development of the buds of succession, and their proper connection with the formation of bulbs and tubers, may be placed clearly and completely before the botanist. A solid foundation has already been laid in the description and figures of this excellent treatise. Above 80 species have been well examined, and of their bulbs and tubers under various forms and circumstantial details, no less than 400 figures appear in the 10 plates which accompany the volume, and which present everything that can be desired on the score of clearness, precision, and accuracy. The individual descriptions occupy three quarters of the volume, the remainder being taken up with the general conclusions and explanations of the figures. The arrangement at which the author has arrived may be briefly stated as follows. The productions in question may be considered as forming two distinct divisions, tubers and bulbs, the word tuber being taken in a wider sense, so as to include tubercles. The first may be divided into two classes—

1. Those which may be considered as formed of a portion of the stem.

2. Those which are evidently of the nature of the roots.

The first admits of two divisions, one containing those examples in which the tuber is fully formed previously to the bud or buds which it is destined to support, and belongs to the same axis with them as in the common Potato; or to take an instance from Monocotyledons, where they are very rare, *Cyperus esculentus*. The second division comprises those cases in which the tubers are perfected, after the other parts which belong to the same axis with them, so that both they and the buds which they are destined to nourish belong to two different axes, or, at least, to two different offsets, or shoots of one axis. In this division belong *Sturmia, Malaxis, Arum maculatum, Colchicum, Crocus,* and *Ranunculus bulbosus.*

The radical tubers comprise two similar sections. To the first belongs *Orchis,* and other bituberate genera; to the second *Spiranthes,* the two divisions being exactly equivalent to those of the tubers formed from the stem.

Bulbs also admit of a like classification: a first group consisting of *Tulipa,* some species of *Allium, Iris Xiphium, Tigridia pavonia,* in which, after the flowering stem is perfected, the old bulb dies away completely, and has nothing to do with any future bud. The second section consists of two subsections, in one of which (α), containing such plants as *Galanthus nivalis, Fritillaria Meleagris* and *imperialis, Ornithogalum umbellatum,* &c., the scales of the bulb of the previous year survive everything of that year, except that portion of the axis on which the new bulb is formed, and which maintains the connection between it and the old bulb, destined to support the bud of the current year. In the other (β), the new germ is supported by the bulb of the penultimate year, or even of the year or years preceding that. Examples are afforded by such plants as *Ornithogalum nutans, Hyacinthus orientalis, Lilium martagon* and *bulbiferum, Leucoium vernum, Narcissus Pseudo-Narcissus,* and *Amaryllis formosissima.* It is not to be supposed that these distinctions admit always of mathematical precision, as intermediate forms occur. They will, however, be found practically correct.

The author does not appear to have satisfied himself as to the proper nomenclature to be used in descriptions; and it is obvious that no good general nomenclature can be derived from the examination of a single class of plants. "The tubers and bulb of the first se

tion," he says, "might be called *bulbi annui, tubera annua;* the tubers of the second section, and the bulbs of the subsection (*a*), *biennes,* and the bulbs of the subsection (*β*), *perennes;* but if objection be made to talking of a perennial plant, with an annual or perennial bulb, the word *prævenions* or *præventitius* may be applied to the productions of the first section; the second section will then contain *bulbi relicti,* or *tubera relicta* (*postvenientia*), and bulbs of the subsection (*a*) and (*β*) may be marked by the additions of *unius anni* or *plurium annorum.* We must pass over the critical examination which follows of the views of previous authors. This, however, we the rather do, as, together with a great part of the general remarks, they have been given to the public by Mr. Henfrey in an English form in his "Botanical Gazette." It is, however, to be regretted that in this, as in some other of his translations, he adheres so closely to the idiom of the original, as not only to make them unpleasant to read, but even to render the meaning extremely difficult, though the sense of the author is, as far as mere words are concerned, correctly given. Where the German is occasionally hard enough, when translated into so many equivalent words, it becomes positively obscure without reference to the original, which is manifestly a fault to be most carefully avoided.

It is with great pleasure that we observe that the work is quite free from the mystification which is so common in German authors; all is straightforward enough, and we trust that this and some other works which have lately appeared in Germany, are proof that Okenism is getting out of fashion.

Before concluding we cannot help drawing the attention of our readers to the interesting memoir of M. Clos in Annales de Sc. Nat. for Jan., 1850, on the *collum* or space between the ascending and descending axes. He does not, indeed, always take the same view as Irmisch; and when he differs, is sometimes, we think, clearly incorrect; for instance, he considers the *cormus* of Crocuses as a true bulb; but if this be the case, a Palm trunk must be a bulb too; the tubercles of *Cyclamen* he regards as belonging to the *collum,* and not being true stems; and the tubers of *Orchis,* in contradiction of their intimate structure and mode of development, as leafless branches, though those of *Spiranthes* are looked upon as roots. The paper, however, is well worth reading in connexion with the larger work of Irmisch, though it is confined to tubers. It may be useful to give M. Clos' arrangement, which is not without interest, especially as Irmisch has confined himself to the tubers of Monocotyledons.

1. *Tubera radicalia.* Tuberous roots, as Carrots, Beet-root, &c., known by the regular series of rootlets which spring from their surface.

2. *Tubera colli,* as *Corydalis cava, Cyclamen.* Void either of leafs or rootlets on their surface. Root springing from their base.

3. *Tubera radicalia et colli.* Radish. Rootlets distributed regularly over the lower portion only, terminated above by the Cotyledons.

4. *Tubera hypomerithallia. Begonia, Orchis.* Origin axillary; formed of a branch void of leaves and rootlets.

5. *Tubera monomerithallia. Tamus communis.* Base not prolonged into a root, no leaves, or regularly disposed rootlets.

6. *Tubera polymerithallia.* Potato. Comprising many internodes.

7. *Tubera adventitia. Spiranthes. Œnanthe fistulosa.* Formed from adventitious roots.

8. *Tubera lenticellaria. Lupinus* and many *Leguminosæ.* Scattered tubercular bodies, either on the roots or rootlets. These are described by Bivona Bernhardi, and after him by Fries, as fungi, though we think most decidedly without reason.

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

Discontinue stopping the shoots of Vincas, Euphorbias, Poinsettias, Gesneras, Eranthemums, and other plants of similar habit, which are designed for autumn or winter flowering; and attend duly to potting, watering, and regulating the heat and moisture. Plenty of light and air are indispensable for the ripening of the shoots of these and other plants grown for the same purpose. Amongst these, one of the most useful is the Linum trigynum, which produces large clear yellow flowers in great abundance throughout the winter. As the tender kinds of greenhouse plants complete their growth, they may be set by themselves in houses or frames, of which the sashes can be easily put on or removed. In such a situation, they can be freely exposed to the sun and air, but at the same time may be covered when the weather is excessively wet. In staging the plants, they should be so arranged as to shade only the pots of those which are behind them. The hardier kinds of greenhouse plants may be set in the open air without any kind of shading. It is a great mistake to place established plants behind a north wall during any portion of the summer, as if they were taken their season of repose; but on the other hand, it is essential that the pots be protected from the sun. When the plants are necessarily put out of doors during this season, they should be plunged in beds of sifted coal ashes, taking care to place them far enough apart to ensure a free circulation of air amongst them. The training of conservatory climbers should be regularly attended to, avoiding looseness or negligence, but still leaving them to hang in graceful festoons from the roof. Maintain the plants in a healthy vigorous state, by occasional waterings with liquid manure, as it is important by every possible means to provide an extensive in-door display of floral beauty for the late autumn months, so as to compensate in some measure for the sudden prostration which will then take place in the open garden. Use the syringe more sparingly, except in very fine weather; and at all times apply it early enough in the day to allow the superabundant moisture to pass off before night. Propagate choice Calceolarias, Cinerarias, &c., by cuttings or offsets from the old plants, taking care that they are free from the green-fly or other insects. Make another sowing of Chinese Primulas, to flower in small pots.

FORCING DEPARTMENT.

Pineries.—Having selected, to meet the demand in winter and early spring, those plants which are now showing or flowering, and those which shortly promise to do so, a portion of the strongest and best-rooted of those remaining should be picked out to succeed them; these should be potted immediately, if they require it, and grown on steadily without any check; any of the smaller plants which are in immediate need of potting should also be attended to. Keep up an uninterrupted succession, by planting a few suckers occasionally in a brisk bottom-heat. Where the planting-out system is practised, there is no difficulty in keeping up the succession, if all vacancies are filled up as they occur, with the best plants that can be selected.

Vineries.—As the Black Hamburgh Grape is so liable to shrivel after it is ripened, and as it is thereby deteriorated in quality, it is advisable to shade them during very hot sunshine. Where the crops are swelling, let the state of the borders be frequently examined, especially those which are covered with tarpauling or other material. If the soil is dry, let the surface be carefully loosened with a fork, and watered with liquid manure. Examine the bunches of swelling crops, thin crowded clusters, and remove any small berries, which will spoil the sample if allowed to remain.

Peach Houses.—Admit a free circulation of air through all the houses during fine weather; but where the fruit is just ripening, ventilation during the night and in damp weather should be effected by means of the front, keeping the top sashes closed, to prevent damp cold dews from settling on the fruit. The foliage in the early houses should be kept in a healthy state as long as possible by syringing, and guarding against insect depredators.

FLOWER GARDEN AND SHRUBERIES.

Remove suckers from Rose trees, and stop all gross shoots on the summer flowering kinds. Employ mulching as a means of protecting the soil against evaporation during summer, and especially round standard Roses and other choice shrubs, whose leaves afford little or no shade. Leaf-mould, thoroughly rotted dung, or short Grass, are well adapted as materials for this purpose, particularly the two former, as the soluble ingredients contained therein will be washed downwards in showery weather. After finishing the propagation of Pinks and Carnations, by pipings and layers, proceed with other hardy herbaceous plants, as Phloxes, Pansies, Wallflowers, Antirrhinums, Pentstemons, &c., all which will strike under handlights with the greatest freedom; or even without such assistance, if a shady situation is chosen, and watering is carefully attended to. It is of the first importance to propagate these plants as soon as possible, as time is thereby gained to allow of their being pricked out into nursery beds, where they soon become thoroughly established, and are enabled to endure the winter with very slight protection. The old Linum flavum makes a good yellow bed, continues in flower all the summer, and is perfectly hardy; it will strike freely if the cuttings are taken before the wood gets too hard. Sow Brompton and Queen Stocks for spring flowering, and intermediate Stocks for autumn. A sowing may also be made for late autumn flowering of some of the hardier annuals, which come very quickly into a flowering state. Very much may be done towards stimulating the growth of weakly plants, and assist the flowering of healthier ones by frequent waterings of liquid manure. It is an expeditious and immediately successful mode of increasing the fertility of the soil. Perhaps the flower-garden does not possess more beautiful ornaments during early summer than the Ayrshire and evergreen Roses, worked high on standards, with their branches allowed to hang down, as Nature dictates. This will be a hint to those who are budding Roses, to select some of the tallest stocks for this purpose; or, if none of their stocks are large enough for this season's work, some of the strongest should be left unbudded, so that by pruning and liberal treatment, sufficiently high stems may be secured against the proper time next year.

KITCHEN GARDEN.

If Asparagus beds are liberally supplied now, and during the next month, with liquid manure from the farm-yard, or soap-suds from the laundry tank, with common salt added, it will effect wonders in the way of improving the size and quantity of next year's crop. Asparagus seedlings should be thinned, and the ground kept in a loose state about the young plants. If well attended to, and watered with rich water, with a little salt added, it is wonderful how rapidly they will advance. Sow Early York Cabbages for transplanting, thick, to draw as Coleworts for autumn use, taking care to adopt effectual means for protecting the seed from the depredations of birds. Sow also a bed of Parsley for late autumn and winter use, upon ground which has received a rich dressing of soot and well-rotted manure. Let no pains be spared to obtain a good stock of material for Mushroom beds, to succeed the open fields in supplying this delicacy. Horse droppings are to be preferred for this purpose; but if a sufficient quantity of these is not procurable, the excrements of sheep or deer may be mixed up with them. Until as much is collected as will make up a bed of the required size, let them be spread very thinly on the floor of a dry airy shed, and turned once a day to prevent fermentation from taking place.

State of the Weather near London, for the week ending July 3, 1851, as observed at the Horticultural Garden, Chiswick.

| June and July. | Moon's Age. | Barometer. | | Temperature. Of the Air. | | | Of the Earth. | | Wind | Rain. |

## Notices to Correspondents.

Ants: *C L H.* Plunge the tub in water—in a pond if you please. Let the tub remain under water for an hour. Then wash all the earth off the roots, so that they may be quite clean, and then repot in earth in which there are neither ants nor ants' eggs. Take care that the ants do not escape into the branches of the tree, and then come back again.

Auricula: *P C, Ireland.* The colour of the outer ring or edging is that which constitutes the class to which Auriculas are referred by florists—as green, grey, and white edged: an outer ring of *green,* a ring of *ground colour,* then a ring of *paste,* and a centre or *eye,* all bearing due proportion to each other, form the standard of excellence by which the value of a variety is determined.*

Birds—The "Stone-Chat;" *G L.* At page 392, we answered several queries put by our correspondent, with reference to certain birds. The correctness of one of our replies has since been called in question,—we mean that concerning the stone-chat. "Bechstein," however, to whom we have since had the curiosity to refer, more than confirms what we then stated. Speaking of the *whin-chat,* he says: "This is a *delicate* bird. * * It arrives at the commencement of May, and leaves us about the end of September. When caught, it is scarcely possible to induce them to eat." Of the *stone-chat,* he remarks: "This bird leaves us in September, and returns at the end of May. In habits it resembles the preceding bird. Being a *very delicate bird,* it requires to be fed upon nightingale's food, when in confinement." In calling it a "tender" bird, therefore, we appear to be fully justified. We have always found it so. *W. K.*

Books: *P C Ireland.* "English Botany," Sowerby's "British Fungi." Both are very costly works; there neither is nor can be cheap works on such subjects.—*G O L.* The first volume of the cheap edition of "English Botany."—*A B.* Sanders's "Practical Treatise on the Culture of the Vine."‡ —*Const Reader.* Loudon's "Suburban Gardener," Do. "Encyclopædia of Architecture," and Downing's "Designs for Cottage Residences," an American work.

Glass: *S.* Hartley's patent rough plate. The sides had better be glazed with the same material.‡

Names of Plants: *A H.* Escallonia macrantha.—*C E A.* There is no plant or flower called "Demerary," and we have no idea what the name can possibly represent.‡—*Sub.* Justicia carnea.—*F W L* The specimens are not in a state to be exactly named. They appear to be as follows: 1, Lyonia arborea; 2, Vaccinium frondosum; 3, Vaccinium (?); 4, Vaccinium fuscatum; 5, Andromeda axillaris; 6 (?). Plants cannot be named without flowers.—A few inquiries stand over for further consideration.

Plants in Dwelling Houses: *Enquirer.* Those give off most oxygen that grow fastest, provided they have as much light as others that grow slower. But it is useless to seek for a solution to this inquiry, because no plants will grow fast in dwelling-rooms, if the rooms are to remain habitable. The best are those which are scentless and succulent.

Pruning: *H.* This is a good time enough for taking off large branches from Oak and Elm trees, but we prefer mid-winter.

Seedling Strawberry: *J T, Limpley Stoke.* A good-looking well-flavoured fruit, resembling the round white Carolina, but having considerably more colour than that variety usually possesses.

Vinery Lights: *G O L.* Copper wire rope is what is sometimes employed for moving Vinery lights of great weight.

Vines: *Constant Reader.* Luxuriant growth and a damp atmosphere have caused the small green excrescences to appear on your Vine leaves. They do no harm.

Woodlice, &c.: *C E A.* A little attentive observation will soon show you the kind of injury they commit. A toad or two kept in your hotbed will thin them.‡

SEEDLING FLOWERS.

Calceolarias: *A P W.* Labels mixed, and therefore we cannot distinguish them by name; buff mottled with dark crimson is a pleasing flower of good shape, but a little rough. White motted with chocolate is large and showy, but deficient in shape. Lemon ground with dark brown blotch, finely streaked with yellow, too small, but a break in the right direction. The others are prettily marked, but possess little novelty.*

Pansies: *A J.* 1, yellow and chocolate; a fine large variety, which will make a good show flower; the best of the lot. 2, large, rich, dark self; the indentation on the bottom petal prevents it from being first-class. 3, straw, with blue top petals; same shade of blue on the side and bottom—rather coarse. 4, orange ground colour, with rich red bronze top, lower petals belted with the same; good. 5, white and blue; thin and poor. 6, two shades of yellow for ground colour, and notched on the bottom petal; fine eye; it may come better earlier.*

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—WINDSOR MEETING, 1851.

PROGRAMME.

FRIDAY, JULY 11.—Cattle received into the Show Yard, in the Home Park, from Eight o'clock in the Morning until Eight at Night.

SATURDAY, JULY 12.—The Show Yard open for receiving Cattle from Eight o'clock in the morning until Four in the afternoon; after which latter hour no Stock will be received.

MONDAY, JULY 14.—The Judges will enter the Show Yard at Nine in the morning, and commence their examination of the Stock.—In the afternoon, or evening, when the Judges have delivered in all their awards, Members of Council and Governors of the Society will be admitted into the Show Yard, on the payment of Two Shillings and Sixpence each, and the public at Ten Shillings each.

TUESDAY, JULY 15.—The Show Yard open to the public from Six o'clock in the morning until sunset, at Five Shillings for each person.

WEDNESDAY, JULY 16.—The Show Yard open to the public from Six o'clock in the morning until sunset, at Two Shillings and Sixpence each person.—The Great Dinner of the Society in the Pavilion, at Four o'clock in the afternoon.

THURSDAY, JULY 17.—The Show Yard open to the public from Six o'clock in the morning until Eight at night, at One Shilling for each person.—At Nine o'clock, P.M., the Cattle may be removed from the Show Yard.

FRIDAY, JULY 18.—The General Meeting of the Society, in the Guildhall, at Ten o'clock in the forenoon.

The Show Yard and Pavilion are situate, by the gracious permission of Her Majesty and His Royal Highness Prince Albert, in the Home Park, immediately below the slopes and terraces of the north front of Windsor Castle.

*President*, His Grace the DUKE OF RICHMOND, K.G.

*Stewards of Departments:*

| | |
|---|---|
| Cattle ... ... ... | Mr. Stokes, Mr. Jonas, Mr. Milward. |
| Finance ... ... ... | Colonel Challoner, Colonel Austen. |
| Sale of Tickets ... ... | Mr. Wilson, of Stowlangtoft. |
| Receipts and Admission to Show Yard. | Mr. Raymond Barker. |
| Pavilion Dinner ... ... | Hon. Robert Henry Clive, M.P., Sir John V. B. Johnstone, Bart., M.P., Mr. Shaw of London, Mr. Villiers Shelley. |
| General Arrangement of Show. | Mr. Brandreth Gibbs. |

By Order of the Council,
London, June 11, 1851. JAMES HUDSON, Secretary.

By the Regulations of the Society, all persons admitted into the Show Yard, or other places in the temporary occupation of the Society during the Meeting, shall be subject to the Rules, Orders, and Regulations of the Council.

PAVILION DINNER TICKETS.—Members may obtain their Tickets for the Pavilion Dinner by enclosing a Post-office order for Ten Shillings to the Secretary of the Society, at No. 12, Hanover-square, London, between the 20th of June and the 5th of July. The Tickets will be forwarded by return of post, in the order of application; and should any remain unclaimed they will be sold at the Finance Rooms, within the Society's Enclosure in the Home Park, on the Monday, Tuesday, and Wednesday of the week of meeting, until disposed of. Each of these Dinner Tickets also entitles the holder to a pint of port or sherry.

SUBSCRIPTIONS.—For the convenience of Members attending the Meeting, the Finance Committee will, in the same Rooms, also receive any Subscriptions that may be due from Members to the Society.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.

HENRY KER SEYMER, Esq., M.P., Chairman.

JOHN VILLIERS SHELLEY, Esq, Deputy Chairman.

Empowered by Act of Parliament to execute all works of drainage (including outfalls through adjoining estates), to erect farm buildings, and carry out every kind of permanent improvement upon estates under settlement; to provide the money, or to enable the landowner to employ his own capital and execute the works by his agents, and to secure repayment of the outlay by a charge on the property improved, spread over a number of years. Applications to be addressed to Offices, 52, Parliament-street, London. W. CLIFFORD, Sec.

ROYAL AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.—The ANNUAL MEETING and GREAT NATIONAL CATTLE SHOW of this Society, will take place this year in Dublin, at the Royal Dublin Society's Premises, Kildare-street, on WEDNESDAY, AUGUST 13TH, and the days following, on which occasion ONE THOUSAND POUNDS and upwards, including the Challenge Cup and Medals of the Society, will be offered in premiums for Cattle, Horses, Sheep, Swine, Poultry, Dairy Produce, Flax, and Agricultural Implements, the particulars of which, together with Prize Sheets and blank forms of Entry, can be had on application to the Secretary.

Monday, the 21st of July, will be the last day for lodging notices of Entry for the Show, after which day none can be received.

All Implements must be in the Show Yard on or before Monday, the 11th of August, as the Judges will commence their inspection on Tuesday morning early.

All Stock and other articles, except Horses, must be in the Show Yard before 6 o'clock on Tuesday, the 12th of August, when the gates will be closed.

Arrangements are in progress for the conveyance of Stock and Implements, duly entered for Exhibition, by Steam Boats and Railways, to the Show, the particulars of which shall be communicated on application.

Signed by Order, EDWARD BULLEN, Secretary.
Society's Rooms, 41, Upper Sackville-street, Dublin.

YORKSHIRE AGRICULTURAL SOCIETY.—The Fourteenth Annual Meeting will be held at Burlington, on the 6th of AUGUST next. The ENTRY CLOSES on the 23d of JULY. Free transit of Stock, both ways, and half rates for Implements, are conceded by the Railways of the district. PRIZE SHEETS, for Stock, Implements, or Poultry, with Forms of Certificate, may had, free, by application to Sowerby, Thirsk. M. M. MILBURN, Secretary.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | |
|---|---|
| Clover Manure, per ton ... ... ... | ...£11 0 0 |
| Turnip Manure, do. ... ... ... | ... 7 0 0 |
| Superphosphate of Lime ... ... | ... 7 0 0 |
| Sulphuric Acid and Coprolites ... | ... 5 0 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 10*s.* per ton; and for 5 tons or more, 9*l.* 5*s.* per ton, in dock. Sulphate of Ammonia, &c.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9*l.* 10*s.* per ton, or 9*l.* 5*s.* in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.
40, Bridge-street, Blackfriars, London.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parti s from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

HOSE FOR LIQUID MANURE, Fire-engines and agricultural purposes, made of canvass, lined and coated with gutta percha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure; it is extensively used at the Government public works, also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

ANTHONY'S PATENT AMERICAN CHURN has obtained a Prize at every Agricultural meeting at which it has been exhibited; and the Proprietors have sold upwards of 2000 in one year, and received from all parts of England the highest testimonials in its favour both as to the short time required, the quantity and quality of the Butter made, a copy of which testimonials, with prices, will be forwarded on application to BURGESS and KEY, 103, Newgate-street, Sole Agents to the Proprietor.

HOSE! HOSE!! HOSE!!! Improved Canvas Hose, Lined and Coated with Gutta Percha for Liquid Manure, Fire Engines, Garden and Farm purposes.—This Hose is greatly improved. The rigidity of seam avoided, the flexibility increased, the waterproof qualities extended, the price more reasonable. Much research and trial by the Manufacturers, has enabled them to arrive at what they consider a perfect Hose. Improved Gutta Percha Union Joints of all sizes. Gutta Percha in all its branches.—Apply to Messrs. MITCHELL and Co., 93, High Holborn, London; International Depot for Patented and other Inventions.

**The Agricultural Gazette.**

*SATURDAY, JULY 5*, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

| | | |
|---|---|---|
| WEDNESDAY, July | 9 | Agricultural Society of England |
| THURSDAY, | 10 | Agricultural Imp. Soc. of Ire and. |
| TUESDAY, | 15 | Meeting of the English Agricultural Society at Windsor. |
| WEDNESDAY, | 16 | |
| THURSDAY, | 17 | |

ANY one who has paid the least attention to the progress of agricultural chemistry within a comparatively recent period, must be convinced that the existence of certain mineral elements in the ashes of plants, in very regular proportions, according to the different genera and species, is not the result of accident, but that many of them are essential to vegetable life. Analyses of the ashes of plants, and deductions which have been legitimately drawn from the facts revealed, have shed much light on the relations of geology to agriculture, and have taught us to look beyond mere considerations of texture for the primary elements of fertility. Thus far theorists agree. The practical agriculturist, however, discovers that theoretical doses of mineral matters, such as would be naturally suggested by chemists, do not supply his "deaf" loams with the materials which will remedy the innutritious qualities of his Turnips and Grasses, which he finds so opposite and diverse on soils which, so far as he can judge, are physically similar; and an application of nitrogenous manures, wherein is contained the basis of all nutritive matter, only aggravates the evils that are intended to be remedied. The most important service which chemistry has done to agriculture has been the discovery of the relation which nitrogen holds to the other vegetable constituents of plants and the intimate relation which its compounds have to animal nutrition. It is now clearly made out that under our systems of cropping, nitrogen in such states of combination as can be assimilated by plants is the chief element of which our soils have suffered exhaustion; it being at the same time the most expensive constituent for which the farmer has to go to the market, to buy it—in guano, and in all other manures.

Our views of the influence of nitrogen on vegetable growth were very imperfect, until LIEBIG propounded his theories on the subject. After demonstrating that compounds capable of supplying it to plants existed in the atmosphere in abundance for the wants of all vegetables growing on the surface of the earth, he proceeded to apply the very principles which he observed in one class of plants that actually did obtain and work up as much of nitrogenous matters from these natural sources, as the most highly manured Wheat field was able to accomplish on the same space, to every other crop which it was the object of cultivation to produce, in circumstances which were quite abnormal, but demanded by the tastes and wants of man. Although LIEBIG did much to give us correct notions of the manner in which plants obtained the nitrogen contained in their structure, as well as practical hints of immense importance in the preservation and economising of manuring substances still a large amount of disappointment has arisen from his assuming that "the crops on a field diminish or increase in exact proportion to the diminution or increase of the mineral substances conveyed to it in manure," and from the high expectations which were formed on the promulgation of these statements, great discredit has fallen on the other truths which he taught us.

Since our soils contain nitrogen in very small proportions, and since cereals remove it, as has been found, in large quantities in their products, often expending a much larger quantity in the growth and maturation of their seeds than these actually assimilate, it must be very evident that some plants which are grown in our rotations must have the power of appropriating it from the natural sources—the air and rains—or else our fields would soon be reduced to barrenness. The conditions under which any class of plants yield either less or more nitrogen in their produce than is contained in the soil, thus becoming more or less exhausting, are subjects of great practical importance in rightly apprehending the principles upon which manuring depends. The question at once suggests itself, whether this is a natural defect in their structure, in consequence of which some can grow and flourish only in a soil which has been enriched by artificial means, or through the decay of others that yield up the nitrogen contained in them, while some plants have the qualities of appropriating enough for their wants from the atmosphere alone. Or whether it may arise from the external conditions to which we have subjected these so-called exhausters, being inconsistent with their exercising the function of appropriating the nitrogen from those natural sources which, unassisted, are so ample for the abundant produce of the Oak and other timber trees. We must confess that our opinions are more in harmony with the latter proposition than with the former one. We believe that all plants have the power of collecting their organic constituents from the air, if the requisite conditions are maintained for their so doing, but if not, art must supply what nature cannot do under the circumstances.

It is often observed that, within certain limits, the abundance of one element of growth will compensate for the deficiency of another. A richly-manured field will maintain a verdant hue against very unseasonable weather, when another field, having the same temperature in the soil and atmosphere, will exhibit a sered and withered aspect. Every species of plant is variously affected by heat, light, moisture, &c.; in fact, each is its own thermometer and hygrometer, and the readings of our imperfect instruments are left in the rear. The necessities of man have placed many of them under cultivation in conditions totally different from their native climes, and it is the art of culture to assist Nature in accommodating herself to artificial demands and surrounding circumstances. The elements of animal nutrition are almost the same in all vegetables used as food, but only in various states of elaboration, and the various races of plants can only be looked upon as different machines to collect and store up the crude materials and fit them for animal bodies: and, while the products are in a great measure similar, the elements out of which these are formed are still more so. Chemical theories of vegetable nutrition are very apt to be pushed too far, if they are merely founded on isolated experiment; and solutions of our agricultural experience and practices are exclusively looked for from this source, while they have often more to do with the physiology than the chemistry of plants.

A series of articles lately appeared in the leading section of the *Gardeners' Chronicle*, on the assimilation of nitrogen in plants, and illustrations were given of the complex conditions that vegetables are subjected to, both within and without the soil. We do not, however, intend to go over the ground which has already been trodden, but rather to take up another branch of the subject which has not occupied attention, on which, for agricultural considerations, it

has a prominent claim. In the interesting papers alluded to, we were struck with the following passage:

"It is pretty well ascertained, that the two most valuable ingredients of dung and similar rich manures, are the phosphoric acid and nitrogen which they contain; and it is plain that the quantity of the former, which plants are able to take up, must depend upon the proportion of it naturally existing in the soil, or artificially added to it. In the case of ammonia, however, it must be different if the quantity which plants contain is independent of the soil altogether, and depends on the proportion which they are able to collect from that unlimited source, the atmosphere. It is evident that if plants are able to appropriate the nitrogen of the air, *our views respecting the application of manure must be considerably modified;* because the question will no longer be, how to fix ammonia, and how to supply plants with a certain quantity of nitrogen in a state of combination, but rather how *to bring plants into that state in which they are best able to appropriate the nitrogen of the air.* Always therefore bearing in mind that it is by no means impossible that plants may absorb a portion of free nitrogen, *we must say that probability is much against it.*"

We believe that this extract embraces most important considerations in agricultural practice, and that many of the fanciful distinctions which are often drawn and made in regard to the fictitious value and effects of different specific substances on certain classes of vegetables, are in a greater measure due to the state in which we have placed the plants, than to the fact that the food or requirements of our crops are different. And, besides, some of these principles lie at the root of those questions which involve and determine the agricultural tendencies and systems of a country. For without overrating or trusting too much to primitive practices, still the natural history of many of them affords a safe guide by which to survey and trace the spirit of modern innovation, which has brought into the field skill and capital, and thus introduced new disturbing elements.

The power which our cultivated plants have of developing their organs, and maturing their products, depends on certain states of soil and atmosphere. The economy with which they can work up the nitrogenous materials supplied to their roots depends on a vast number of circumstances, some of which are within, while others are entirely beyond the control of the cultivator. The same ends are sometimes attained by very opposite means—thus, for example, we see Mr. H. Davis and others obtain large results in the cultivation of the cereals, from comparatively small outlay in the shape of manure, by their skilful and careful management, and to us the rationale of their practice seems to be, that by placing the plants in healthy and favourable states to extend their roots and leaves, they either expend less manure in their growth, or can rely to a greater extent upon the natural sources, and thus they are able to supplement the deficiency of vegetable food in the soil, which would have been inadequate for effecting the same results had the ground been overcrowded with plants, and unassisted by acts of cultivation. No one will deny that there is a wide margin for effecting a saving, when we consider that the cereals are supposed to expend five parts of ammonia in fixing one equivalent in their produce. We cannot believe that this is a necessary proportion. But on the other hand, the atmospheric elements—arranged in endless variety—have specific influences on vegetation, and accordingly modify results. Over what wide geographical limits is that wonderful plant, the Wheat, distributed by man! Were its most favourable clime, for production, dependant on a certain amount of temperature, the lines of our thermal maps would then furnish us, as they are supposed to do, with safe and easy guides in our inquiry. But if we dip a little more minutely into practical details, a vast number of compensating elements thrust themselves on our view, which will often render it difficult to say, whether that much desired district is situated on the verge of its Polar or Equatorial limits. Do its natural means of subsistence and capabilities of maturation keep pace with each other? Does the same amount of that essential element, ammonia, produce a corresponding return of produce in all its latitudes? Apart from all party and political considerations, the answer to this question would afford important topics for discussion; but we can only refer to them incidentally in illustration of the leading principles above adverted to, as these apply to our narrower task of endeavouring to lay bare the natural foundations upon which rest the varied systems of agriculture over the British islands. It will be our wish, in dealing with the subject, to do it with impartiality to all parties. In the prosecution of our inquiry, we shall first examine into the current chemistry of the subject, which lies on its threshold, and for this end we intend to review some of the deductions which Mr. Lawes has arrived at, in his excellent papers on "Agricultural Chemistry," in the 8th volume of the Royal Agricultural Society's Journal, so far as they lie in our way. *R.*

## REPORT ON THE AGRICULTURAL SECTION OF THE GREAT EXHIBITION.

[A mistake was committed in our notice of the Chaff-cutters last week. The machine *like* a chaff-box, with a bottom of endless web, and vertical saw-edged knives, as well as a radial curved knife, shown by Smith & Co., of Stamford, is for *cutting fat.* Smith's Chaff-cutter, however, we have noticed as worthy of every commendation—for the completeness of the cut, the variety of the lengths of chaff, and the efficiency of the feeding apparatus—as, so far from a skilful feeder being required in order to keep the engine going without choking, the box may be fed by even a boy with a fork. *I. A. C.*]

The next division is "E—Field, Fold, and Yard Machinery."

Turnip-cutters are shown of the disc, cylinder, and other forms. Stanley's has a vertical disc, carrying two large V-shaped knives, with smaller preceding ones at right angles, in order to subdivide the slices. An inventor named De Porquet exhibits a model of a Turnip-cutter, which has large and small knives fixed upon the exterior of a cone on a horizontal axis. The knives resemble those of the original disc cutter; the hopper seems incapable of clogging, and the slices fall out at the expanded side, and not inconveniently underneath.

Burgess and Key, of Newgate-street, London, exhibit a patent Turnip-cutter, which consists of a long trough partitioned into four, the bottom being an iron plate, which carries the knives, and is vibrated to and fro endways. The cutters in each compartment are of different sizes for cattle and sheep, and gratings allow the slices to drop through; but an alternating sliding motion of this kind can hardly be so good or easy as the rotary one—on much the same principle that makes the *Times* printing-press, with its revolving type-cylinder, a better machine than one in which the horizontal form is rapidly reciprocated.

C. Phillips and Co., of Bristol, show their patent Improved Gardners' Turnip-cutter, in which the hopper, constructed with grated sides, is made to shake, by means of a small crank, a spiral spring upon the connecting rod preventing any jolting or concussion from the movement.

To improve upon the best model, is to approach nearest to perfection; and therefore one of the very best Turnip-cutters yet manufactured is that exhibited by B. Samuelson, successor to the late Mr. Gardner, of Banbury, which remedies the principal defect of the famous instrument invented by that maker. At the Royal Agricultural Society's two last meetings at Norwich and Exeter, Mr. Samuelson obtained the prize for his addition to the Turnip-cutter for sheep, of a knife which cuts large slices for cattle, and is brought into action by merely reversing the motion of the fly-wheel. In all barrel Turnip-cutters hitherto made, the last piece of the root was allowed to pass through unslit, or if cut, it was done with considerable waste and loss of power. The Turnip-cutter recently patented (Jan., 1851) by Mr. Alexander Samuelson, has upon it the words—"cuts the last piece," and this is effected in the following way: the last piece of each Turnip is thrown by the centrifugal action of the barrel upon a ledge about on a level with the axis, where it is held until it is cut by the knives at their next revolution. Another improvement is the substitution of a patent wrought-iron frame for the wooden one hitherto used, which adds greatly to the durability of an implement left in the field for months night and day, and in all vicissitudes of weather.

Among Washers, of which there are several varieties with more or less mechanism about them, there appears to be none more simple and effective than Crosskill's Archimedian Root-washer, and the similar machine, made of perforated zinc, for washing Beans. Stanley exhibits his well-known Steaming Apparatus, which gained the Royal Agricultural Society's prize at Exeter, Norwich, and York. The Portable Steam Generator has a tub for boiling on one side, and a pan or tub on the other for steaming. The boiling tub is surrounded with steam, so that the contents cannot burn; it boils in 30 minutes, and when at boiling point, a jet of steam is sent by a pipe into the middle of the compound, to stir it up. The waste steam from the boiler of the engine which works the cutters and mills before mentioned, as being compactly yet conveniently arranged, may be made to heat this copper. The steaming-pan swings, so as to turn over for emptying; and the steam enters at the top—not, as is commonly the case, at the bottom, when it becomes condensed by the water from the roots, almost as quickly as it comes in.

Mr. J. Blackhall, of Edinburgh, shows a model of a High-pressure Steam-boiler, for digesting bones for manure, heating tanks, retting Flax, steaming chaff, Turnips, and other food for cattle. The inventor informs the public that "the process of steaming bones supersedes the use of expensive crushing machinery and sulphuric acid at present required. The cost of fuel and labour by this new method from 3*s.* 6*d.* to 6*s.* per ton." Now, as many will want to know the real merits of an apparatus for this purpose, and whether steamed or boiled bones are as valuable as bone-dust or superphosphate, we may, perhaps, assist them by giving the conclusion arrived at from trial by Mr. Hannam, in Morton's "Cyclopedia of Agriculture." "That in many districts Mr. Blackhall's idea will be very valuable, is certain. That it can, however, supersede dissolved bones, where they are required, or be cheaper than crushed bones, where *power* is cheap and steam is dear, is more than we can or ought to expect from it." From experiments by Mr. Slight, of Edinburgh, it seems "that the mere process of steaming was *not sufficient* to bring bones into a state fit for application; but that a supplementary one of pounding or bruising was necessary;" and Dr. Anderson came to the same conclusion. The advantage of the new process over that of crushing, in point of expense in the process, is by no means clear. The steaming and after process are estimated at 10*s.* per ton, but may cost much more; and if to this be added 10*s.* for carriage, and 5*s.* for interest and risk of capital, the expense will amount to more than the price paid for crushed bones. "That this method can supersede bones and acid, is not to be expected. Mr. Blackhall overlooks the fact, that if we pay for acid, it prevents our paying for a larger quantity of bones. In all instances, experiments establish this conclusion, even in comparison with fermented bones." The application of steam to *facilitate* the dissolving of the bones by acid is, however, a desirable improvement; and may, perhaps, with this furnace, be found to answer. It appears that, after steaming, the coarser fragments of crushed bones are more thoroughly dissolved than the finely ground, and with a reduced quantity of acid. In this way the extra expense of bruising bones so fine, as well as a third of the acid, has been saved; but whether the cost of steaming overbalanced this saving, we are unable to state.

Among the machines of use in a farm-yard, and valuable as assistants in manuring, we must not forget to mention Deane, Dray, and Deane's patent Cess-pool Cleanser. It is calculated to effect a saving of precious fertilising liquid, and economise the mode of its application to the land. *I. A. C.*

## THE MANAGEMENT OF GRASS LAND IN THE NORTH OF FIFE.

The following paper by Mr. Haxton, of Drumnod, is the abridgment of a paper read by him at a late meeting of the Highland and Agricultural Society of Scotland, when the subject of discussion was, "The most suitable proportions and quantities of Grass and Clover seeds to sow for hay, soiling, and pasturage; the substances most profitable for top-dressing, and the proper time to apply them."

The whole district is exceedingly uneven, being elevated into long ridges, or isolated conical hills, with intervening valleys. The quality of the land is, consequently, very various, passing from a poor, thin soil, near the tops of the hills, to a fine alluvial deposit, at their bases; while, between these extremes, there is much excellent dry, sharp land, capable of producing good crops, both of corn or roots. In this part of Fifeshire, Grass seeds are generally sown amongst Barley, either in a five or six-course shift, but on the firmer and deeper class of soils, they are not unfrequently sown amongst Wheat when this crop is taken instead of Barley. The larger proportions (two-thirds) of the Grass sown in my neighbourhood is for pasturing cattle and sheep, while the remaining one-third is cut for hay, or for soiling horses and cows, and occasionally a few cattle are fed in the yards on the soiling system. The kinds of Grasses and Clovers sown for pasture are perennial Rye-grass (of which there are several varieties), some of which are local, and others, as the Ayrshire, brought from a distance. Common red and white Clover are also sown along with Rye-grass, and latterly Cow-grass has been a good deal sown. When the land is intended to remain two or more years in pasture, and to a less extent, Alsike Clover has been cultivated very successfully for the same purpose. For soiling and hay, either annual or perennial Rye-grass is sown—the latter always, of course, when the land is to remain in Grass a second year—and common red Clover, Cow-grass, or a half and half mixture of the two. The usual quantities sown for pasture are—1½ to 2 bushels of perennial Rye-grass, 5 lbs. of white Clover, and 3 to 4 lbs. of red Clover, or a like quantity of Cow-grass; and for soiling, 4 to 5 pecks of Rye-grass, and from 8 to 10 lbs. of red Clover or Cow-grass per Scotch acre. Now, as regards the quantities of the different kinds of Rye-grass and Clover usually sown per acre in the county of which I am speaking, I am convinced that the error has long been committed of sowing too much Rye-grass and too little Clover. The reason usually assigned for sowing so large a proportion of the former, compared with the latter, is, that Clover—the red variety especially—is so uncertain a crop, that it is necessary to adopt the precaution of having the land well stocked with Rye-grass, in order to obviate, or at least lessen, the loss that would be sustained in the event of the Clover proving a failure. However readily we may be inclined to admit the necessity of such a precaution, it must be evident to most minds that the practice itself is productive in no small degree of the evil sought to be avoided, for as Rye-grass pushes away more rapidly in spring than Clover, so will it, when too thickly sown, be the more ready to impede or choke the growth of the latter. This is particularly the case as regards Rye-grass and red Clover sown together for soiling, or to be made into hay; and even in the case of pasture Grass, we have all, I dare say, experienced the

bad effects of the Rye-grass running to seed, and becoming so hard and withered, that neither cattle nor sheep will eat it, unless forced to do so by sheer necessity. The better plan in both cases, I believe, would be to increase the quantity of Clover sown, and diminish that of Rye-grass. The 8 or 10 lbs. of red Clover usually sown for soiling or hay, should be increased to 14 lbs. at least, and for pasture 8 or 10 lbs. of white Clover, and 5 or 6 lbs. of red Clover or Cow-grass might be used with advantage. The herbage produced from a thick plant of Clover, with only a moderate mixture of Rye-grass, is not only more succulent and nourishing, but also more rapid in its growth—whether used for growing purposes or for soiling—and will keep a larger number of stock per acre than that yielded by a field where the Rye-grass bears a large proportion to the Clover. In the one case, that of Rye-grass, we get an early spring growth, which ceases at Midsummer; while in the other, that of Clover, we obtain a constant succession, until vegetation is checked by autumn or winter frosts. The greatly diminished cost both of red and white Clover removes all objections on the score of expense. The difference of cost in seeding an acre with Rye-grass and red Clover now and formerly, according to the data given above, will be:

| Formerly. | | | | Presently. | | | |
|---|---|---|---|---|---|---|---|
| 2 bush. Rye-grass ... | £0 | 7 | 6 | 1 bush. of Rye-grass | £0 | 3 | 6 |
| 8 lbs. of red Clover, at 10*d.* ... ... | 0 | 6 | 8 | 15 lbs. of red Clover, at 6*d.* ... ... | 0 | 7 | 6 |
| Total ... ... | £0 | 13 | 8 | Total ... ... | £0 | 11 | 0 |

But as this does not give a fair comparison, as regards the two systems, at present prices, we may contrast them in another way:

| Present system. | | | | Proposed system. | | | |
|---|---|---|---|---|---|---|---|
| 2 bush. of Rye-grass, at 3*s.* 6*d.* ... ... | £0 | 7 | 0 | 1 bush. of Rye-grass | £0 | 3 | 6 |
| 8 lbs. of red Clover, at 6*d.* ... ... | 0 | 4 | 0 | 15 lbs. of red Clover, at 6*d.* ... ... | 0 | 7 | 6 |
| Total ... ... | £0 | 11 | 0 | Total ... ... | £0 | 11 | 0 |

Which gives exactly the same expense in both cases. This comparison holds good whether we sow red or white Clover, but of course when Cow-grass or Alsike is sown, the expense will be correspondingly increased. In confirmation of what has been stated, I may mention that, in the spring of 1848, I sowed, by mistake, 20 lbs. of Alsike Clover per acre, instead of 10 lbs., and the result was the thickest and most luxuriant pasturage I ever had on my farm, so much so that I do not exaggerate when I say that the portion of ground so treated kept twice the number of stock than any other part of the field. In this case, however, something must be allowed for the circumstance that the other part of the field was sown with white Clover and Cow-grass, at the rate of 5 lbs. of the former to 4 lbs of the latter, and was also not so good land, but notwithstanding that the data do not bring out a clear verdict in favour of the thick sowing of Clover, inasmuch as the trial was not betwixt Clover of the same variety, yet I am satisfied that the result would have been the same, had the comparison been made between 20 lbs. and 10 lbs. of the same variety of Clover. I have been fortified in this opinion by conversing with and seeing the practice of a farmer well known in East Lothian, who informed me that he had continued to increase the quantity of Clover sown on his farm, until, by repeated experiment, he found that the best results were obtained by sowing from 16 to 20 lbs. per Scotch acre. It is for these reasons that I have come to the conclusion that my own practice has hitherto been faulty, and in future I shall certainly sow at least 14 lbs. of Clover to the acre when for pasture or hay.

The mode of sowing Grass seeds in the district referred to, is to scatter them broadcast, either by the hand or by a machine, the former being by far the most common way, upon a rolled or finely harrowed surface, which the previous harrowing of the Barley generally affords. For example, after sheep *tath*, the land being ploughed in ridges or large feirings, is sown with Barley or spring Wheat, and after a double stroke of the harrows has been given lengthways, and a single stroke across, it is rolled, and the Rye-grass and Clover, previously mixed together, are sown on the smooth surface, and thereafter covered by a double or single stroke of a break of light harrows. Light harrows are not, however, always used for this purpose—the operation often being performed by the ordinary heavy harrows used for covering seed-corn—but this I consider to be a very great mistake, as much of the Clover, as well as Rye-grass, is deposited too deeply for germinating vigorously, and the probability is that a considerable proportion never vegetates at all. A pamphlet published some years ago by Messrs. Drummond and Sons, of Stirling, on the Sowing of Grass Seeds, gives an experiment, illustrated by a diagram, by which it is satisfactorily proved that small seeds, such as red and white Clover, and several of the natural Grasses, do not vegetate at a depth greater than 1 inch and a half below the surface, or if they do, the stem is too feeble ever to produce a healthy plant. If this be true, and few we think will doubt it, if is no exaggeration to say that wherever Grass seeds are covered by the common harrows, one-half of the Clover and a large proportion of the Rye-grass are literally buried, in consequence of being deposited below the germinating point.

In the pamphlet already referred to, even light harrows are considered objectionable, on account of their liability to bury the seeds of Clover; and the chain-web harrow and the bush harrow are recommended as the "only efficient" implements for Grass seeds. As I have never used either of the latter, I am unable to say how far the statements in regard to them are correct, but I may mention that the Grass harrows I use are very light, weighing only 21 lbs. each, and are made with wooden balls and sheaths, iron teeth, each of which is fastened into its socket by means of a screw and nut. Six of these harrows form a break, covering 15 feet, and are drawn by two horses attached to a long swingle-tree. These harrows are coupled together by iron sliders, so constructed as to admit of a considerable vertical and longitudinal motion; thus, in some measure, making each harrow independent of its neighbour. They work remarkably well, striking every height and hollow of the ground equally, and are admirably adapted either for covering Grass seeds or breaking the crust from hide-bound winter Wheat.

While on the subject of harrowing Grass seeds, I may state that what applies as a rule in the case of small seeds is applicable to a certain extent in the case of all the Cerealia. The seeds of Wheat, Oats, and Barley vegetate most freely and vigorously when near the surface, atmospheric air being as essential to vegetation as heat and moisture. But, of course, in practice it is found necessary to deviate from the theoretical rule, in order to obviate the destructive effects of other causes, such as the ravages of birds, and the changes produced on the immediate surface of the soil by the alternate frosts and thaws of winter. I may state here, however, that 1½ inch below the surface is sufficiently deep to enable the young roots of all cereal grains to withstand the atmospheric changes referred to; and, in proof of this statement, I may mention that for two years I used Grass harrows for covering autumn and winter-sown Wheat, whether drilled or sown broadcast, and the result was in every way satisfactory, whether as regards the thickness of braird, its permanence, tillering in spring, or yield at harvest. So far as my experience goes on this head, it is entirely opposed to the practice of ploughing in the seeds of Wheat, Oats, or Barley. With Beans it is quite different, as the vegetative power of one seed is equal to the raising of a weight of 4 lbs.

I have mentioned these facts—although a little apart from the subject of the present discussion—in confirmation of the experiment given in the Messrs. Drummond's pamphlet, and for the purpose of proving that if the seeds of corn-bearing plants suffer injury from being too deeply deposited in the ground, much more will the small seeds of Clover aad Rye-grass, and I may add of Turnips also. In sowing Rye-grass and Clover amongst autumn or winter-sown Wheat we are never exposed to the risk of burying the seeds, and hence we find that when early enough sown, both Clover and Rye-grass take root and vegetate freely, although neither harrowed nor rolled. Many instances are fresh in my recollection of Clover and Rye-grass being sown amongst young Wheat as early as February, without any harrowing or rolling, and although followed by every variety of ungenial weather, the plant and subsequent produce were all that could be desired. This proves two points, first, that Grass seeds vegetate most freely when deposited on or near the surface of the soil; and secondly, they thrive best when the land is firm and well consolidated. While, however, it is true that Rye-grass and Clover sown as early as February will do well without any harrowing or rolling, it is altogether different when we approach farther into the spring months. Then it is absolutely necessary either to harrow or roll after sowing, otherwise the dryness of the air and the heat of the sun will destroy the vitality of seed quite as effectually as if they were deposited 3 or 4 inches below the surface. My practice is to sow amongst Wheat as early in spring as the land will admit of the harrow and roller being used without working raw—the double object thereby being accomplished of breaking up the winter crust, and covering the Grass seeds at the same time. I will now say a few words on the laying down of Grass to permanent pasture. If for grazing purposes solely, the following kinds and quantities, per statute acre, would, I think, form a good mixture for dry land of medium quality:

| | |
|---|---|
| Perennial Rye-grass ... ... ... ... | 1 bushel. |
| Hard Fescue ... ... ... ... ... | 4 lbs. |
| Sheep's Fescue... ... ... ... ... | 4 „ |
| Meadow Foxtail ... ... ... ... | 4 „ |
| White Clover ... ... ... ... ... | 5 „ |
| Alsike ... ... ... ... ... ... | 3 „ |
| Cow-Grass ... ... ... ... ... | 3 „ |

Both Lawson and Drummond recommend Timothy and Cocksfoot for permanent pasture, but while I would not for an instant oppose my limited practice to the very extensive experience of these gentlemen, I must say that I cannot recommend either of the above-named Grasses for dry trap soils. They are both coarse Grasses, and when grown on such soils, in a dry climate, produce a hard and woody herbage not relished by sheep or cattle, especially the former. A residence for some time in Ireland has led me to the conclusion, that both Cocksfoot and Timothy may be sown with advantage in deep land, situated in a moist climate; and the reason simply is, that these plants produce a more succulent herbage under such circumstances, than when both soil and climate are dry, as is the case in most parts of the eastern sea-board of Scotland and England. The Fescues are small-stemmed Grasses, and never get coarse, and I believe they make up in closeness of sole what they want in luxuriance of growth. I was long under the impression that Cocksfoot, from its rapidity of growth, even in dry weather, and on dry land, would prove an excellent Grass for my thin trap soil; but although it grew well, and was much earlier than the common Rye-grass, I found that both cattle and sheep preferred nibbling the latter, however short, to eating the former, however luxuriant. Before leaving this subject, I would lift up my testimony against two Grasses which are generally recommended for permanent pasture, these are Crested Dogstail and Holcus lanatus. The latter is a soft, worthless, innutritious Grass; and the former is hard and wiry, and should never be sown except for bowling-greens or policy-grounds kept constantly under the scythe. It is generally recommended for lawns, but this I consider a great mistake when the Grass is not to be cut, but pastured by sheep or cattle. There is a very handsome lawn in my neighbourhood, very much disfigured by the prevalence of this Grass, which the proprietor, I have no doubt, would give a good round sum to get extirpated. This lawn is regularly pastured by sheep, and during spring and the earlier part of summer it is beautifully green, but towards autumn and during the whole winter it is quite brown with the tall ripened stalks of the Crested Dogstail, which have been left untouched by the sheep.

With respect to those manures best adapted for increasing Grass crops, I have found it a very good, but not an unfailing plan, to apply farm-yard manure to the previous corn crop. Ten to 12 cart-loads laid on this way, generally give better Clover than half a crop of Turnips consumed on the land by sheep. It is seldom, however, according to the present system of green crop husbandry, by which the great bulk of our manure is applied to the raising of roots, that we can command a sufficient quantity of farm-yard dung to apply to those crops amongst which Grass seeds are sown, and consequently recourse must be had to some of the special manures for the purpose of increasing the produce of our Grass fields.

Ten years ago, I first commenced using these manures as top-dressings for Grass, and during the intervening period I have tried guano, saltpetre, nitrate of soda, sulphate of soda, common salt, and sulphate of ammonia, with various success, but latterly I have confined myself entirely to guano, nitrate of soda, and sulphate of ammonia, either separately or mixed together. Last year a mixture was employed with great success, consisting of 1 cwt. of guano, ½ cwt. sulphate of ammonia, and ½ cwt. of nitrate of soda, to the statute acre, the cost being exactly 25*s.* The two latter substances, mixed half and half, have been a good deal used in Fife within the last two or three years as fertilisers for Grass land, and I believe with very great benefit in most cases. There is one circumstance, however, I have noticed in connection with the use of these fertilisers, viz., that if applied to a field in which the Rye-grass predominated over the Clover, the effect produced was a remarkable growth of the former and nearly the entire disappearance of the latter; and on the other hand when the Clover predominated, the Rye-grass disappeared. If this be a general rule it proves the propriety of sowing a large proportion of Clover in those fields we intend for hay or for soiling, as it is only when there is plenty of Clover that we can expect a succession of cuttings throughout the summer and autumn.

The best time to apply guano and ammoniacal salts and the nitrates to Grass is just when spring vegetation has fairly commenced. April I find to be the best month for applying these substances, and a rainy day is always selected for the purpose, as much depends on this circumstance for giving the Grass a quick start. My experience of liquid manure as a fertiliser is so very limited and imperfect, that I do not consider myself qualified to pronounce any opinion as to its utility. All the liquid manure made on my farm is nearly absorbed by the straw-yard, and what escapes is caught upon a large compost heap placed near the outlet of the yards, but at a much lower level, and what escapes from this mixen, which is only a very small quantity, is allowed to run over a field immediately below, so that in this way I do not think there can be any very notable quantity wasted. I have tried guano partly dissolved and partly diffused through a large quantity of water as a top-dressing for Clover aftermath, but the weather being very droughty at the time, the result was not by any means satisfactory, and the experiment was not repeated.

I am strongly inclined to think that dilute solutions of nitrate of soda and sulphate of ammonia might be advantageously applied to Clover; and if spared, I shall certainly give the plan a trial next summer. A cwt. of these salts in equal proportions dissolved in 400 gallons of water would suffice for an acre. Assuming the gallon of water to weigh 10 lbs., this would give a solution containing about 3 per cent. of salts; which, so far as I am aware, would not be too strong for Grass. Of course, in wet weather, it is quite unnecessary to make solutions of nitrate of soda or sulphate of ammonia, as they are both easily dissolved by rain, or even when scattered over a moist surface; it is only, therefore, to dry weather that the suggestion refers. Before concluding these desultory remarks, I would beg leave to say that in obstinate cases of Clover failure, the only remedy is a discontinuance of its cultivation for 10 or 12 years. Happily, we have a substitute in Italian Rye-grass, which possesses all the hardiness of common Rye-grass, with the succulency and rapidity of growth which characterises the broad-leaved Clover. I have also proved repeatedly, that land which refuses to grow red Clover, will grow Cow Grass. Finally, I may mention that I have seen fields which refused to grow red Clover, the one rotation, produce an excellent crop the next—Nature thus pointing out the remedy to consist in a longer rotation of crops, thereby placing the Clover crops farther from each other.

## Home Correspondence.

*Drainage Act.*—Understanding there is a Drainage Act passing through Parliament, I venture to suggest, through the columns of the *Agricultural Gazette*, whether it may be advantageous to extend the operation of the general drainage acts to open commons, or waste lands and stunted pastures, whereon a great number of parties are entitled to rights of herbage, either unlimited or defined. In the north of England there still remain large tracts of such land, the expense of dividing and enclosing which may be too great to afford remunerative returns, but the drainage whereof may be attended with highly beneficial results. *A Constant Reader.*

*Manures: No.* I.—Although the subject of manures has been from time to time noticed in your columns, yet I think it would not be inappropriate to briefly notice, in a classified form, their nature, action, and the circumstances affecting their application. The soil is formed from the disintegration of rocks. Plants grow partly at the expense of the soil, chiefly at the expense of the air. Animals are supported by the vegetable and, through their medium, the mineral kingdom also. Some soils, peculiarly favoured, will contribute for a number of years to vegetable growth and existence, but a time will ensue when the natural fecundity of the soil will give way. To maintain the natural fertility of the soil we must add those substances in the same quantities the plant abstracted from it; to increase fertility we must add more. Therefore, any substance which restores these elements of fertility to the soil, to aid vegetable development, is called a manure. Manures may be divided into two classes—organic and inorganic; organic when derived from the remains of organised beings, as plants and animals; inorganic when produced from the mineral kingdom. Vegetable differs much in its action from animal matter. Green vegetables, when deprived of vitality, rapidly decay; their great succulency promotes it when assisted by air, facilitated no doubt by the azotised matters of the sap, which impart the putrefactive tendency, reducing the fibrous organism to carbonic acid, water, and ammonia; at the same liberating its earthy and saline ingredients. Dry vegetables decay slowly—the sap being dried up is less inclined to putrify; but how soon it commences when moistened or mixed with animal matters, as when straw is employed as litter! Peat is a vegetable manure in which decomposition is checked, not only by antiseptic matters, but chiefly by excessive moisture, and the consequent exclusion of air. Yet when dried, and mixed with animal manures or caustic lime, how speedily it moulders down! The principal supply of vegetables for manure is derived from the leaves and stems of grain crops, Grasses, the collection of weeds, the consumption of green crops, and, in some cases, of the seeds of plants. Seeds of plants are not directly used as manures, being too valuable as an article of food. Seeds contain the richest elements for fertilisation—the phosphates and nitrogenous products; hence the rich manure obtained from cattle on oilcake or Linseed grain. The refuse of some seeds is used for manure, as bran, Rape-cake, malt-dust, &c. Green vegetables are sometimes used as a cheap manure, such being cultivated as are of quick and easy growth. Corn-spurry is grown for this purpose in Germany, Lovage in Holland, Clover in America, Lupine in Tuscany and south of France; the plant possessing deep penetrating roots, a thick stem, and much leaves. Turnips sown on stubble, Turnip tops, Rape, Rye, white Mustard, are those generally employed in our kingdom. Buckwheat and Vetches have been also ploughed lightly into the soil, but such crops are either too expensive or too valuable for spring feeding purposes, to be employed. Ploughing up lea land is the most common method of green manuring in this country. Green manuring confers much benefit upon light thin soils, deficient in organic matter; it cannot increase the inorganic part, except by restoring that washed down, and which, in all likelihood, deep-rooted plants bring up. But may it not bring inert mineral substances into action, by the elements liberated from the matter undergoing decay? As weeds should be pulled before coming into flower, to prevent the formation of seed, reproduction, exhaustion of the soil, and escape of nitrogen from the flower-leaves, so ought the same method to be pursued in ploughing down lightly vegetables into the soil on which they grew, to admit air to expedite decomposition, and nitrogen to be absorbed by the decaying roots. To destroy weeds with vivacious roots, as Couch Grass, they should be mixed in alternate layers with farm-yard manure. Many imagine the pests of the farm cannot be thus extirpated; those who have tried the method can testify to its efficacy. Weeds may be placed in a heap, in a twelvemonth they will be reduced to rich vegetable earth. Sea-weed may be mixed with the weeds, or one-third of salt with two-thirds of lime will hasten their decay, and increase the richness of the compost. Weeds should never be burned, for the organic matter is thus dissipated. Peat is vegetable matter imperfectly decomposed. As a manure its value has been long recognised; as a deodoriser, it is now generally admitted. Dr. Anderson and Professor Davy have made some startling experiments on the deodorising property of dried peat. Peat is extensively employed as a manure in Ireland. The inhabitants, during the summer months, cart home the peat when it is dry in the bank, preferring the second spit of the bog, it being more pulverulent. The peat is formed into a heap in the yard, never becoming so wet again as it was. It is broken as finely as possible, strewed under and behind the cattle, placed in layers through the manure heap, made into a compost, with coral, sand, or salt; sea-weed, mixed with weeds, and then wetted with liquid manure, or sewerage waters, or mixed with guano, and drilled in with green crop seeds. The moist peat and stimulating guano conspire to the rapid growth of the young Turnip plant. For light soils peat is admirably suited; as an absorbent, it cannot be overrated. Peat manure and Potato culture are synonymous terms in Ireland. Some individuals state, peat when applied to land, engenders weeds. I have never known it to be the case, and it is questionable if the seeds of aquatic plants will vegetate in dry arable land. Peat should never be applied to land, except in a prepared state. Although charred peat has been known to every country blacksmith for years, and employed by farmers residing in the vicinity of bogs, with success, yet Mr. Rogers is indebted the thanks of the public, for having so strongly urged upon their attention the necessity of investigating its merits. Unquestionably, peat charcoal is a valuable deodoriser, and when mixed with animal substances, forms an excellent manure. I use it extensively in the cow-sheds, stable, and water-closets; and being convenient to a bog, make it for a mere trifle. Thus I prepare it. Place on their ends round a burning sod of turf, as many sods as will form the base of a cone 4 feet in diameter; pile the sods still endways on top of each other, until the sides of the cone terminate in a point. In one hour's time the heap will become one red mass, when it should be extinguished by throwing two bucketfuls of liquid manure upon it. Break the charred turf with the back of a shovel, and wheel the powder into a dry house. Any sod not completely burned in the centre, containing what is called a bone, should be thrown into the next burning heap. Two small boys will make an immense quantity of charcoal in a day. I drill charcoal in with all small seeds, which stimulates their growth exceedingly, and preserves the seed sound; keeps away insects, in consequence of the liquid manure disquieting them. Having several interesting experiments going on to test the efficacy of charcoal with any bog mould and other manures, I shall place the results before your readers at the proper time. *Libra.*

*Temperance.*—It is in vain to preach temperance to the confirmed drunkard, and at the same time offer him the means of indulging his depraved appetite. The custom, so common in most counties, of paying labourers a certain amount of wages, with an allowance of drink, is both injurious to master and servant. In the former it establishes a taste for beer and cider, which after a time must be supplied at any cost; and being thrown temporarily out of work, a score is run up at the public-house, which impoverishes the man for months, inducing him too often to follow poaching, and many other devices, not quite in accordance with the law, to enable him to live, thus destroying a previous fair character, and bringing him into trouble. Those who first put temptation in the labourer's way are to blame; hard work and a hot day make a man thirsty, yet the more he imbibes the more he will require. There can be no objection to a moderate allowance being served out at dinner and supper; but the mischievous system of drinking large quantities should be put a stop to, and an increase of wages substituted. In many cases the plan is adopted as more economical than paying an additional trifle in money on Saturday night; however, it may be classed under the head of "penny wise and pound foolish." There can be no question of the relative value of a sober and a drunken man; no matter what station of life he fills amongst agriculturists, one will perform a greater amount of labour than the other, sticking steadily to the spade or fork, whilst the toper is but a poor creature till he swallows a certain measure of beer or cider, which must be repeated at intervals, or his artificial strength fails. A few iron constitutions can, for a time, bear up against the fearful wear and tear of the system, but the most vigorous at last gives way under the stupefying influence of prolonged indulgence. It is in the power of employers, if they will take the trouble, to mitigate the sufferings of thousands, by refusing to admit the drunkard into their service, and giving encouragement to the man who conducts himself in a creditable manner. The broad line drawn between master and man is much to be regretted, as having the effect of destroying the kindly feeling which it is so advisable to keep up amongst persons who cannot get on in the world without each other. The upper and middle classes are placed in a responsible position with regard to those whom they employ; they should act towards their servants in whatever capacity, either indoors or outdoors, with kindness and consideration, not merely in the light of hired menials, but as part of the family establishment, requiring advice and instruction, and, above all, a good example. The estimate of the value of man's power to produce a certain profit, without reference to his present and future comfort, is a low view to take of a human being, who happens to have been born in a station of life compelling him to toil for his daily bread. It is of the utmost importance to the welfare of this country, that a better understanding should exist, in agricultural districts, between the farmers, gardeners, and their labourers; a desire to assist each other in cases of necessity, should predominate over every selfish consideration. Personal investigation into the manners, wants, and characters of servants, by their masters, would be productive of the most beneficial results to both parties, advancing the interests of society, and establishing a friendly intercourse between master and man, now so rarely witnessed. This should be done in a fair open manner, and not through the interference of a third party, who might be set down as a spy. Although, from long neglect, the working classes are becoming daily more estranged from those above them, yet it is not too late to do much towards bringing them back to a proper sense of their position, and rendering them more contented and happy. But as there is increased difficulty in bending a tree of certain growth, compared with a young sapling, so the task of forming the ideas of an adult is more laborious than instructing and educating youth in the right road to respectability and independence. However, something may be accomplished by perseverance, and the sooner the attempt is made the better for the country; for, with all our ingenuity and all our riches, there is something "rotten in the state of Denmark." Intoxication is not one of the least evils that afflicts the nation; go where an Englishman will, his character as a lover of strong drink precedes him. It is to be hoped that all masters, whether agriculturists, manufacturers, or independent members of the community, will endeavour to check the debasing vice of drunkenness, and thus prevent a wilful waste of health and money. The hard cash squandered away in the pot-houses, both by mechanics and labourers, would be more than enough to keep many a family from the union, if properly invested. Is it just that those who are careful, and work honestly, should be compelled to maintain the idle and reckless? Such is, however, the fact. *Falcon.*

*Protection.*—The farmer needs protection from waste of any kind, whether it be by water, by sun, by wind, by weeds, or by any want of attention or judgment. In many cases ignorance causes wasteful mismanagement; hence it may truly be said, that "knowledge is power." We have need to learn the most economical means of preventing waste in that valuable article, manure, which is almost universally wasted to a lamentable extent. We want to know how we can most cheaply and effectually aid—not supersede—the power of labour by means of machinery. In this department great progress has recently been made, and each advance is a step towards a higher one. But I must now try to turn these preliminary remarks to some definite practical purpose, by confining my observations at present to mechanical means. Let the mechanic try to produce a machine of as simple and unexpensive construction as possible, by which a Turnip or other crop may be obtained on the driest soil and in the driest season. To the thinking, practical farmer, it is evident that manure should be both concentrated and diffused, so as first to stimulate the vigour of the young plant, and afterwards supply continual food to its far-penetrating roots in a more advanced state. Hence the soil should be deeply and finely cultivated, and a small quantity of farm-yard manure carried on and covered up at a dry time. A dry seed bed is also very desirable, if moisture enough can be had just after the seed is deposited. Therefore we want a machine to drill or dibble a little dry manure in a trench or hole, cover it with a very light covering of earth, deposit the seed upon that earth, cover it up and water it. Then as soon as the young plant appears, the machine, divested of its sowing apparatus, should give the plants a slight evening shower of water, the water being enriched and medicated by infusing into each load a little chemical composition, which should accompany the machine. Or the sowing and watering machines might be entirely separate, only that the same wheels and shafts would do for both. But where is the water to be obtained? and will the expense be repaid? These are important questions, to which I answer, "Wilful waste makes woeful want." And what so valuable is so much wasted as water? Instead of suffering the springs that rise out of the hills, and the rains that fall upon them, to run direct into the valley, let all the water be carefully conducted on as high a level as possible, so as to be carried without waste into each field. In addition to this, let the mechanic contrive an economical method of raising water in large quantity to a considerable elevation. Such means as these may form a new era in agriculture, and in conjunction with deep draining of wet and even moderately dry land, and high and deep cultivation of all, enable the farmer to grow as much produce on 50 or 100 acres as is now commonly produced on three or four times as many. The farms might, by such means, be multiplied by subdivision, so as to suit the demand and ability of tenants; for it is an injury to the landlords, the tenants, the labourers, and the whole community, to suffer any man to occupy more land than he can cultivate in the most perfect manner. The study of mechanics will also suggest many other beneficial ideas. *O. F.*

*Charcoal.*—Your correspondent, John Stoveld, reminds me of the old adage, "a wise man does not know everything, and a fool knows something." Now I know this "something," that having made some hundreds, if not thousands, of tons of cylinder charcoal, I am prepared to say that I have obtained a higher price, and a preference over that made in the wood. "J. D.'s" observations about Oak coppices are perfectly correct; his hints about pruning are very judicious, and, if applied to his chemistry, would be equally so—it being too luxuriant as it stands. *W. E. Gill, Truro.*

*Heracleum sphondylium, or Cow Parsnip.*—To all persons who have thought proper, through our recommendation, to cultivate this useful British plant for cattle, and more especially for pigs and rabbits, it is but right in us to observe that now, the beginning of June, is due time to finish cutting the first crop; seed-stalks on two years old plants sometimes appear, such should all be cut and stowed away with the leaves; our own, growing from cultivated seed, is producing an abundance of food, far beyond our sanguine expectations. It is also worthy of remark that the Heracleum giganteum,

from Siberia, is not the plant above alluded to, and is of no use as cattle food, as some have supposed. It is, however, a grand ornamental plant, and worthy a place in all open sceneries. We have plants now about half-grown, free to public inspection, presenting a noble appearance, 7 feet high, with leaves 6 feet long and 5 feet broad, sending up immense shafts 27 inches in circumference. A pair, planted 2 yards apart, cover a space of 15 square yards. The Hon. Lady Matilda Moore, of West Ilsley, who first presented us with this magnificent plant, informs us that she has grown it 15 feet high, with flowers 3 feet in diameter. *Hardy and Son, Maldon, Essex.*

*The Acre.*—A correspondent in the neighbourhood of Worcestershire informs us that there, and in Staffordshire, and Shropshire, the perch is 48 yards, or 7680 yards to an acre. If worthy of notice, we now give an explanation of English statute land measure by Gunter's chain of 100 links. RULE.—To give the contents of a square plot, multiply the length by the breadth, and divide the product by 100,000, the number of square links in an acre. For an angular plot multiply the whole base by half the perpendicular, &c.

*Award of Prizes in the Agricultural Department of the Industrial Exhibition.*—When is it expected that the prize report of the agricultural implements will be made public?—for when I go to the Exhibition I wish to have my attention specially drawn to the most deserving implements, or rather to those that will answer my purpose best, amongst the rest to a gorse bruising hand implement, which do you consider the best for a *Cottage Farmer, Hants.* [The Box bruiser made by Wedlake has had a high character given to it. We don't know when the award of prizes will be made known.]

## Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A WEEKLY COUNCIL was held on the 25th of June: present, Mr. RAYMOND BARKER, V.P., in the chair, Lord Camoys, Sir Montague Cholmeley, Bart., M.P., Mr. T. B. Browne, Mr. Buller, Dr. Calvert, Col. Challoner, Mr. Druce, Mr. T. R. Evans, Mr. Foley, M.P., Mr. Garratt, Mr. B. Gibbs, Mr. Glegg, Mr. Kinder, Col. Kinloch, Col. Le Couteur, Mr. Milward, Mr. Pendarves, M.P., Professor Sewell, Mr. Shaw (London), Professor Way, Mr. Wilbraham, Mr. H. Wilbraham, and Mr. Wilson (Stowlangtoft). The Chevalier de Masslow, Councillor of State, and Secretary of the Imperial Agricultural Society of Moscow; M. Annencoff, Secretary of the Central Society for the propagation of Merino sheep in Russia; and Mr. Bateham, of Columbus, Ohio, were also present at this meeting.

[The attention of the members was called on this occasion to a most interesting collection of presents for the Society, brought over from Moscow by the Chev. de Masslow; and to the result of extensive inquiries which the Council at a former meeting had directed the Secretary to make, in reference to the supply of native phosphate of lime from the United States, and its probable occurrence in our own country: to both of which subjects we shall revert in detail in our next publication.]

A MONTHLY COUNCIL was held on Wednesday last, the 2d of July: present, the Hon. R. H. CLIVE, M.P., Trustee, in the chair, Sir M. W. Ridley, Bart, Sir J. B. V. Johnstone, Bart. M.P., Sir M. J. Cholmeley, Bart. M.P., Sir R. Price, Bart. M.P., Mr. Raymond Barker, Mr. S. Bennett, Mr. H. Blanshard, Mr. Bramston, M.P., Col. Challoner, Mr. Druce, Mr. Foley, M.P., Mr. Garrett, Mr. Brandreth Gibbs, Mr. Fisher Hobbs, Mr. Law Hodges, M.P., Mr. Kinder, Mr. Lawes, Mr. Milward, Mr. Pendarves, M.P., Prof. Sewell, Mr. Shaw, (London), Mr. Stansfield, M.P., Mr. C. H. Turner, Prof. Way, Mr. Jonas Webb, Mr. Wilson (Stowlangtoft), and Mr. Wingate.

Henry Richard Eyre, Esq., of Shaw House, Newbury, Berkshire, was elected a Governor of the Society. The following new members were elected:

Topham, Abraham, High Mowthorpe, Malton, Yorkshire.
Greenham, Frederick, Hendford House, Yeovil, Som.
Wright, T. B., Union-street, Birmingham.
Torcliffe, Thomas, Borough House, Ilfracombe, Devon.
Sawyer, Charles, Heywood Lodge, Maidenhead, Berks.
Besly, William, Dunmoor House, Bradninch, Collumpton.
Atkinson, William, Ashton Heyes, Chester.
Waters, John, Eastbourne, Sussex.
Child, Coles, The Palace, Bromley, Kent.
Busby, Henry Goodear, Moreton-in-Marsh, Gloucester.
Dent, John Dent, Ribstone-park, Wetherby, Yorkshire.
Johnson, Arthur Harry, Heathfield, Hailsham, Sussex.
Nugent, Walter, Thurloe-square, Brompton.
St. Aubyn, H. T. Molesworth, Clowance, Cornwall.
Rickard, Thomas Martyn, Devonport.
Elorza, Colonel da Francisco Maria de, Oviedo and Guipuzcoa.
Feetham, John, Great Burdon, Darlington.
Faviell, Jeremiah Bourn, Stockeld Park, Wetherby.
Melville, Alexander Leslie, The Bank, Windsor.
Darvill, Henry, Windsor.
Byers, James Broft, Strawberry Hill, Pembroke.
Maxwell, Sir John Heron, Bt., Sprinkell, Ecclesfechan, N.B.
Caird, James, Baldoon, Wigtonshire.
Williams, John, Fallowfield Lodge, Manchester.
Saxby, Thomas, Ringmer, Lewes.

FINANCES.—Mr. RAYMOND BARKER, Chairman of the Finance Committee, presented the monthly Report on the accounts of the Society, from which it appeared that the current cash balance in the hands of the bankers was 2584*l.*

WINDSOR MEETING.—Lord PORTMAN transmitted to the Council the Report of the Windsor Committee of the near and satisfactory completion of all the arrangements connected with the ensuing Country Meeting of the Society, to be held in the Home Park in the week commencing Monday, 14th inst.

LEWES MEETING.—The Council, on the motion of Colonel CHALLONER, entered into the preliminary consideration of the prizes to be offered for agricultural implements and machinery at the Lewes Meeting in 1852.

CHANNEL ISLANDS' CATTLE.—At the request of Colonel LE COUTEUR the Council directed the scale of points adopted in the Channel Islands for determining the excellence of their breed of cattle, to be transmitted to the Judges appointed by the Society in that class for the Windsor Meeting, the Council leaving it at the discretion of the Judges to make such use of that scale as they might think most advisable.

LECTURE.—Prof. WAY's next Lecture will be delivered before the members on Wednesday next, at 12 o'clock: "On the Agricultural Employment of Lime."

## Farmers' Clubs.

NEWCASTLE: *February Meeting.*—JAMES KIRSOPP, Esq., J.P., of the Spital, near Hexham, read a paper, entitled "A Review of Some of the Difficulties which Landlords and Tenants have to encounter in the proper Cultivation of the Soil."

One of the giant evils which the landowners of the present day have to contend with, and which appears to receive little attention, is the state of the law relative to real property, or more particularly that portion of it which relates to the law of entail. In a long series of years the English aristocracy have delighted in extravagance and expense of all kinds, and after a life spent in that way, have strictly entailed their estates, so that in consequence of the present proprietors having to support the family mansion, and to pay the interest of debt out of their present diminished rents, they have not in reality the money to carry out those improvements which are so requisite for the prosperity of agriculture. It is a well-established rule in agricultural matters, that no tenant can do justice to his land unless his landlord will give him a lease for 19 years, or thereabouts; that he cannot, as a prudent man, lead materials for buildings and put his land into a good state without having a certainty of tenure; how, then, allow me to ask you, can a landlord who holds an entailed estate, and who, owing to bad health or advanced years, expects the lease of his life to expire every day—how can such a man be reasonably asked to incur the larger expense of building and draining, when, in reality, his *own* lease of the estate is much shorter (because so much more uncertain) than the tenant's? I am perfectly well aware that a partial but insufficient remedy is provided for such cases by the Drainage Act, which enables landlords to borrow money of Government, paying 6*l.* 10*s.* per cent. for the same for 22 years, after which all payments cease; and we constantly hear this act extolled as a boon to the agricultural interest, and we hear intelligent people say, "Oh, borrow money of Government, and your tenant will pay you 5*l.* per cent., so that you will only have to pay 30*s.* per cent., and so get your land drained so cheap!" But stay and reflect a moment, and look at both sides of the picture, before you indulge in so much praise of the act. In the first place, if a landlord is required to pay 6*l.* 10*s.* per cent. for borrowed money, an insupportable burden is added to his present debts, which is quite sufficient to ruin him; for what consolation is it to a man who now requires money, and is in difficulties, to reflect that 22 years *hence*, these payments will cease, and his land be improved? If no better remedy than this can be found, he is to be pitied indeed. But even suppose a tenant agrees to pay 5*s.* an acre more for his land when drained, he will very soon require a reduction of 5*s.* an acre, in consequence of low prices; so that the landlord is just in the same state as he was, with the pleasing reflection that he has an annuity of 6*l.* 10*s.* per cent. to pay to Government. Suppose, for instance, a tenant pays 300*l.* per annum for rent, and the landlord agrees to spend 1000*l.* in draining, for which the tenant agrees to pay 50*l.* a year. The rent of that farm, in truth and in fact, is 350*l.*; and no landlord can impose upon an intelligent tenant by calling the 50*l.* interest money; for if the tenant has to pay the amount, the name of it is of little consequence. Another difficulty which landlords meet with is, that they are not, generally speaking, practical farmers; the consequence is, that they cannot see the wants of their tenants and provide for them. When a landlord possesses practical knowledge, the tenants and land are always better taken care of, because the real wants of a tenant are seen in a moment, and remedied if possible, and the slovenly and dishonest tenant is checked by knowing that his tricks will soon be exposed.—Now that I have called attention to a few of the difficulties of a landlord, let us review shortly the difficulties of tenants. In the first place, the great competition which existed at one time for farms, and the system of letting by proposal or auction, induced many farmers to bid more than they valued the land at, in the hope that, when once in possession, they could effect a reduction. The consequence produced was, that disappointment, bad farming, and arrears of rent soon made their appearance. Insufficient capital is also a difficulty which tenants have to regret. Professor Low, of the University of Edinburgh, says "that a tenant should have 6*l.* an acre capital, if he wishes to do well;" and other writers think he should be able to command even more; but, if we look around, how many do we each know who cannot boast of any such sum! The consequence is, that they are compelled to sell their produce at a loss, when by keeping it a larger price might be realised.—Nothing adds so much to a farmer's prosperity, as his having at all times at his door an abundant supply of skilful and cheap labour; but the farmers are in a great measure deprived of this advantage by the old and cruel law of settlement, as it exists at present in this country. The gentlemen whom I now address are too well aware of the nature and working of this law, of the hardships it inflicts on the real poor, to make it requisite for me to enter into details, further than by saying that this law ought to be entitled "An Act for driving the Poor out of the rural districts, and compelling them to go and reside amid the haunts of vice and immorality in large towns."—I shall now proceed to consider a few of the remedies which are required to bring the landed interest to a healthy state. It is always a much more easy task to point out a difficulty than to suggest a safe and prudent remedy; but the only way to arrive thereat is to discuss frequently such matters, and bring them before the public view. Nothing could confer on the landed interest so much advantage as power being given to the owners of encumbered estates to sell a portion thereof for the purpose of paying off debts. Such a relief would confer present advantage on the landowners themselves, as well as on the labouring poor, by giving them a greater abundance of work; for nothing is so injurious to the country at large as a pauper aristocracy; nor would any injustice in reality be inflicted on the heirs to the property; for a small property, free from debt, would be as valuable as a larger one incumbered with debt. Landlords who have the power to break the entail of their estates should always exercise that power, so far at least as to free it from debt. They should also look more closely to their present expensive establishments, and introduce stringent reforms therein; they should, moreover, look more closely into their own affairs, and become more men of business, and not leave their affairs so entirely to agents and others; for it is only by energetic means of this kind that the owners of the soil can continue such; for if pleasure and amusement be allowed to engross too much of their time, ruin and distress must soon overtake them, and their places be filled by those who, by attention to commerce, have raised themselves to wealth and influence. Mortgage debt, as I have already pointed out, is the monster evil which landlords have to encounter: it is this which keeps their heads under water, and prevents them from exercising that beneficial influence which otherwise would be of such essential service to the lower classes. But how, you will ask me, has it happened that so many of the larger estates are mortgaged and burdened with debt? For a number of years the system which is now found to be so injurious has been as follows:—When the owner of, or heir to, an estate, is about to marry, he, generally speaking, receives the lady's fortune, which is expended in liquidating debts which youth, folly, and bad company had entailed upon him; and at the time he charges his estate with a jointure for his intended wife and portions for her younger children. It is very easy to see the injurious effects in which this killing process must at last involve the estate. This plan is what lawyers very modestly term resettling an estate; they would be much more correct if they would call it unsettling the estate, for sooner or later it will no doubt have that effect.

## Review.

*Delineations of the Ox-tribe; or the Natural History of Bulls, Bisons, and Buffaloes. Exhibiting all the known species, and the more remarkable varieties of the genus Bos.* By George Vasey. Illustrated by 72 Engravings on Wood by the Author. G. Biggs, 421, Strand.

THIS work will interest the naturalist more than the farmer. It relates to the science—the zoology of the subject, rather than to its economics. But the former ought not to be disregarded, even by those to whom the latter is of the most concern. It would be but a poor compliment to the agriculturists of England to suppose them capable of interest in only the money-making aspect of their profession: and the detail of what is known regarding a genus of animals, to which they owe so much, will surely still preserve their attention, even when it departs from the particulars to which the mere breeder and feeder of stock devotes himself.

Mr. Vasey's work is fully illustrated by wood engravings; some of the cuts we cannot speak very well of; those, for instance, of the short-horn, Hereford, and Highland breeds are obviously incorrect; and of many of the others we are unable to give an opinion. The descriptive part of the work seems written with the fulness and confidence of an actual observer, and is probably trustworthy. Mr. Vasey has, however, unfortunately had the bad taste, as we consider it, to travel out of his way in order to criticise with sarcastic severity the descriptions of naturalists of acknowledged eminence; and his own performance will therefore doubtless have to stand a closer and less kindly criticism than it would otherwise have received. His work would have been equally satisfactory, and his authorship would have left a more agreeable impression on the minds of his readers, if the appendices on "the indefinite definition of Col. Hamilton Smith," and "Mr. Swainsons' transcendental attempt at classification" had been omitted.

METEOROLOGICAL REPORT.—JUNE.
(*Continued from pages* 413, 414.)

| Date. | Time. | Max. | Min. | WIND.—WEATHER. |
|---|---|---|---|---|
| June 24 | 11.40 a.m. | 30.18 | ... | 11.40 A.M., breeze sprung up at SSW., and barometer receded. 1.30 P.M., wind SW., increasing. |

* This storm came from the westward, and travelled eastward, over France; after it had passed the meridian of England the temperature fell.

Dorchester, July 3d. *F. P. B. M.*

(*To be continued.*)

## Miscellaneous.

*Patent dated December 7th*, 1850.—Alexander Main, of Glasgow, accountant, for certain improvements in treating the fleeces of sheep, when on the animals (a

communication from the late James Smith, of Deanston, Perth). "The invention consists in dipping the sheep into a succession of chemical solutions, so as to obtain an insoluble, or sparingly soluble, and water-repellant coating to the fibres of wool; thus increasing the warmth and promoting the health of the animal, and at the same time, rendering the wool better suited for manufacturing purposes. The bath in which the sheep are first dipped is composed by dissolving 20 lbs. of alum in 4 gallons of boiling water, and diluting to 40 gallons. The second bath consists of 31 lbs. of soft or black soap, dissolved in a like quantity of water; and these baths will be sufficient for 100 sheep. The dipping, for which three persons will be required, two to hold the sheep, and the third to keep its head out of the solution, is recommended to be performed in a vessel of about 4 feet long, 2½ feet deep, and 2 feet wide, and capable of holding about 20 gallons; the sheep being allowed to dry between each successive dip. Arsenic or sulphur, to prevent the attacks of flies, &c., may be added to the above solutions if thought necessary. Claim. The application of chemical solutions, suitably prepared to obtain, when used in succession, an insoluble or sparingly soluble and water-repellant coating to the fibres of wool, when on the animal." *Mechanics' Magazine, June* 14.

## Notices to Correspondents.

BONE-DUST: *A Young Farmer.* It is useful on lands light enough to permit the weather to rot it, and on lands poor enough in phosphoric acid to benefit by the addition of that substance. Many lands are too stiff, few lands are too rich to benefit by bone-dust. Superphosphate is generally good for Grass lands. Spread it mixed with ashes in quantity enough to enable you to spread 3 cwt. per acre evenly. Iodine as a stimulator to germination is a proper subject for a *parlour* experiment. Unfortunately we have no information on the subject. Chlorine has been found to have that effect.

DEAD CHICKENS: *Anon.* The cause of chickens being found dead in the shells, fully formed, is attributable either to misconduct on the part of the incubator, or to defective vitality in the eggs, which may be ascribed to the fault of the cock, or of the hen, or to staleness in the eggs themselves.

GAS LIME: *A Young Farmer.* It is useful after long exposure to the air, which converts some of it into gypsum. Make it into a compost with any light vegetable refuse, turn it frequently, and use a ton per acre.

ITALIAN RYE-GRASS: *A Sub.* It will not last satisfactorily beyond the first year.

POTATOES: *W C.* The only advantage of earthing them up is that they are more easily dug in October.

SOAP ASHES: *A K Smith* You may expose them for a month or two and turn them in the heap repeatedly, and then spread them broadcast over plough or pasture land, at the rate of 20 or 30 cwt. per acre. If you use them on pasture, they had better be mixed with earth in a compost first.

SUPERPHOSPBATE: *G M.* It may be mixed with *old* ashes without injury.

TO PROTECT EARLY POTATOES: *X A* asks, "Would it probably answer to sow Rye early in July, at 2 feet distance between the rows, to be interlined in February with early Potatoes? The object being to protect the Potatoes from the spring frosts—the Rye to be cut green, beginning with alternate rows, as soon as danger from frost is at an end, say in the first half of May. Would any other grain answer the purpose better than Rye?" [Rye would be the best grain for this purpose. This idea is worth trial.]

EBBATUM: *W S.* For "Imitation wood," in this section of the Paper last week, read "Imitation woad."

# Markets.

## COVENT GARDEN, JULY 5.

Trade remains steady, and the market is well supplied with all kinds of Fruit and Vegetables in season. Peaches and Nectarines continue to be sent in large quantities. English Pines and Hothouse Grapes are plentiful and good. Strawberries from the open ground are now in good demand, and the supply is abundant. Cherries are furnished in large quantities, more especially from Kent. West Indian Pines fetch from 2s. to 5s. each. Oranges and Lemons are plentiful. Nuts remain nearly the same as quoted last week. Asparagus, young Carrots, French Beans, and Green Peas are received in quantity. New Potatoes may be obtained at 1d. to 4d. per lb. Lettuces and other salading are sufficient for the demand. Mushrooms are dearer. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis floribunda, Pinks, Moss and Provins Roses.

### FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 5s to 8s | Almonds, per peck, 6s |
| Grapes, hothouse, p. lb., 3s to 7s | — sweet, per lb., 2s to 3s |
| Peaches, per doz., 10s to 20s | Lemons, per doz., 1s to 2s |
| Nectarines, per doz., 10s to 20s | Oranges, per doz., 9d to 2s |
| Cherries, per lb., 6d to 2s | — per 100, 6s to 14s |
| Melons, each, 4s to 8s | — Seville, p. 100, 7s to 14s |
| Strawberries, p. pottle, 6d to 1s | — — p. doz., 1s to 2s 6d |
| Gooseberries, per half sieve, 5s to 7s | Nuts, Barcelona, p. bsh, 20s to 22s |
| Currants, per hf. sieve, 5s to 7s | — Brazil, p. bsh., 12s to 14s |
| | Cobs, per 100 lbs., 50s to 55s |

### VEGETABLES.

| | |
|---|---|
| Cabbages, per doz., 6d to 1s | Shallots, per bunch, 3d to 4d |
| Cauliflowers, p. doz., 1s 6d to 3s | Garlic, per lb., 4d to 8d |
| French Beans, p. 100, 1s to 2s | Artichokes, per doz., 1s to 2s |
| Beans, per sieve, 2s to 2s 6d | Lettuce, Cab., p. score, 4d to 9d |
| Peas, per sieve, 2s to 4s | — Cos, per score, 3d to 1s |
| Asparagus, per 100, 1s to 4s | Small Salads, p. punn., 2d to 3d |
| Rhubarb, p. bundl., 2d to 6d | Horse Radish, p. bundl., 1s 6d to 6s |
| Potatoes, per ton, 90s to 200 | Red Beet, per doz., 1s to 4s |
| — per cwt., 4s to 8s | Mushrooms, p. pot., 1s to 2s |
| — per bush., 1s 6d to 3s | Sorrel, per hf. sieve, 6d to 9d |
| Turnips, p. bunch, 3d to 6d | Fennel, per bunch, 2d to 3d |
| Cucumbers, each, 3d to 1s | Savory, per bunch, 2d to 3d |
| Radishes, per doz., 6d to 9d | Thyme, per bunch, 2d to 3d |
| — Turnip, p. doz., 8d to 1s | Parsley, per doz. bun., 2s to 3s |
| Celery, p. bundle, 6d to 2s | — Roots, p. bundl. 9d to 1s |
| Carrots, per bunch, 4d to 6d | Mint, green, per bunch, 4d to 6d |
| Spinach, per sieve, 1s 6d to 2s | Basil, green, p. bunch, 6d to 9d |
| Vegetable Marrows, per doz., 1s to 2s | Marjoram, green, do., 6d to 9d |
| | Watercress, p. 12 bunch., 6d to 9d |
| Onions, p. bunch, 2d to 6d | Corn Salad, p. hf. sieve, 1s to 1s 6d |
| Leeks, per bunch, 3d to 4d | |

### HAY.—Per Load of 36 Trusses.

SMITHFIELD, July 3.

| | | | | | |
|---|---|---|---|---|---|

| Old Clover ... ... | 88 | 95 | | JOSHUA BAKER. | |

### HOPS.—FRIDAY, July 4.

Messrs. Pattenden and Smith report that the market continues firm. The late rains have washed away some of the honey dew, but the vermin continues very strong in most parts, with the exception of Worcester.

COAL MARKET.—FRIDAY, July 4.

Hollywell, 13s.; Eden Main, 13s. 3d.; Howard's West Hartley, 12s. 6d.; Wallsend Haswell, 14s. 6d. to 14s. 9d.; Wallsend Gosforth, 13s.: Wallsend Stewarts, 14s. 6d.; Wallsend Tees, 14s. 6d.—Ships at market, 177.

SMITHFIELD, MONDAY June 30.

We had a short supply of Beasts, but the weather being warm buyers were scarce; consequently, on the average, it was difficult to advance prices; however, for something choice and not too heavy, 3s. 6d. was obtained. The number of Sheep and Lambs, although not so large was fully sufficient for the demand. In a few instances rather higher prices were realised, but it was difficult to effect a clearance. Calves were rather more in demand, at a small advance. Lamb was more readily disposed of, but not much alteration in price. From Holland and Germany there are 296 Beasts, 3690 Sheep, 189 Calves; from Spain, 120 Sheep; from France, 30 Beasts; from Scotland, 200 Beasts; from Norfolk and Suffolk, 1800; and 250 from the northern and midland counties.

| Per st. of 8 lbs.— | s | d | s | d | Per st. of 8 lbs.— | s | d | s | d |

| | | | | | Calves ... ... | 2 | 8 | — 3 | 8 |
| | | | | | Pigs ... ... | 2 | 4 | — 3 | 4 |

Beasts, 3156; Sheep and Lambs, 30,690; Calves, 380; Pigs, 410

FRIDAY, July 4.

We are but moderately supplied with Beasts; the weather being cooler they are readily disposed of at a small advance. We cannot quote 3s. 8d., still it is nearly reached, and also 3s. 6d. for Short-horns. The number of Sheep and Lambs is considerable; the demand has, however, increased, and prices on the average are rather better. Calves, although plentiful, are rather dearer. From Germany and Holland we have 105 Beasts, 1052 Sheep, and 252 Calves; from Scotland, 80 Beasts; and 75 milch cows from the home counties.

| Best Scots, Herefords, &c. | 3 | 4 | to 3 | 6 | Best Long-wools | 3 | 6 | — 3 | 8 |
|---|---|---|---|---|---|---|---|---|---|
| Best Short-horns | 3 | 2 | — 3 | 4 | Ditto Shorn ... ... | | | | |
| 2d quality Beasts | 2 | 6 | — 3 | 0 | Ewes & 2d quality | 3 | 0 | — 3 | 4 |

Beasts, 906; Sheep and Lambs, 14,880; Calves, 693; Pigs, 395.

MARK LANE.

MONDAY, JUNE 30.—The supply of Wheat from Essex this morning was small, but fair from Kent; the greater part of the former remains unsold, although offered at a decline of 2s. per qr.: the latter was chiefly disposed of at a reduction of 1s. to 2s. per qr. upon the prices of this day week. There was a moderate country demand for the ordinary descriptions of foreign, but holders not being inclined to comply with a greater reduction than 1s. to 2s. from the highest terms lately realised, only a trifling business resulted. There is no alteration in the value of Spring corn; all descriptions are in good request at fully Monday's quotations. Flour is the turn lower.

FRIDAY, JULY 4.—The arrivals of Wheat since Monday have been moderate, of Oats good. The greater part of the English Wheat left over from Monday remains unsold, a small proportion only having been sold at a decline of fully 1s. per qr. Business in foreign is extremely limited, and vessels with difficulty cleared at a similar reduction.—Barley, Beans, and Peas are unaltered in value.—Oats are a slow sale at a decline of 6d. to 1s. per qr.—Flour continues very unsaleable.—In floating cargoes of grain from the Mediterranean there is little doing, with the exception of Maize, which is more inquired after.

LIVERPOOL, TUESDAY, JULY 1.—The arrivals from Ireland and coastwise during the past week have been quite insignificant, those of foreign moderate. At this day's market there was a thin attendance of the town and country trade, who for the most part, went away without making a purchase. Wheat may be quoted fully 4d. per 70 lbs., and Flour 1s. per sack, and 2s to 2s. 6d. per barrel lower, at which decline, towards the close of the market, several parcels of the latter article changed hands on speculation. Oats and Oatmeal were scarcely inquired for, and decline ½d per 45 lbs. and 6d. per load. Barley, Beans, and Peas were quite neglected, and nominally 2d. per 60 lbs. and 6d. to 1s. per qr. lower. Indian Corn met with little inquiry, although fine American yellow could have been bought fully 1s. per qr. cheaper than on this day se'nnight.——FRIDAY, JUNE 27.—This is the first week we have had of really summer weather, and, as a natural consequence, we have less spirit in the corn trade. The arrivals of grain and Flour since Tuesday are to a good extent, but the consumptive demand is greater. So far, there has been very little business here of a speculative character. The business at our Corn Exchange this day was limited, and the general quotations were more nominal than otherwise. Holders might have conceded slightly if buyers to a moderate extent had appeared.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-poor Paint ever invented, for the preservation of every description of Wood, Iron, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON and SON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange, London.

No Agents.—All orders are particularly requested to be sent direct.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abethaw Lime, and Roman Cement. Fine Black, 25*l.* per ton, and Rich Purple-brown, 20*l.* per ton.—Offices of the Company, 1, New Broad-st., London.—JOHN A. WEST, Secretary.

DR. NEWINGTON'S PATENTED AGRICULTURAL IMPLEMENTS. These Patents having been withdrawn from a firm under the name of DUFAUR and Co., in consequence of the unsatisfactory manner in which the inventions have been carried out, and the imperfect state in which the implements have been manufactured, have been assigned to Mr. GABRIEL, C.E., &c., of the Surrey Chambers, Arundel-street, Strand, London; agriculturists are informed that specimens of the Implements, viz.—The Hand Cultivators, Dibbles, Hand and Horse Drills, Manure Distributors, single-horse Ploughs, &c., can be seen there, as well as in the Agricultural Implement Department in the GREAT EXHIBITION, HYDE PARK. N.B. The Patent Dibble obtained the Prize awarded by the Royal Agricultural Society at Norwich, in 1849. Improvements have recently been made in the Drop Drills and Manure Distributors; they are lighter, can be turned round with ease, and there is a contrivance for stopping the escape of the seed at pleasure.—Catalogues, with engravings of the Implements, and numerous Testimonials, can be obtained upon application at the Surrey Chambers, Arundel-street, Strand, London.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus possesses greater general advantages than any yet submitted to the public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the apparatus. B. and H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. May be seen in daily use at the Craven Hotel, Craven-street, Strand; Stevens' Hotel, Bond-street; Greenwich Hospital; University College Hospital; and is in use by upwards of 200 private families, and at the Manufactory, 130, Fleet-street, London. A prospectus can be forwarded upon application, detailing particulars and price.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND CO., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING

Houses, Farm Buildings, Sheddings, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where Roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance of Westminster Hall, were roofed with F. M'NEILL and Co's Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

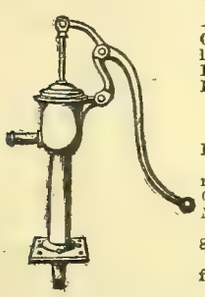
BOTANICAL AND OTHER BOOKS OF THE LATE DR. GARDNER.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King-street, Covent-garden, on FRIDAY next, the 11th inst., at 12 for 1 o'clock, the LIBRARY OF BOOKS of the late GEORGE GARDNER, Esq., Director of the Royal Botanic Gardens, Ceylon, comprising a general collection of Works on Natural History, but chiefly on Botany, by most of the modern authors of repute.—May be viewed on the day prior and morning of sale, and Catalogues forwarded on application.

BROOK STREET, CLAPTON.—Erection of nearly New Greenhouses, Greenhouse Plants, Under-duty Pony, Four-wheel Chaise, Two Carts, Harness and Effects.

MR. RICHARDS will Sell by Auction, on the Premises, Brook-street, between Stoke Newington and Clapton, on THURSDAY, July 10, at 12 o'clock, by order of the Proprietor (quitting the Premises), a nearly new Greenhouse, 21 feet by 12, and two others; 500 Plants in Pots, comprising Double Camellias, Geraniums, Roses, Heaths, Shrubs, &c.; Garden Tools, Double and Single Van Harness, Brewing Utensils, Useful Materials, &c. &c., on view.—Catalogues on the Premises, and of the Auctioneer, Tottenham, Middlesex.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.



Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

TO BE LET, Tithe Free, for a term of 8 or 12 years, a good Arable and Stock Farm, of 280 Acres, in a ring fence, within 4 miles of a Railway Station and a River Thames Wharf, and 43 miles from London, and 8 miles from an important Market town.—For particulars apply by letter, in the first instance, to Mr. WM. CHESTER, Hazelbeach, Northampton.

TO NURSERYMEN, FLORISTS, AND MARKET GARDENERS.—NORTH-END, FULHAM.

TO BE LET, 5 acres of WALLED GARDEN, with immediate possession. Ground well stocked with Trees and Bushes, and a very large stock of Moss and China Roses. The Land in good condition, and has thereon a Grapery, about 60 or 70 feet long.—For particulars, apply to Mr. ATWOOD, Auctioneer and Land Agent, Mortlake, Surrey; or at the "Rainbow," King-street, Covent-garden; and at HANDCOCK and YOUNG'S, 20, Tokenhouse-yard, City, back of the Bank; or at Mr. RUTTY'S, near the "Seven Stars," North-end, Fulham.

FARM AND COTTAGE PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

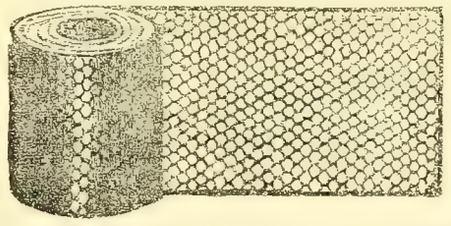
8, Crescent, Jewin-street, London.

Every description of Machinery for Raising Water, Fire Engines, &c. The usual allowance to the Trade.

MODELS OF FARM BUILDINGS IN THE GREAT EXHIBITION.

The *Times* of Wednesday last, has the following observations:—"Among miscellaneous contributions, the models of farm-buildings are worthy of particular attention. The want of accommodation in this last respect is perhaps the greatest evil of our present agricultural system. Go where you like, you rarely see substantial and well-arranged homesteads, and, generally speaking, there is a complete absence of a decent provision for the farmer's stock. We are glad to find in the Exhibition, contributions which are likely to be of service in this matter—if not by suggesting new and valuable ideas, at least, by directing attention to a point which is every day becoming more important." Among these models is one from Mr. John Baxter, of the *Sussex Agricultural Express*. Lewes, and Oaklands Farm, Ringmer, which, from its inexpensive character in erection, and excellent adaptation to the economising of labour in farm-yard management, has attracted the especial attention of those who aim at practical usefulness, rather than saving of labour by the application of expensive machinery. Farms of from 50 to 300 acres, will not find steam generally available, and what is wanted is a good system of farm-buildings for these establishments; and for these Mr. Baxter's models seem eminently calculated. We are glad to find that full details of his models, with diagrams, have been added to "Baxter's Library of Practical Agriculture," which popular work is now re-issued, and in the hands of the London Publishers, Messrs. Simpkin, Marshall, and Co., Stationers'-court, and Mr. Ridgway, Piccadilly.



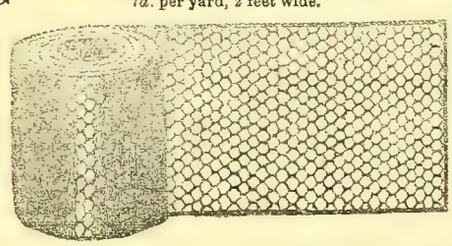
BAXTER'S LIBRARY OF PRACTICAL AGRICULTURE, in 2 vols., imperial 8vo., 3*l*.

[Also from *Bell's Weekly Messenger*, June 23.]

AGRICULTURAL FARM BUILDINGS.—Whatever may be the difficulty which we experience, under the present circumstances of agriculture, in directing the attention of our readers to plans or experiments which involve an additional outlay of capital, we cannot forbear calling to their notice the various models of farm buildings now on exhibition at the Crystal Palace. We do so, because we are sure that an alteration in this part of the economy of the farm has become almost a matter of absolute necessity, and also because we believe that it is only necessary for the subject to be placed before the great body of landlords throughout this country in a proper light, to induce them to meet the necessities of the times, either by erecting suitable farm buildings, or remodelling the present ones in a manner which experience has proved to be more advantageous to the tenant, and which must consequently be promotive of the interest of the landlord. Among the models which will well repay a careful examination, we may specially mention those designed by Mr. J. Baxter, of Lewes, and Oaklands Farm, Sussex, a gentleman whose practical acquaintance with agriculture is well known to many of our readers. These models have elicited the approbation of some of the most experienced farmers, and are highly spoken of by those most competent to form an opinion on the subject. We are glad to find that a full description of them, illustrated by diagrams, has been appended to the new edition of "Baxter's Library of Practical Agriculture," a work which justly ranks among the most useful to be found in the walks of modern agricultural literature.

Every gentleman connected with land, who does not already possess a copy of the above work, should avail himself of the present opportunity, for but few copies are left on hand.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.



GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

| | | | | | |
|---|---|---|---|---|---|
| 12 inches wide | 3*d*. | per yard. | 30 inches wide | 7½*d*. | per yard. |
| 18 ,, ,, | 4½*d*. | ,, | 36 ,, ,, | 9*d*. | ,, |
| 14 ,, ,, | 6*d*. | ,, | 48 ,, ,, | 1*s*. | ,, |

Galvanised do., 1*d*. per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s*. 6*d*. per running yard; if galvanised, 2*s*. Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s*. 10*d*. per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d*. per running foot; Flower Trainers, from 3*d*. each; Garden Arches, 20*s* each. Flower Stands, from 3*s*. 9*d*. each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

GALVANISED WIRE GAME NETTING.—7*d*. per yard, 2 feet wide.

| | Galvanised. | Japanned Iron. |
|---|---|---|
| 2-inch mesh, light, 24 inches wide ... | 7*d*. per yd. | 5*d*. per yd. |
| 2-inch ,, strong ,, ... | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, ... | 12 ,, | 9 ,, |
| 1½-inch ,, light ,, ... | 8 ,, | 6 ,, |
| 1½-inch ,, strong ,, ... | 10 ,, | 8 ,, |
| 1½-inch ,, extra strong ,, ... | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3*d*. per square foot. Patterns forwarded post free.

Manufactured by BARNARD and BISHOP, Market-place Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

EXHIBITION, CLASS 9, No. 89.

READ'S GARDEN ENGINES, MACHINES, &c., upon the last improved principle. Manufactured *only* by RICHARD READ,
Instrument Maker (by Special Appointment) to Her Majesty.
35, REGENT CIRCUS, PICCADILLY.

GREAT WESTERN RAILWAY.—ROYAL AGRICULTURAL SHOW AND GREAT EXHIBITION.—TO LONDON OR WINDSOR AND BACK.—Excursion Trains are appointed as follows, at Reduced Fares, during the week, from Bristol, Bath, Frome, Chippenham, Cheltenham, Gloucester, Stroud, and Cirencester, on the 14th, 15th, 16th, 17th, and 18th inst.

From Swindon, Shrivenham, Farringdon-road, Abingdon, Oxford, and Banbury, and intermediate Stations, Wallingford-road, and Pangbourne, on the 15th and 16th, and on the 17th to Windsor only.

TO WINDSOR AND BACK.

From Hungerford, Newbury, and other Stations, and from Basingstoke, Reading, Twyford, and Maidenhead, on the 16th and 17th inst.

The particulars of Fares, times of Departure and Return, and the number of Days allowed for Passengers coming to London, may be known on application at the several Stations, and parties are recommended to engage their Tickets beforehand, to ensure room for them in the Train.

GREAT WESTERN RAILWAY.—ROYAL AGRICULTURAL SHOW.—On Wednesday the 16th, and Thursday the 17th inst., there will be Special Excursion Trains for Visitors to WINDSOR AND BACK, and the Fares on those days will be—

First Class, 4*s*. 6*d*.; Second Class, 3*s*.; Open Carriages, 2*s*.

The Trains will run about every half hour from the Paddington Station, commencing at 6.30 A.M., until 12.30, and returning after 5 o'clock P.M., until 10.30 P.M.

NEW SHOW ROOMS FOR BEDSTEADS.

HEAL AND SON have erected some extensive Warerooms for the purpose of keeping every description of Bedsteads. In Iron their Stock will include every sort manufactured, from the cheap Stump, for servants' use, to the handsomely ornamented tubular-pillared Canopy, as well as Brass Bedsteads of every shape and pattern; and in wooden Bedsteads their Rooms are sufficiently extensive to allow them to fit up a variety, both in Polished Birch and Mahogany, of Fourpost, Canopy and French, and also of Japanned Bedsteads—in fact, to keep in Stock every sort of Bedstead that is made; and they have also a general assortment of Furniture, Chintzes, Damasks and Dimities, so as to render their Stock complete for the Furnishing of Bedsteads as well as Bedding. And without attempting to compete with the prices at which the lowest class of Furniture is sold, and which is fit for no useful purpose, their new Stock will be found to be priced on the same principle by which their Bedding trade has, during the last 30 years, been so successfully extended, and the goods, whether of a plain and simple pattern, or of a handsomer and more expensive character, are of well-seasoned materials, sound workmanship, and warranted.

HEAL and SON'S List of Bedding, containing full particulars of Weights, Sizes, and Prices of every description of Bedding, sent free by post, on application at their Factory,

196 (opposite the Chapel), Tottenham Court Road, London.

THE FOLLOWING WORKS ARE CONSTANTLY ON SALE AT THE OFFICE OF THIS PAPER.

SECOND EDITION, REVISED AND ENLARGED,
Price 5*s*. 6*d*., cloth,

ORNAMENTAL AND DOMESTIC POULTRY; their History and Management. By the Rev. EDMUND SAUL DIXON, M.A., Rector of Intwood with Keswick.

The Birds treated of are

NEW EDITION OF
PROF. LINDLEY'S INTRODUCTION TO BOTANY.
Recently published, in 2 vols. 8vo, with Six Copper-plates and numerous Wood Engravings, price 24s. cloth,
INTRODUCTION TO BOTANY. By Professor LINDLEY, Ph.D. F.R.S. Professor of Botany in University College, London, &c. Fourth Edition, with Corrections and numerous Additions.
EXTRACT FROM PREFACE.
In this new and enlarged Edition, the Author has followed very nearly the method recommended by the celebrated Professor De Candolle, than whom no man is entitled to more deference, whether we consider the soundness of his judgment in all that relates to order and arrangement, or the great experience which a long and most successful career of public instruction has necessarily given him.
The Author has begun with what is called ORGANOGRAPHY (Book I.); or an explanation of the exact structure of plants; a branch of the subject comprehending what relates either to the various forms of tissue of which vegetables are constructed or to the external appearance their elementary organs assume in a state of combination. It is exceedingly desirable that these topics should be well understood, because they form the basis of all other parts of the science. In physiology, every function is executed through the agency of the organs: systematic arrangements depend upon characters arising out of their consideration; and descriptive Botany can have no logical precision until the principles of Organography are exactly settled. A difference of opinion exists among the most distinguished botanists, upon some points connected with this subject, so that it has been found expedient to enter occasionally into much detail, for the purpose of satisfying the student of the accuracy of the facts and reasonings upon which he is expected to rely.
To this succeeds VEGETABLE PHYSIOLOGY (Book II.); or the history of the vital phenomena that have been observed both in plants in general, and in particular species, and also in each of their organs taken separately. It is that part of the science which has the most direct bearing upon practical objects. Its laws, however, are either unintelligible, or susceptible of no exact appreciation, without a previous acquaintance with the more important details of Organography. Much of the subject is at present involved in doubt, and the accuracy of some of the conclusions of physiologists is inferred rather than demonstrated; so that it has been found essential that the grounds of the more popularly received opinions, whether admitted as true or rejected as erroneous, should be given at length.
Next follows GLOSSOLOGY (Book III.); or, as it was formerly called, TERMINOLOGY; restricted to the definition of the adjective terms, which are either used exclusively in Botany, or which are employed in that science in some particular and unusual sense. The key to this book, as also to the substantive terms explained in Organography, will be found in a copious Index at the end of the volume.
It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.
London: LONGMAN, BROWN, GREEN, and LONGMANS.

BOTANICAL WORKS BY PROFESSOR LINDLEY.
THE VEGETABLE KINGDOM; or the Structure, Classification, and Uses of Plants; illustrated upon the Natural System. Second Edition. 500 Illustrations. Price 30s. in cloth.
"We assure our readers that it contains a vast quantity of matter interesting and useful to many classes of persons, and to none more so than to Pharmaceutists, to whom we strongly and cordially recommend it."—*Pharmaceutical Journal.*
THE ELEMENTS OF BOTANY, Structural and Physiological, with a Copious Glossary of Terms. Fifth Edition. 8vo. Price 12s., cloth.
This will complete the series of Elementary Botanical Works by Professor LINDLEY, of which "School Botany," and "The Vegetable Kingdom," form the other parts.
The first two Parts of THE ELEMENTS OF BOTANY, comprising Structural and Physiological Botany, and a Glossary of Technical Terms, are published in one octavo volume, price 12s.
These three parts form a complete manual of Botany for Medical and other Students who have made themselves acquainted with the author's "School Botany."
N.B. The Glossary may be had separately, price 5s.
CONTENTS.
PART I.—Chap. 1. General Attributes—2. Of the Elementary Organs—3. Of the Epidermis and its Processes—4. Of the Compound Organs—5. Of the Root—6. Of the Stem—7. Of the Leaf-Buds—8. Of the Leaves—9. Of Food and Secretions—10. Of the Motions of Fluids—11. Of the Flower-Bud—12. Of the Inflorescence—13. Of the Floral Envelopes—14. Of the Male Organs—15. Of the Disk—16. Of the Female Organs—17. Of the Receptacle of Torus—18. Of the Ovule—19. Of Fertilisation—20. Of the Fruit—21. Of the Seed—22. Of Germination—23. Of Flowerless Plants.
PART II.—Chap. 1. Linnæan Sexual System—2. Analytical Method—3. The Manner of Studying.—Glossary
*** The Elements of Medical and Œconomical Botany, illustrated with numerous diagrams and woodcuts, is now ready.

Lately published,
SCHOOL BOTANY; or, the Rudiments of Botanical Science. Price 5s. 6d. half-bound.
*** To suit the convenience of Students and others, the above Work is issued also in 12 Monthly Parts, price 2s. 6d. each.
MEDICAL AND ŒCONOMICAL BOTANY; Completing the Elements of Botany, Structural, Physiological, and Medical. 8vo. Price 14s., cloth.

PROFESSOR LINDLEY'S ŒCONOMICAL BOTANY.
This day is published, in one vol. 8vo, with numerous woodcuts price 14s.
MEDICAL AND ŒCONOMICAL BOTANY; or, An Account of the Principal Plants employed in Medicine or Domestic Œconomy.
EXTRACT FROM THE AUTHOR'S PREFACE.
"The Vegetable Kingdom contains, among a large quantity of plants of no known importance to man, various useful species employed in medicine, the arts, or in the many branches of domestic œconomy. The principal part of those which can be brought by teachers in Europe under the notice of students, or which, from their great importance, deserve to be among the earliest subjects of study, are mentioned in the following pages, where they are arranged in the manner proposed in the 'VEGETABLE KINGDOM' of the author, with the sequence of matter departed from in a few instances, when it was believed that the convenience of younger students would be consulted by doing so. The author trusts that this selection will be found to have been made in such a way that all teachers who possess reasonably extensive means of illustrating their lectures, and all Botanic Gardens, may furnish the larger part of the species which are mentioned. A small selection was indispensable; firstly, because a greater work would have been beyond the reach of the majority of purchasers; and secondly, because experience shows us that those who have to study a science of observation, such as Botany, require to concentrate their attention, in the first instance, upon a limited number of objects."
London: BRADBURY and EVANS, 11, Bouverie-street.

This day is published, 8vo, 6d.,
SHALL WE KEEP THE CRYSTAL PALACE, and have RIDING and WALKING in all WEATHERS, among FLOWERS, SCULPTURE, and FOUNTAINS?
By DENARIUS.
London: JOHN MURRAY, Albemarle-street.

Just published,
A THIRD EDITION OF MR. BABINGTON'S MANUAL OF BRITISH BOTANY. 12mo, price 10s. 6d. A few copies have been printed on thin paper for the pocket; the price of these copies, in circuit binding, is 12s.
London: JOHN VAN VOORST, 1, Paternoster Row.

THE QUARTERLY REVIEW, No. CLXXVII., is Published THIS DAY.

London: JOHN MURRAY, Albemarle-street.

Handsomely bound in cloth, with 93 Wood Engravings, Price 6s. 6d.,
ILLUSTRATIONS OF THE BIBLE, AND CONFIRMATIONS OF SACRED HISTORY, from the Monuments of Egypt. By W. C. TAYLOR, LL.D.
From the British Magazine.—"This is an elegant and well-executed little book, on a most interesting subject."
From the Birmingham Herald—"A valuable and indispensable accession to the library of every Biblical student."
From the Rev. Thomas Hartwell Horne's Introduction to the Critical Study of the Scriptures.—"Nearly 300 texts of Scripture are more or less explained in this elegantly-executed volume, and in a manner equally curious and interesting."

A SYSTEM OF POPULAR TRIGONOMETRY, both Plane and Spherical; with Popular Treatises on Logarithms, and the application of Algebra to Geometry. By GEORGE DARLEY, A. B. Second Edition. 3s. 6d., cloth.

Price 5s. 6d., cloth,
THE HISTORY OF THE UNITED STATES OF AMERICA. By JOHN FROST, of Philadelphia.

Price 7s. 6d., cloth,
THE HISTORY OF FRANCE, from the Earliest Period. By EMILE DE BONNECHOSE. The two volumes of the French edition comprised in the one of the translation. This work is the history approved of by the Minister of Public Education in France, where it has already passed through five editions. London: D. BOGUE, 86, Fleet-street.

ENGINEERING SCHOOL CLASS-BOOKS.
In crown 8vo, 4s. 6d. bound, with 220 Diagrams engraved for the Work,
EUCLID'S ELEMENTS OF PLANE GEOMETRY; with Explanatory Appendix and Supplementary Propositions for Exercise. Adapted for the Use of Schools, or for Self-instruction.
By W. D. COOLEY, A.B., Author of the "History of Maritime and Inland Discovery," "The Negro-land of the Arabs," &c.
"The editor has done all that could be done to make Euclid easy to beginners."—*Cambridge Chronicle.*
"Mr. Cooley seems almost to wish to contradict his own motto, that 'there is no royal road to Geometry,' for following in the steps of Playfair, he has considerably diminished both the volume of the work as well as the labour of the student. Prefixed to the Elements are some remarks on the study of mathematics, as valuable for the elegance of their style as for the correctness of their reasoning."—*Civil Engineer and Architect's Journal.*
"This is the best edition of the Elements which has yet appeared."—*Athenæum*—"which, for brevity, clearness, and discerning attention to the wants of learners, cannot be easily surpassed."—*Dublin University Magazine.*
"Will be found of considerable value as an aid to teachers of the Mathematics."—*New Monthly Magazine.*

Uniform with the 'Elements,' price 3s. 6d.
COOLEY'S GEOMETRICAL PROPOSITIONS DEMONSTRATED; or, a Supplement to Euclid: being a KEY to the Exercises appended to the 'Elements,' for the use of Teachers and private Students. Upwards of 120 Propositions reduced from the First Six Books of Euclid, are illustrated in it by new Diagrams.
WHITTAKER and Co., London.

A SYSTEM OF POPULAR GEOMETRY; containing in a few lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading Truths and general Principles. By GEORGE DARLEY, A.B. 5th Edition. 4s. 6d. cloth.

Lately published,
DARLEY'S SCIENTIFIC LIBRARY, for the Use of Schools, Private Students, Artists, and Mechanics.
It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics, these little works will be found particularly suited. The principles of the various Sciences are rendered as familiar, and brought as near to our commonest ideas, as possible; the demonstrations of propositions are made plain for the mind, and brief for the memory; and the Elements of each Science are reduced not only to their simplest but to their shortest form.

A SYSTEM OF POPULAR ALGEBRA, with a Section on Propositions and Progressions. By GEORGE DARLEY, A. B. Third Edition. 4s. 6d.

COMPANION TO THE POPULAR GEOMETRY; in which the Elements of Abstract Science are familiarized, illustrated, and rendered practically useful to the various purposes of Life, with numerous Cuts. By GEORGE DARLEY, A. B, second Edition. 4s. 6d. cloth.
TAYLOR, WALTON, and MABERLY, Booksellers and Publishers to University College, 28, Upper Gower-street, and 27, Ivy-lane, Paternoster-row, London.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church row, Stoke Newington, both in the County of Middlesex, Printers, at their Office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles street, in the parish of St. Paul's, Covent-garden, in the said County where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, JULY 5, 1851.

SCOTTISH GARDENERS AND LAND STEWARDS' ASSOCIATION.—At the Annual General Meeting of the Association, held on the 28th ult., ARCHIBALD SCOTT, Esq., in the Chair, it was resolved that THREE PENSIONERS be placed on the roll at the ensuing Election—that the time for applicants to send in their claims be extended to 1st August ensuing, and that the Election take place on the 28th of the same month.

CHARLES LAWSON, junior, HON. Sec.

*** Forms of application for Candidates may be obtained of the Secretary, 1, George IV. Bridge, Edinburgh, ; of Mr. THOMSON, Secretary to Glasgow Board, Trongate, Glasgow ; and of Mr. SOMMERS, Secretary to the London Board, 159, Fenchurch-street, London.

ROSES.

EDWARD DENYER, NURSERYMAN, Loughborough Road, Brixton, 3 miles from London, informs his kind patrons in general that his unrivalled collection of Roses reaching to nearly 1000 varieties, is now in bloom, and free to the inspection of all visitors, Sundays excepted. Orders taken at this time, and executed in November next. Fruit and Ornamental Trees, &c., may also be seen in great varieties.

E. D. informs his friends that he has no Seed Shop in London.

NEW AND CHEAP PLANTS SENT OUT THIS SPRING.

HENRY WALTON begs to inform his patrons and the public that he has printed descriptive lists of FUCHSIAS, VERBENAS, PETUNIAS, MIMULUS, CHRYSANTHEMUMS, &c., which he is prepared to offer at very low prices.

Lists may be had on application, enclosing a postage stamp, to Mr. WALTON, Edgend Marsden, near Burnley, Lancashire.

CHOICE CINERARIA SEEDS, saved from the newest and best varieties, at 1*s.* 6*d.*, 2*s.* 6*d.*, and 5*s.* per packet, post free, on receipt of stamps for the amount.

CARNATIONS AND PICOTEES.

C. TURNER'S extensive collection of the above beautiful flowers are now in full bloom, and may be viewed (Sunday excepted), till the end of the month. Parties visiting the Great Agricultural Show, at Windsor, will find ready conveyance by Great Western Railway or omnibus.

Royal Nursery, Slough, July 12.

THE SUBSCRIBER ceased (in terms of the Contract), to be a Partner of the Firm of JAMES DICKSON and SON'S Nursery, Seedsmen and Florists in Edinburgh, on the death of Mr. James Greig, on 25th December, 1850.

JAMES ALEXANDER.

3, Warriston-place, Edinburgh, 1st July.

J. RIVERS'S LARGE YELLOW STONE TURNIP SEED, is particularly recommended for very late sowing; it is much superior to any known variety of Yellow Turnip, for quickness of growth in its young state, hardiness in withstanding the winter, and keeping in the clamps until late in the spring, and for growing to a greater weight per acre. It originated from a cross between the Stubble Swede and the Green-top Stone; those of yellow flesh have been carefully selected, to make a distinct kind; price 1*s.* 6*d.* per lb.—Orders are respectfully requested to be addressed to JOHN RIVERS, Seedsman, Sawbridgeworth, Herts. A Post-office order is requested from unknown correspondents.—Sawbridgeworth, Herts.

TO NURSERYMEN AND GENTLEMEN PURCHASING PLANTS IN WHOLESALE NUMBERS.

THOMAS JACKSON AND SON respectfully invite attention to their very large stock of PLANTS IN POTS, which they are selling in wholesale numbers at extremely low prices; it consists of a general collection of Stove, Orchidaceous, Greenhouse, and Hardy Plants, and includes fine flowering plants of Erica ventricosa superba, do. carnea, do. tenuiflora, do. breviflora, do. coccinea minor, do. Bothwelliana, do. globera; propendens tubiflora, hyemalis, Willmoreana, Cavendishi, sulphurea, depressa, hybrida, perspicua nana, M'Nabiana, Eassoniana purpurea, vestita coccinea, mirabilis, &c. Epacris, strong bushy plants of most of the fine free-flowering sorts; Camellias of the finest kinds, well set with flower buds; Azalea indica, in fine variety; Achimenes and Gloxinias now showing full of bloom; large-flowered and Liliputian Chrysanthemums, of fine sorts, in immense quantity; large specimens and good flowering plants of the Japanese Lilies. Amongst the Hardy Plants (in pots), in great number, are Cedrus Deodara from 1 to 6 feet high; Araucaria imbricata, 1 to 4 feet; Juniperus chinensis, do. recurva; Cryptomeria japonica; Picea Douglasi, do. Brunoniana, do. pindrow, do. Webbiana; Pinus cembroides, do. Gerardiana, do. insignis, do. excelsa, 1 to 6 feet, do. Lambertiana; Taxodium sempervirens, 1 to 7 feet; Taxus adpressus, do. Dovastoni, do. gold striped; Escallonia macrantha; Ceanothus dentatus, do. rigidus; Ilex latifolia, 1 to 4 feet, &c.—Nurseries, Kingston, Surrey, July.

DUTCH FLOWER ROOTS.

J. G. WAITE'S PRICED CATALOGUE OF ROOTS is now ready, and can be had on application at his Seed Establishment 181, High Holborn, London.

NEW PELARGONIUMS.

CHARLES TURNER begs to inform growers of the above beautiful and very popular Flowers, that the entire stock of those first-rate new varieties raised and exhibited by E. FOSTER, Esq., Clewer Manor, and G. W. HOYLE, Esq., of Reading, are in his possession; plants of which will be ready the 1st of October next. Orders executed in strict priority as received, the stock of same being equal to a limited demand only. A descriptive List will shortly be ready.

Royal Nursery, Slough.

ABRAHAM HARDY AND SON, SEED GROWERS and SEEDSMEN, Maldon, Essex, beg to announce that their new Yellow Stone TURNIP, so well adapted for sowing early or late, storing and keeping as heretofore described; also their new white Underground Swede, for keeping and for culinary purposes, are now ready, and will be sent to any address at 1*s.* 6*d.* per quart. Norfolk Green Round and white Turnips, Laing's and Skirving's Improved Purple-topped Swedes, at 1*s.* per quart, packages included, and 5 per cent. discount for carriage. Terms cash.

JUDSON'S RICHMOND VILLA BLACK HAMBURGH VINE.

JOHN ANDREW HENDERSON AND CO. have the pleasure of informing their patrons and friends that it is their intention to send out this very excellent new Grape on the 1st Sept. next, at 21*s.* each.

Its distinguishing characteristics are as follows:—The foliage is more deeply serrated, and the wood shorter jointed than the Black Hamburgh; the berries are oval, and rather elongated, and are remarkable for a very fine bloom not unlike that of an Orlean Plum; when fully ripe are a fine deep black, having a fine rich flavour, and very juicy.

It colours full ten days earlier than the Black Hamburgh; being a most abundant bearer, and good setter, will prove a most desirable kind for pot culture. One very remarkable property this Grape possesses, which much enhances its value, and makes it so superior to the Black Hamburgh is, that it never produces abortive, or, as they are termed, vinegar berries; after careful observation, extending over three successive seasons, not one could be detected, although in each season the crop was abundant and good. The usual allowance to the Trade.—Pine Apple Place, Edgeware Road, London.

CHRYSANTHEMUMS.

STRONG PLANTS FOR EARLY FLOWERING.

BASS AND BROWN have a fine and strong stock of the above, and are enabled to offer them at the following low prices, comprising the best new sorts, very superb. They are in small pots and in strong growth for immediate shifting. They can be sent out by post, if desired, prepaid.

| | *s.* | *d.* |

G. and J. DEANE are sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with the Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom.

Also, wholesale and retail Agents for Saynor's celebrated Pruning Knives, used exclusively by the first gardeners in the United Kingdom. GEORGE and JOHN DEANE (opening to the Monument) London Bridge.

HORTICULTURAL SOCIETY OF LONDON.—The Proprietors of the GARDENERS' MAGAZINE OF BOTANY beg to announce that, by the kind permission of the Council of the Horticultural Society, the following PRIZES, as offered in that work, Vol. 2, p. 46; and the "Florists' Guide," p. 102, for best 12 PICOTEES exhibited in pots, viz.—

1st Prize, "Gardeners' Magazine of Botany," Vols. 1 and 2;
2d Prize, "Gardeners' Magazine of Botany," Vol. 1;
3d Prize, "The Florists' Guide," Vol. 1;

will be given to the three Exhibitors who may stand first according to the awards of the Society's Judges, on Saturday, July 19. The plants must be in the Garden before half-past 8 o'clock.—July 12.

GLASS.

GLASS FOR PIT FRAMES, HOTHOUSES, &c. in Boxes of 100 feet, 8*s.* 6*d.* each.

4½ by 3 ... 5 by 2½ ... 6 by 2½ ... 6 by 3½ inches.
4½ by 3 ... 5 by 3 ... 6 by 3 ... 6½ by 3
4½ by 3½ ... 5½ by 3 ... 6½ by 3 ... 6½ by 3½

Larger Squares increase in price according to size. Every size kept ready packed in boxes, and may be had at a moment's notice.

Extra Crown, Sheet, and Patent Rough Plate Glass, cut to size for Conservatories, Greenhouses, &c.

Gardeners and others glazing on Mr. Paxton's plan can be supplied with Sash-bars of any length for the purpose.

PROPAGATING, CUCUMBER, FERN, PEACH, and every description of Garden Glasses.

Bailiffs, Farmers, Dairymen, and others supplied with Lord Camoy's Milk Syphons, Milk Lactometers, Glass Milk Pans, Glass Tiles, Slates, &c., &c., for collections of which Messrs. COGAN and Co. were honoured with the Silver Medal of the Dublin Society, as also the Silver Medal of the Liverpool and Manchester Society held at Warrington in September last.

For Estimates, Prices, and further particulars, please address Messrs. COGAN and Co., 48, Leicester-square, London.

Glass Shades, Gas Glasses, White Lead, Colours, &c., as usual.

GLASS WATER PIPES.

MESSRS. COATHUPE AND CO., CROWN and SHEET GLASS MANUFACTURERS, Nailsea, near Bristol, Somerset, beg to inform Engineers and others that they are supplying GLASS PIPES, with their Joints, from 1 to 4 inches bore, capable of bearing very great atmospheric pressure, in lengths from 3 to 7 feet, the lengths being less as the diameter of the bores increase. These Pipes may be seen at the Exhibition (Class 24, Section 47), with their forms and modes of joining, in the Section allotted to the Glass Manufactures; and references can be given of their great utility in numerous localities, where they have been successfully employed. The great advantage of Glass Pipes for the conveyance of pure water over all metallic substances, has been too largely dwelt upon by medical and scientific authorities to require any further comment.

Nailsea Glass Works, near Bristol.

MARQUEES, Tents, and Flags, for SALE and on HIRE. Rick, hay, and waggon cloths; ropes, twines, and sacks; cocoa matting and mats. Manufacturers by Royal Letters Patent: MORISON and HURN, 25, Norton-falgate.

PEACH AND ORCHARD GLASSES.

HALLIMAN'S REGISTERED FRUIT PROTECTORS are now offered at 42 per cent. less than the former price:

| | | |
|---|---|---|
| Glasses, 4 inches diameter | 6s. 6d. | per dozen. |
| ,, 6 inches ,, | 9 0 | |
| ,, 8 inches ,, | 15 0 | |

By the use of these Glasses the Fruit on the wall grows to a much larger size, wasps and flies are effectually kept out, and the Fruit when ripe cannot fall to the ground. Wasp Traps, 3s. 6d. per dozen.—To be had only of JAMES PHILLIPS and Co., 116, Bishopsgate-street Without, London.

HORTICULTURAL TOOL WAREHOUSE.

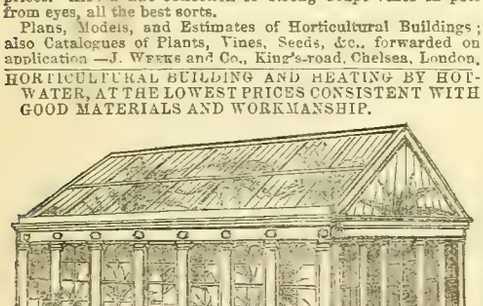
GREEN AND CONSTABLE, WHOLESALE AND RETAIL IRONMONGERS, 36, King William-street (four doors from London Bridge), beg to inform Amateurs and Gardeners they have a large assortment of new and improved Garden Tools, including Lyndon's Patent Spades, Lord Vernon's Patent Hoes, jointed Hothouse Syringes, Galvanised Iron Garden Engines, Transplanting Tools, Patent Water-pots, Brown's Patent Fumigator, Improved Garden Labels and Sticks; also a large assortment of Saynor's Pruning and Budding Knives.

GREENHOUSES.

HENRY FREEMAN, HOTHOUSE BUILDER, and HOT WATER APPARATUS MANUFACTURER, Triangle Hackney, London, begs to solicit the attention of the gentry to his low prices for cash. Good substantial-built Greenhouses, fixed complete, 42 feet long by 13 feet wide, 9*l.*; 21 feet long by 13 feet wide, 50*l.*; 12½ feet long by 10 feet wide, 30*l.* A large assortment of Conservatories, Hothouses, Pits, Melon and Cucumber Boxes, Iron Hand-lights, Summer-houses, Seats, &c. Estimates in the above line, either in wood or iron.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP, AT THE LOWEST POSSIBLE PRICES.



J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT-WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which for elegance of design, good materials and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot-Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

GALVANISED SHEET-IRON GREENHOUSES, HOTHOUSES, CONSERVATORIES, &c.

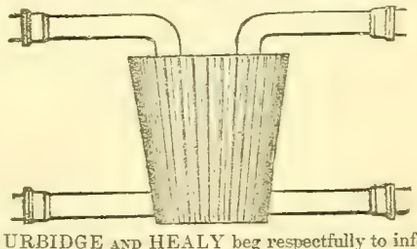
E. DENCH, Inventor, Patentee, and Sole Manufacturer, King's-road Chelsea. The superiority of these Houses having been fully proved in all parts of the Kingdom, references can be given in every instance where a Patent House has been erected. E. D. has several Patent Greenhouses for sale, and some as low in price as 1*s.* 2*d.* per foot super.—making a Greenhouse fitted complete with excellent glass, 8 foot long, 1 foot wide, and delivered to wharf or station free 25 feet 6 in. long, 16 feet 6 in. wide, 13 feet high at back, 5 feet 6 in. high at front, length of rafter 15 feet, with two ends and doors, amount to but 850 feet, which, at 1*s.* 2*d.*, is 49*l.* 11*s.* 8*d.* Heating by Hot-water.

STRAWBERRIES AND FRUIT TREES.—TANNED GARDEN NETTING, for protecting the above from birds, or as a fence for fowls, pigeons, Turnip seed beds, from JOHN KING FARLOW'S fishing tackle and net manufactory, 5, Crooked-lane, London-bridge, at 1½*d.* one yard, 3*d.* two yards, or 6*d.* four yards wide. Forwarded, carriage free, on all orders over 20*s.*, accompanied with post-office order or stamps.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H.R.H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, Chinese, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, spotted and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

AYLESBURY DUCKS (White).—The Advertiser has for Sale a limited number of the above, in fine healthy birds, of this season; the breed is warranted pure and of the largest known, weighing, when fattened, 8 lbs. to 10 lbs. each. Price, including package, 8*s.* 6*d.* per couple.

Also a few of the largest breed of NORFOLK GEESE, 12*s.* per couple.—Orders, accompanied by Post-office orders or reference, addressed to ISAAC BRUNNING, North-end, Great Yarmouth, will receive prompt attention.



PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers: Office, 70, Strand, London.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

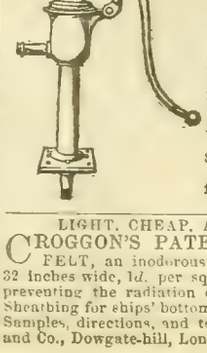
REDUCTION IN THE PRICE OF BOILERS.

BURBIDGE AND HEALY beg respectfully to inform their Friends, in consequence of the present reduced price of Iron, they are enabled to make a considerable reduction in the price of their Boilers. The price will be, now:

| | | | |
|---|---|---|---|
| 10 in. will warm | 50 ft. 4 in. pipe | ... £1 | 15 0 |
| 12 in. do | 75 ft. 4 in. do. ... | ... 2 | 5 0 |
| 14 in. do. | 100 ft. 4 in. do. ... | ... 2 | 15 0 |
| 16 in. do. | 150 ft. 4 in. do. ... | ... 3 | 10 0 |
| 18 in. do. | 250 ft. 4 in. do. ... | ... 4 | 10 0 |
| 21 in. do. | 350 ft. 4 in. do. ... | ... 5 | 10 0 |
| 24 in. do. | 450 ft. 4 in. do. ... | ... 7 | 0 0 |

NEW PATTERN BOILERS.

| | | | |
|---|---|---|---|
| 30 in. will warm | 800 ft. 4 in. pipe | ... 15 | 15 0 |
| 36 in. do. | 1500 ft. 4 in. do. ... | ... 25 | 0 0 |



All Boilers with double arms, up to 18 in., 5*s.* extra; to 24 in., 10*s.* extra; all above, the same price.

130, Fleet-street, London.

DR. NEWINGTON'S PATENTED AGRICULTURAL IMPLEMENTS.—These Patents having been withdrawn from a firm under the name of DUFAUS and Co., in consequence of the unsatisfactory manner in which the inventions have been carried out, and the imperfect state in which the implements have been manufactured, have been assigned to Mr. GABRIEL, C.E., &c., of the Surrey Chambers, Arundel-street, Strand, London; agriculturists are informed that specimens of the Implements, viz.—The Hand Cultivators, Dibbles, Hand and Horse Drills, Manure Distributors, single-horse Ploughs, &c., can be seen there, as well as in the Agricultural Implement Department in the GREAT EXHIBITION, HYDE PARK. N.B. The Patent Dibble obtained the Prize awarded by the Royal Agricultural Society at Norwich, in 1849. Improvements have recently been made in the Drop Drills and Manure Distributors; they are lighter, can be turned round with ease, and there is a contrivance for stopping the escape of the seed at pleasure.—Catalogues, with engravings of the Implements, and numerous Testimonials, can be obtained upon application at the Surrey Chambers, Arundel-street, Strand, London.

TURNIP HOEING.—A man can hoe 2 acres per day with the Cultivator, and it is used for all other crops.

FARM AND COTTAGE PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

| | |
|---|---|
| Patent Pump ... ... | ... £1 16 0 |
| Patent Pump, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing ... ... | ... 2 12 0 |

Larger sizes if required.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers.

JOHN WARNER & SONS, 8, Crescent, Jewin-street, London.

Every description of Machinery for Raising Water, Fire Engines, &c. The usual allowance to the Trade.

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT, an inodorous felt for damp walls, sold in rolls 32 inches wide, 1*d.* per square foot; also dry Hair Felt, for preventing the radiation of heat and deadening sound, and Sheathing for ships' bottoms, on which the copper lies smooth. Samples, directions, and testimonials, sent by post.—CROGGON and Co., Dowgate-hill, London.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of hearing for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

MAYFIELD, SUSSEX,

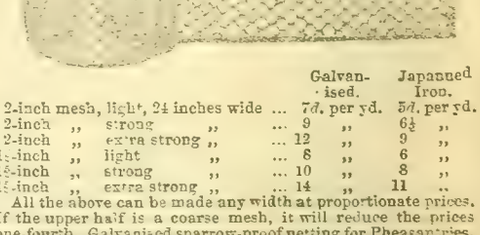
TO BE LET, together or separately, on Lease, at Michaelmas next, TWO DESIRABLE FARMS, with advantages for occupation seldom to be met with, each containing a out 170 Acres of Arable, Hop, Meadow, and Pasture Land, in the usual proportions. The above Farms have long been celebrated for their excellent growth of Hops, and the present plantations are in their prime. They will be let tithe free; are close to an intended Railway Station; and a good Tenant will meet with every encouragement from the Landlord. Hares and Rabbits not preserved.

For further particulars, and to treat for the hiring, apply to Mr. WILLIAM EVANS, the Gate House, Hurst Green, Sussex.

TO MARKET GARDENERS AND OTHERS.—NEAR HOUNSLOW.—TO BE LET.

MR. STRANSOM has instructions to Let on Lease 15 Acres of excellent GARDEN GROUND (in one plot), broken up about two years since, and part well stocked with Fruit Trees. The stock, &c., to be taken at a valuation. Rent moderate.—For further particulars, apply to Mr. STRANSOM, Auctioneer and Valuer Uxbridge, Middlesex.

PARTNERSHIP.—WANTED, in an old-established NURSERY, an active PARTNER, who can command about 200*l.* Owing to the recent death of a Partner, and other arrangements, a person possessed of such a capital would find the offer very advantageous.—For particulars, apply to Messrs. LUCAS and SHOWLER, Solicitors, 1, Trinity-place, Charing-cross, London.



PATENT GARDEN NETS.—The Subscribers beg to inform Noblemen and Gentlemen that they have now on hand a large stock of Nets suited for Garden purposes. A Net calculated to cover an area of about 600 square yards will cost 60*s* net. Other sizes, in proportion. Orders promptly attended to.—J. and W. STUART, Patent Net Factory, Musselburgh, July 12.

FOWLER'S PATENT DRAINING PLOUGH may be seen at work every day, between the hours of 9 and 6 o'clock, during this month, at Wormwood Scrubbs, near Shepherd's Bush, on the Uxbridge-road, about three miles from Hyde Park.

DRUMMOND'S REAPING SCYTHES.—These Scythes continue to give the greatest satisfaction, and for cutting down all sorts of corn with expedition and without waste of steam cannot be surpassed; price 9*s.* each. Orders promptly executed by W. DRUMMOND and SONS, Agricultural Museum, Stirling, N. B.

N.B. When three or more of the Scythes go together, the expense of carriage to the principal ports and Railway Stations in the kingdom will not exceed from 6*d.* to 1*s.* each.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

| | | Galvanised. | Japanned Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24 inches wide | ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch ,, strong ,, | ... | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, | ... | 12 ,, | 9 ,, |
| 1½-inch ,, light ,, | ... | 8 ,, | 6 ,, |
| 1½-inch ,, strong ,, | ... | 10 ,, | 8 ,, |
| 1½-inch ,, extra strong ,, | ... | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD and BISHOP, Market-place Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

GREAT WESTERN RAILWAY.—ROYAL AGRICULTURAL SHOW AND GREAT EXHIBITION.—TO LONDON OR WINDSOR AND BACK.—Excursion Trains are appointed as follows, at Reduced Fares, during the week, from Bristol, Bath, Frome, Chippenham, Cheltenham, Gloucester, Stroud, and Cirencester, on the 14th, 15th, 16th, 17th, and 18th inst.

From Swindon, Shrivenham, Farringdon-road, Abingdon, Oxford, and Banbury, and intermediate Stations, Wallingford-road, and Pangbourne, on the 15th and 16th, and on the 17th to Windsor only.

TO WINDSOR AND BACK.

From Hungerford, Newbury, and other Stations, and from Basingstoke, Reading, Twyford, and Maidenhead, on the 16th and 17th inst.

The particulars of Fares, times of Departure and Return, and the number of Days allowed for Passengers coming to London, may be known on application at the several Stations, and parties are recommended to engage their Tickets beforehand, to ensure room for them in the Train.

GREAT WESTERN RAILWAY.—ROYAL AGRICULTURAL SHOW.—On Wednesday the 16th, and Thursday the 17th inst., there will be Special Excursion Trains for Visitors to WINDSOR AND BACK, and the Fares on these days will be—

First Class, 4*s.* 6*d.*; Second Class, 3*s.*; Open Carriages, 2*s.*

The Trains will run about every half hour from the Paddington Station, commencing at 8.30 A.M., until 12.30, and returning after 5 o'clock P.M., until 11.30 P.M.

HOUSE FURNISHING AND INTERIOR DECORATIVE ESTABLISHMENT, 451, OXFORD-STREET, LONDON.—Cabinet Furniture of every description at marked prices.—Brussels Carpets, 2*s.* 6*d.* per yard.—Damask Curtains, 1*l.* per pair and upwards; Ditto, in silk and Worsted (French fabric), nearly two yards wide, at 8*s.* per yard.—The best Floor Cloths that can be made, cut to any dimensions 2*s.* 8*d.* per yard. The largest Manufactory in London for Paper Hangings, English and French Decorations, adapted either to the Cottage or the Mansion, fitted up, showing the side of a room finished for occupation.

HORTICULTURAL SOCIETY OF LONDON.—His Grace the Duke of Devonshire, President of the Horticultural Society, has kindly directed the Grounds of Chiswick House to be opened for the reception of the Visitors to the Society's Gardens at the NEXT EXHIBITION, on SATURDAY, the 19th JULY. Tickets are issued at this Office, price 5s; or at the Garden, in the afternoon of the 19th July, at 7s 6d. each. Respectable strangers, or residents in the country, who will forward their addresses in writing to the Vice-Secretary, 21, Regent-street, on or before Thursday, the 17th of July, may obtain from that Officer an authority to procure Tickets.

Messieurs les étrangers qui désireront se procurer des billets d'admission pourront en obtenir des mandats en s'addressant à leur Ambassade ou à leur Consulat.

21, Regent-street, London.

THE LONDON FLORICULTURAL SOCIETY.—The next Meeting under this Society for the EXHIBITION OF SEEDLINGS of every class of Florists' Flowers, and Class Showing for the under-mentioned Flowers, will take place at Exeter Hall, Strand, on TUESDAY, the 22d instant, at 12 o'clock:—

CARNATIONS (cut flowers), in 6 Classes.—Scarlet Flake, Rose Flake, Purple Flake, Pink and Purple Bizarre, Scarlet Bizarre, and Crimson Bizarre.

PICOTEES (cut flowers), in 4 Classes.—Rose edge, Purple edge, Red edge, and Yellow Ground.

FUCHSIAS (in pots), in 3 Classes.—Light tube, Dark tube, and Purple Corolles.

VERBENAS (cut flowers), in 3 Classes.—Light, Dark, and Fancy.

PETUNIAS (cut flowers), in 3 Classes.—Light, Dark, and Striped.

All Flowers to be ready for the Censors by 1 o'clock.

45, Lime-street, July 12. J. W. Jewitt, Hon. Sec.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.—Under the Patronage of her Most Gracious Majesty the Queen.—The FOURTH EXHIBITION for the season will be held at the ROYAL SURREY ZOOLOGICAL GARDENS, on Thursday, 24th July (open to all Exhibitors), when prizes will be awarded for the following productions, viz., Miscellaneous and Specimen Plants, Cape Heaths, Fuchsias, Roses, Carnations, Picotees, Verbenas, Cut Flowers, Fruit, and Honey. In addition to the Prizes offered by the Society, W. T. Iliff, Esq., offers a Small Silver Linnæan Medal for the best collection of 30 cut specimens of Indigenous Plants. By Mr. J. Marriott, of Gracechurch-street, for the best glass of Honey in the Comb, the Large Silver Victoria Medal. Also, by subscription, prizes for Seedling Antirrhinums, Calceolarias, Carnations, Picotees, and Petunias, in addition to Certificates granted by the Society.—Lists of Prizes and the Rules for Exhibitors may be obtained from John Taylor Neville, Ebenezer House, Peckham, Surrey. Secretary.

# The Gardeners' Chronicle.

*SATURDAY, JULY 12, 1851.*

MEETINGS FOR THE ENSUING WEEK.

Saturday, July 19—Horticultural Gardens .....2 P.M.

Country Shows.—Wednesday July 16: Arbroath Horticultural.—Friday, July 18: Beccles Horticultural.

It is evident that the history of the rot in Larch is not yet complete. It is admitted that in wet situations the rot is most prevalent, and that Larch when planted there has no chance of escape from the disease. But facts seem to prove that rot will appear even when drainage is perfect. Cases have been mentioned where this malady has appeared elsewhere than in the roots, and where trees have been growing on dry hill sides. We have no doubt of it. A storm which loosens and breaks the roots, a hailstorm when the shoots are pushing, imprudent thinning which leaves the trees top-heavy, have been pointed out as other causes; and we believe with perfect justice.

Whatever shall produce decay in the tissues will favour the appearance of dry rot fungi; dry rot fungi rapidly increase a mischief which might be unimportant in their absence; wet situations *invariably* bring on incipient decay, and more especially favour the progress of dry rot fungi; therefore wet situations are necessarily among the principal causes of the rot in Larch.

Of course we do not deny that disease, to be followed by the rot, may appear in situations apparently most favourable for the growth of Larch. Disease occasionally attacks living things, under all circumstances. Cholera prevails in low damp places near putrifying matter, and there it is said to be most malignant; but we know that it also appears in high dry places, amidst an atmosphere not impure. The first is the rule, the last the exception. So it is with Larch; the rot attacks it invariably in ill-drained places; there the malady is inevitable; rot also attacks it in well-drained places, and there the malady is accidental.

That Larch may be affected under circumstances the reverse of wet has been shown by our invaluable correspondent, the Rev. M. J. Berkeley, to whose kindness we owe the following communication:—

"A specimen of diseased Larch has lately been sent to me from Wentworth by Mr. Henderson, which appears to be highly worthy of attention. The trees amongst which the disease occurs grow on a sort of blackish shale, which is taken out of the iron-stone pits and made into little round hills, which are afterwards planted. The composition of the hills should seem to insure good drainage, and the disease, indeed, does not seem, as in many cases, to commence at the roots, but in the centre of the trunk. The wood, in the decayed portions, is mottled with little white spots, which often run in longitudinal lines, though seldom so confluent as not to retain somewhat of their original form, which is, however, sometimes obliterated.

"These spots do not consist, as might at first be supposed, of mere mycelium, but of the tissues of the plant which are bleached and shining; and whether woody tissue, medullary rays, or dotted tubes, they are as completely separated from each other as if the connecting matter had been dissolved by some chemical substance. They are, in consequence, very nice objects for the microscope, and call to mind the disintegrated fossil wood which occurs in the trap rocks of Tasmania. Though a common lens fails to detect anything like fungus threads, a very attentive examination exhibits extremely minute filaments, which are evidently of fungous origin, both in the interior and on the surface of the tissue, but in general so obscure as to require great caution before coming to any positive decision. Few tissues, perhaps, of decaying or decayed vegetables are without some traces of fungi, instances of which have been published by Reissek and others, who have paid especial attention to the subject; but we must not, therefore, conclude in every case that the fungi are the cause of the decay. In the present instance we observe the tips of the dotted tubes to be frequently distorted or forked, a circumstance which is worthy of more minute investigation.

"The specimen is interesting too, as I conceive, in a different point of view—viz., as giving an excellent instance of the wisdom of not trusting to mere appearances. Ninety-nine persons out of a hundred would at once declare the white spots to consist of mycelium, and we are free to confess that had we not possessed a specimen of the Tasmanian wood mentioned above, we should not have submitted the tissue to the microscope, but should have passed it over as an ordinary case of wood traversed by mycelium.

"I have given in the above figure a representation of portions of two of the dotted tubes, exhibiting mycelium on their inner and outer surface."

Mr. Henderson adds in a letter which has just reached us, that "the roots of the Larch trees growing on the ironstone hills, as above described, are not exposed to much wet, but on the contrary are rather dry. They grow on little hills, composed of what is called *bind*, which is brought up with the ironstone and remains on the surface after the pits are filled up. It takes some years to decompose, before it is fit for growing trees, and ultimately becomes something like a strong blue clay. Beech and Spanish Chesnut thrive pretty well on it, but Firs do badly, and Larch is subject to the rot. Between the hills, where the trees grow in the natural soil, they are not subject to the disease, although the land is in some places wet and springy; and he is therefore induced to think, that as far as the Wentworth trees are concerned, a wet bottom is not the cause of the disease, but rather some injurious quality in the soil itself."

This explanation, received after the previous remarks had been sent to press, may be compared with the view taken by us in the commencement of the present article. It seems to show that disease may appear where land is thought to be well drained. But we doubt whether stiff blue clay, necessarily very retentive of moisture, however dry it may become in the autumn, can be otherwise than wet in the early part of the year, when the Larch is making its growth, and when, therefore, the mischief is done.

---

It is an excellent custom in certain foreign countries, and one which leads to very valuable results, to send from time to time scientific men to travel in the various neighbouring kingdoms; they are sent with a specific object, they carefully investigate the matter to which their attention is directed, and on their return, they make a report to the Government who sent them, embodying the facts which they have collected in their travels, and the conclusions at which they have arrived; these reports, which are generally drawn up by men eminently well qualified for the task, often present better and more impartial views of the particular manufactures of the kingdoms so visited, than could possibly be prepared by any one residing in them. There is a good illustration of the truth of this, in the skilful reports lately drawn up by M. Payen, by desire of the Minister of Agriculture and Commerce of France, on drainage, the use of peat, and the employment of artificial manures in England. These reports, written by an excellent observer, one who is intimately acquainted with all the various departments of scientific agriculture, and the economy of vegetation in general, are of the highest interest and importance.

If, however, a stranger visiting England for such a specific purpose comes with the advantage of an unprejudiced and unbiassed judgment, he has at the same time the disadvantage that he does not always know in how far he may safely rely on the statements which are made to him, and he therefore runs considerable risk of being misled by false or erroneous information. The conclusion which M. Payen appears to have arrived at, from a very careful study of the present state of the manufacture of artificial manure in England, and of the results of numerous experiments on the practical application of those manures, might probably be expressed as follows. A dozen years ago it was stated by Liebig and his followers that the great object of all artificial manures was to supply certain inorganic matters to growing plants. It was asserted that soils became exhausted from the abstraction of potash, phosphoric acid, and soluble silica, and it was therefore said that manures were chiefly valuable in proportion to the quantity of those substances which they contained. The experience of the last few years has, however, shown that this is not really the case, for the most careful and satisfactory experiments have proved, that soils are very seldom wanting in the inorganic elements of plants, such as phosphoric acid and alkalies; but that they are often deficient in nitrogen, in a state capable of being assimilated by plants. In other words, that ammonia and nitric acid are far more important components of manure than phosphoric acid or alkalies.

That Liebig did, at one time, attribute very great importance to the earthy and alkaline parts of manure, no one will deny; and, indeed, it is evidently proved, by the fact that he even became the originator of a patent mineral manure, which, as Payen remarks, has for the most part been found of comparatively little real value. If, however, it is acknowledged on the one hand, that the value of these inorganic manures has been over-rated, it must, however, at the same time be admitted that there are circumstances under which they produce very remarkable effects; and that even though it is proved that they are not the only things necessary to the growth of plants, or the only things which the cultivator has to add to the soil, it does not, therefore, follow that they are of no value at all; and we ought to take care that in acknowledging our error, we do not fall into the opposite extreme.

It has been all along known, that the very best manures were those which contained a mixture of organic and inorganic matters; substances, such as common farm-yard manure, consisting of decomposed and decomposing animal and vegetable materials, intimately mixed together. The error which has been committed consisted in the attempt to compare perfectly different and opposite things; and to decide which of the two was the most important. The alkalies and phosphoric acid are, no doubt, quite essential to the growth and well-being of plants; but so also are ammonia, nitric acid, and the various other sources of nitrogen. To attempt to compare the two kinds of food, is pretty much as though we were to try and compare together meat and bread, as articles of animal food; both are valuable, and the two taken together are more valuable than either taken alone. So it is with plants; it is of no use attempting to determine whether ammonia or alkaline phosphates are the most important, as constituents of manure; they serve very different objects in the nutrition of plants, and when the one is required, it is certainly idle to attempt to supply its place, by giving more of the other.

There are a number of curious experiments which have at times been quoted, as proving that the organic part of common yard manure is of no value; and that its virtue consists entirely in the inorganic salts which it contains. Thus, for example, it has been stated, that on manuring two equal pieces of ground, the one with a certain weight of good farm-yard manure, and the other with the ashes of an equal quantity of the same manure, no difference could be subsequently observed between the crops raised on the two fields. The truth of this, again, has been called in question by other experiments, the results of which were just the reverse; and those who attempted to draw general conclusions from the two experiments, were at last fairly puzzled how to reconcile two apparently diametrically opposite statements. The real cause of the difficulty, however, was simple enough; it arose merely from the attempt to compare together dissimilar things, which, from their very nature, could not fairly be contrasted with one another. If we admit that which is now pretty well generally acknowledged, namely, that all plants, in addition to certain other substances, require both ammonia and also alkaline phosphates, it is very easy to perceive, not only that

a manure containing both those substances must be generally valuable, and therefore more certain in its effects than a manure which contains only one or the other; but also that such a manure would act in a very different manner on different soils, and applied to different plants. For example, good farm-yard manure, applied to a soil rich in earthy phosphates, and abounding in bone earth, will, nevertheless, be found to do good, and cause the plants cultivated in it to grow with increased vigour and luxuriance; not because of the phosphoric acid which it contains, but chiefly from the presence of a certain quantity of ammonia, nitric acid, and matters capable of yielding those substances by their putrefaction. Nevertheless, the same manure, applied to a soil containing no phosphoric acid, but artificially supplied with salts of ammonia, will also be found to act beneficially; in this case it is not the ammonia, but the phosphoric acid of the manure, which is of importance. Or, if in place of applying a mixed manure such as we have imagined, to these two soils, we were to take simple chemical manures —say phosphate of lime and sulphate of ammonia, we should probably find, that upon the one soil the phosphoric salt was the best manure, whilst upon the other the salt of ammonia would produce the best effect. It is plain, then, that the value of these different elements of manure must depend on the wants of the plant, and on the capabilities of the soil.

The conclusion, therefore, to which M. Payen arrives, namely, that the mineral manures, consisting chiefly of phosphate of lime, and containing little or no organic matter, are of comparatively trifling value, and that they act so slowly as to be of small profit to cultivators, is perhaps rather too sweeping a condemnation. Undoubtedly they will not supply the place of ammonia, but at the same time they are valuable manures, and on certain soils the cost of their use is amply repaid, especially when they are employed in conjunction with animal or ammoniacal manures. In the composition of artificial manures, M. Payen fully admits the value of sulphuric acid as a solvent of phosphate of lime; and he insists strongly on the great practical value of charcoal, when associated with rich animal manures.

In concluding his report, M. Payen well observes, that there is one thing wanting which would be a very great aid to the cultivator, and that is, that all artificial manures should be designated by plain and simple names, expressing their real nature, and that their exact chemical composition should be honestly stated, as their purchasers would be no longer deceived by mysterious names, or misled by vexatious uncertainty as to the real value of the manures they buy. On this point there can be no doubt as to the evil, though the remedy may not be quite so clear. Perhaps the best advice which can be given is this—buy only of respectable dealers, and do not be deceived by *cheap* manures; if you are tempted by what is termed a bargain, you are pretty sure to suffer in the end; good manure is well worth its fair market value; the trash which dishonest dealers sell you is often not worth having as a gift.

## SPRING FROSTS AND FRUIT GROWING.

This is the fifth consecutive spring in which the hopes of the orchardists have been blighted by severe late frosts. In 1846 they commenced. We had in that year a very forward spring, for on February 26 the blossom-buds of the Pears were bursting, and Roses were showing their flower-buds; but on March 20, the thermometer registered 18°, or 14° of frost; the Pear-buds were frozen through, and nearly all failed.

1847, *April* 16.—Thermometer registered 22°, or 10° of frost, the blossom-buds of Pears had not burst; but in spite of that, all the Marie Louise were destroyed. Of other sorts, the crop was tolerably abundant.

1848, *April* 27.—A sharp hoar-frost, thermometer registered 27°, or 5° of frost; nearly all the Pear blossom destroyed. They were in full bloom, and owing to the beautiful and favourable weather in the early part of the month, gave high promise of an abundant crop. Alas! all, or nearly all, failed. This was a very early and very agreeable spring; for on May 14, I gathered a fine bunch of Roses (Madame Laffay and Baronne Prevost), from the open borders.

1849, *April* 16.—After a spring-like January and February, winter paid us a visit; on this day a heavy fall of snow took place, and on the 18th, a sharp wind frost; thermometer registered 19°, or 13° of frost. Many varieties of Pears were nearly in bloom. Beurré de Capiaumont and Williams' Bon Chretien were rather backward. I had hopes that their woolly coats would have saved their blossoms; but I find, a little further on, the following entry:—"April 30: Bon Chretiens and Capiaumonts in full bloom, their flowers are very abundant, but small, the petals crimped or curled; they appear injured. Are they?" Another entry answers this:—"May 14: Nearly all the Pear blossom has dropped off."

1850, *May 3d.*—A sharp hoar frost, thermometer registered 23°, or 9° of frost. April had been dry, sunny, cold, and very favourable to fruit blossom; Pears, Plums, and Cherries were all in full bloom, and nearly all perished; Apples were not in blossom, their buds were just open, but so nicely covered with their downy coat, that it was hoped, and I remembered asserted, they had not received any injury; they blossomed towards the end of May in apparently great vigour and certainly with much beauty; every petal was perfect, and every stamen and pistil appeared to do its office, but after a brisk wind one night, scarcely a germ was left on the trees, and the ground was strewed with the hopes of the orchardist.

I think I never heard it more than once asserted that no fears need be entertained of spring frosts unless the blossom is nearly or quite expanded; the above memoranda seem to contradict this. I have known many disastrous fruit seasons, but never one like that of 1850; I had not enough Pears for even one moderate dessert by the beginning of November; Plums were equally scarce, for only two varieties out of 200 bore any fruit; one, the Early Prolific, a hardy sort, raised here from seed from the Precoce de Tours many years ago, and the other the Prune d'Agen or Date Plum, from the south of France; these both bore an abundant crop, and they have both withstood the frosts equally well this spring; the Prince of Wales, a very hardy Plum, lost all its blossom by the frosts of 1849 and 1850, although the trees bloomed vigorously, but this season there is a good crop on my young trees; it is really very odd to find a tender French Plum, a very old variety, growing alongside (which is the fact) of a hardy English seedling, bearing equally well the rigours of our climate.

1851, *April 26th, 27th, and 28th*, sharp frosts; thermometer registered 25°, or 7° of frost. Louis Bonne Pears, Beurré d'Amanlis, Beurré d'Aremberg, and many other varieties, and all the Plums, were in full bloom; Beurré Capiaumont, the most backward, its blossoms not expanded. The weather was dry, and the blossom did not appear to have received any injury. The petals did not turn brown, and the germs were fresh and green, and not black at the core, as last year. All the Pear bloom, indeed, seemed to be so vigorous and healthy as to defy the effects of the frosts.

*May 14th.*—Again a frost, and this time a heavy hoar frost of 6°. Nearly a thousand fine trees of the Beurré Capiaumont, from 5 to 15 years old, were in full bloom, as were the trees of Marie Louise, which this year blossomed some days later than usual; still they did not appear injured, for their petals for several days held their snowy whiteness, and the germs of the fruit were green and fresh: but in lieu of swelling, they remained stationary, and, after a brisk wind, nearly all fell, leaving very many trees quite bare, and on others but a very thin crop. All the trees of the two sorts last mentioned are fine healthy standards, and half standards, on Pear stocks. To my surprise, many young pyramidal trees, on Quince stocks of three or four years' growth, although on bloom at the same time, have escaped, and are bearing a fair crop; as have also some Pears raised from seed, the blossoms of which seemed injured by the petals turning brown, yet they have set their fruit freely. Of Mr. Knight's Pears, the Althorp Crassane seems the hardiest, the Dunmore has failed. This is the sixth consecutive season in which the Marie Louise Pear has totally failed on standard trees. I remember the late Mr. Wilmot, of Isleworth, telling me I think, in 1849, that he intended to cut down all his trees of this sort, owing to their so repeatedly failing; this is the fifth spring in which we have had these destructive frosts, and I hope it finishes the cycle. I remember some years since, after a series of abundant fruit seasons, saying, that our climate seemed so changed for the better, that I thought it must be fixed, and that destructive spring frosts were matters of history; let us now hope that our cycle of abundance is near at hand. Apples are an abundant crop, and Plums of hardy kinds are also abundant, as are Cherries. I am inclined to think that the cold damp weather had much influence on the Pear blossom, for trees against wooden fences and other sheltered places, well protected with Fir branches, shed nearly or quite all their blossom without setting their fruit.

Tender varieties of Plums, such as Green-gage, Coe's Golden Drop, Imperatrice, Reine Claude de Bavay, and some others, young trees in pots in one of my orchard houses, with a bush hedge for a back wall and a Yew hedge for a front ditto, have set more fruit than they are able to bring to perfection; as have also some Pears in pots on Quince stocks. Some Peaches and Nectarines in a like structure are also full of fruit; while those against walls in this neigbourhood, whether protected or not, have totally failed. The trees are also blighted and in a bad state. The trees under glass, owing, I suppose, to their being kept perfectly dry all winter, are in a fine healthy vigorous state, no curled leaves and no aphis to be seen. To more completely exemplify the effects of our wet mild winters on fruit trees, some Plums which have been with the Peach trees in the same house ever since last summer, and were, like them, kept perfectly dry all the winter, have finely developed foliage and the most vigorous health, while some trees of the same age which were in pots in the open air, the pots protected from the frost with litter, and not removed to the house till the end of February, have had the curl and the aphis, and other ills to which Plums "are heir to." What volumes of evidence this simple fact seems to give, as to the proper treatment of the roots of our fruit trees! for these BULLET, on which have been standing alongside of those which [illegible] wintered under glass, and have had exactly the same treatment; they have set plenty of fruit, but their health apparently suffered from their roots having been exposed to the heavy rains of winter and early spring. Dry roots make ripe shoots. Verily, if our cold springs and mild wet winters continue, we must have "crystal" fruit gardens as well as "crystal palaces." *T. Rivers, Sawbridgeworth, June 18.*

## BRITISH SONG BIRDS.

(Cage Birds, No 21.)*

No. XXXVII.—We have glanced at those ill-starred spots where the nightingale does *not* pay his annual friendly visit; we will mention anon those localities which are regularly blessed with his presence from year to year.

It is quite clear that this bird loves retirement as well as sociability. Safely hidden under the lowly branches of an evergreen, or buried in the recesses of a copse, he feels himself secure from harm; and thus encamped, he sings freely and happily both by day and by night. It is when thus located, that he makes the acquaintance of his tender-hearted hosts, who hail his advent with listening ears and a joyful heart; and in the precincts of their grounds he takes up his abode, seldom wandering beyond prescribed limits. The same bird, as I have elsewhere noted, returns to his former haunt regularly every year—provided he has not been molested, and provided he has not been deprived of his offspring. Such an offence *contra bonos mores* would banish him for ever!

Surrey, Kent, and Middlesex, are the counties most favoured by the Nightingale,—perhaps because they find therein an abundant supply of everything they delight in. Woods, groves, brakes, shrubberies, copses, and thickets, wherein abound all varieties of insect life; these, with gliding streams, running brooks, and flowing springs, make up their little heaven of happiness. They visit, in addition, Berks, Sussex, Essex, Cambridgeshire, Herts, and other neighbouring counties. Hampshire is the god of their idolatry. In the Isle of Wight, for instance, I have seen, even in the first week of April, some scores of Nightingales; and so tame! To look at each little happy rogue as he sat beneath a branch, shivering with song, you would think that—

> "From every feather in his frame
> He poured the notes——."

And yet, he is said to be a "melancholy bird!" This vulgar error must now be exploded. It is unworthy of the year 1851:

> "——Therefore be merry, *Philomel*,
> For thy solicitor shall rather die
> Than give thy cause away."

There can be no doubt that our very changeable climate offers serious cause of offence to this king of birds. Our mornings are chilly, our days in summer (if we have any) are oppressively sultry, and our nights are decidedly cold. What a contrast is presented in France! I had occasion to visit Paris in 1849, just at the season when nightingales *here* were becoming silent. The treat in store for me on my arrival was beyond description great. Not only did these birds frequent the gardens of the Tuileries by day and by night, and every other quarter where green trees could be seen (Versailles in particular was a highly favoured locality for them)—but the inhabitants of the "gay city" had them suspended in appropriate cages in nearly all parts of the town. The Parisians in fact—let me record it to their perpetual praise—seemed nightingale-mad.

Strange, too, was it that these birds, with us so shy, sang abroad, even in the day-time, with the boldest front—causing the very streets to echo to their voice. At night also, when the noise of passing vehicles was all but deafening, *then* did these charmers cause their melodious notes to be heard high above all! My friend, who accompanied me as *compagnon de voyage*, speedily made up his mind that I was a veritable lunatic, and often repaired to his hotel in despair,—leaving me to parade the public thoroughfares, "with ear attent," till long after midnight.

The very delightful climate of France fully accounts for this excellence in the nightingale. The atmosphere is always clear; the inhabitants burn wood fires; and the heavy smoke, so peculiar to England, is there unknown. Every other song bird, I should observe, excelled in like degree, to my great astonishment. Their notes were far more perfect; their song far more joyous; their plumage far more "trim" and showy,—thus making it indisputably clear, that for birds to be healthy and well, their lungs must have free play, and they must live in a pure atmosphere. Indeed I myself experienced an immediate and most salutary benefit from the genial change of climate.

All this may, and indeed does fully account for the nightingale being so particular in absenting himself from certain localities in England. It is beyond all question that their instinct acts as an unerring guide to them in their selection of a place adapted for their constitution, and the well-being of their young families; and we cannot but admire the benignant hand of Nature, so observable in all her works. The time for emigrating

* Our Treatise on the Nightingale is this day completed. I believe it contains every thing that needs to be known connected with that bird. Long acquaintance with his habits, and peculiar opportunities for noticing his disposition and temper, have enabled me to invest his character with an originality that has already won him hosts of new friends and admirers. My remarks in the *Gardeners' Chronicle* week by week, have, I observe, in a disjointed form, been borne on the wings of the Public Press into all lands. The Nightingale deserves such homage; and I feel proud to have been his historian.

is early in September. If that month be unusually fine, and there is little wind, they occasionally tarry till the first week in October. After this, they are no more seen. It is at this season that the "agitation" commences with the caged-birds left behind; of which, as promised, more hereafter.

I would here remark, that several observant correspondents anxiously ask me—if I *never* remember to have heard this bird discoursing music in a "melancholy" strain? I unhesitatingly answer, yes; but it was after the spoliation of her nest of its callow brood, by the ruthless hand of a heartless robber:—

" —— Hark! How the nightingale *laments*
Her ruin'd care,—too delicately framed
To brook the harsh confinement of the cage!
Oft when, returning with her loaded bill,
The astonish'd mother finds a vacant nest,
By the hard hand of unrelenting clowns
Robb'd,—to the ground her vain provision falls!
Her pinions ruffle, and, low drooping, scarce
Can bear the *mourner* to the Poplar shade;
Where, all abandoned to *despair*, she sings
Her *sorrows* through the night; and on the bough
Sole sitting, still, at every dying fall,
Takes up again her *lamentable* strain
Of winding woe; till, wide around, the woods
Sigh to her song, and with her *wail* resound!"

Thus sings our sweet poet—Thomson. Too well do I know; too often, alas! have I verified the truth of his elegant poetic sketch.

Little more now remains to be said. When you feed your branchers and nestlings on German paste, remember always to rub in with it hard-boiled yolk of egg, a little bruised Hemp-seed, and some sponge-cake. Be careful not to use "Sterry's" German paste, but that which is made with honey instead of treacle; the latter being far too gross for their digestion. If ever you have occasion to handle your birds, hold them securely, but avoid all undue pressure; and never keep them longer in your warm hand than is absolutely necessary. Their structure is curiously delicate, and the machinery of their body is very easily destroyed.

One word more. I take it for granted that you wish your nightingales to sing by candle light. To ensure this, let them, from September until the following spring, hang in one particular spot in the room where you sit. When they become used to this, they will feel quite at home and happy. To change their position, would perhaps unsettle them for months to come! So singular are the fancies, and so peculiar are the habits of this truly extraordinary bird.

Some people aver that the song of the nightingale is not the same by day as it is by night. The fact is, it is listened to under distinctly different feelings. There can be no doubt that it is more effective by night, because all nature is in a state of repose, and our minds are under different influences. The strain, however, is virtually the same, and every note is a volume. It is not often that one meets with a kindred spirit in the appreciation of this bird's song. We want a few more Izaak Waltons amongst us. Methinks I see the good old Izaak, rod in hand, setting out at early dawn for the river's brink, Philomel the while enchanting him with his morning hymn:—

"The stars were cut—the sky was full of them,
Dotted with worlds. The land was all asleep."

"Lord!" exclaimed he, raising his eyes aloft in the fulness of his overflowing heart—"WHAT music hast thou provided for the saints in heaven, when thou givest bad men SUCH MUSIC ON EARTH?" *William Kidd, New Road, Hammersmith.*

## FOREIGN GARDEN GLEANINGS.

(PARIS.)

BEING in Paris for a few days at Easter, I was anxious to see any collections of Orchidaceous plants which were accessible; a friend procured for us permission to see the collection of M. Pescatore, at the Château de la Celle St. Cloud, near St. Germains, and which you have more than once noticed in the *Gardeners' Chronicle*. We were very kindly received by the proprietor, who, with Mr. Luddeman, the director, showed us the plants. The collection is very large. In the printed catalogue, the number of species and varieties enumerated is 783; and in the interleaved copy there are nearly 200 more added. As far as I was able to judge, the plants were well grown, and the collection in general appeared very healthy and remarkably free from insects. Perhaps the use of a more fibrous peat (like that which most growers in this country procure from Messrs. Veitch, of Exeter), would be found beneficial; and I think that the plants grown in the collection of Mr. Rucker, Mr. Warner, and Mr. Hanbury have the appearance of being exposed to more air and light than those of M. Pescatore. There were several plants in flower, amongst others a magnificent specimen of Dendrobium fimbriatum (purchased of Mr. Cox), Chysis bractescens, Arpophyllum giganteum or spicatum; Odontoglossum nævium, (the two last obtained from Messrs. Rollisson, and very beautiful), &c. I observed, both in this collection and in those of the Jardin des Plantes and of the gardens of the Luxembourg, many of the plants had seed-pods, the flowers having been artificially impregnated. I did not, however, learn whether the cultivators had been successful in raising plants from seed; I only saw one house, at M. Pescatore's; either there was another, which we did not see, or he stated his intention of building a second house; but as we had arrived late and hungry, and had to return to Paris to dinner, we had only time for a very cursory inspection of this vast collection.

In addition to almost every plant which is to be found in the English catalogues, there are many in the list which are not grown in this country, several being imported from the Isle of Bourbon and other French settlements, or obtained from the foreign collectors. Of the two collections at the Jardin des Plantes and at the Luxembourg, the first appeared to be cultivated with most care, but the collection at the latter garden was the largest; though it does not appear that much attention is bestowed on their cultivation. At the Jardin des Plantes there was one marked Centrosia rosea coming into flower, said to be handsome, and several others, the names of which I do not find in the ordinary catalogues of the English nurserymen. *Dodman.*

## ORCHIDS FOR THE MILLION.

By B. S. WILLIAMS. gr. to C. B. WARNER, Esq., Hoddesdon.

(*This will be continued in our next Number.*)

## Home Correspondence.

*Cheltenham Horticultural Show.*—On perusing your Paper of the 5th instant, I see a letter from Mr. William Davidson, one of the judges at the Cheltenham Horticultural Show, held on the 11th June last. Though perfectly right in the main, yet, from being a stranger to the place, he has fallen into one or two errors, which, with your permission, I will try to rectify. The article he refers to, in the "Cottage Gardener," cannot apply to any shows held under the management of the Cheltenham Horticultural Society, as has, I think, been clearly shown in a letter to that journal of July 3d; but as there appears to be a great deal of confusion and misunderstanding relative to the Cheltenham shows, I will, if possible, put them in their true light. The Cheltenham Horticultural Society has been established for many years, and held its five or six meetings annually, which were mostly of a local character, and seldom heard of beyond the county. Last year, however, some of the leading inhabitants of the town formed a committee, and raised a subscription, as a means to revive the amusements and attraction of Cheltenham as a watering-place, &c., and one way in which they disposed of part of the money so collected was, in giving 200*l.* in prizes for a Grand Monster Show or Horticultural Fête, to be held at the Old Wells, on the 20th of June in that year. This fête took place, and proved highly successful, and the lessees of the Spa (encouraged by their former profits) *this* year advertised a similar one, which they held on their own account as a private speculation, and which took place on the 19th of June last. *The Committee of the Horticultural Society had nothing to do with either of the fêtes*, though attempts were made to unite them, but from circumstances that I need not enter into without success. Some of the members of the Society, seeing that if good prizes were offered, that a far superior exhibition might in future be calculated upon, took the matter in hand, and made considerable alterations in the rules of the Society, reducing the number of shows to three instead of five or six, and removing many of the restrictions that existed under the old rules, and by great exertion considerably increased—nearly doubled—the number of their subscribers, by which means they were enabled to advertise a schedule amounting to about 150*l.* for the three shows. The first, held under the new management on the 8th of May, proved eminently successful, and gave *great satisfaction*. Upwards of 90*l.* was taken by the sale of tickets for *that* day only (nearly four times the amount ever taken before), and the collection of Orchids, stove, and greenhouse plants was most satisfactory. The second fête took place on the 12th of June, but owing to the proprietors of the Old Wells having arranged to have their fête on the 19th inst, *seven days* afterwards, and offering 200*l.* in prizes, many of the usual competitors of the Horticultural Shows *held back their best plants, or did not send them at all*, in hopes of gaining the larger amount of money the week following. *Hence*, the reason why Mr. Davidson remarks, "in fact, taking them altogether, I never saw a more indifferent lot at any provincial exhibition, &c." The committee of the Society have *but one* object in view, and that is to raise the Society to the highest point, and to make their shows (as stated in the letter above referred to in the "Cottage Gardener") to be "the first and most attractive out of London." The strictures in that journal evidently refer to the show held at the Old Well, in June, 1850. The above is a simple statement of facts, and I defy contradiction; and if you will favour me with a space in your journal for the above somewhat long (but unavoidably so) letter, I shall feel obliged. P.S. Mr. Davidson has fallen into an unintentional error, when he supposes that the Society pays carriage of the specimens; they wish, and, I think, do act with every liberality, but the want of means prevent them from doing the above. *Verax.*

*Fleming's Tar Paint.*—Having a quantity of iron fencing, hurdles, &c., which require dressing with some composition to prevent corrosion, and likewise to give them a decent appearance, I was disposed previous to the correspondence of "L. L.," to adopt Mr. Fleming's system of tarring, which is evidently advantageous both for present and future economy when applied as Mr. F. advises. But as the system has failed with "L. L." from some unknown cause, the idea suggests itself that it may also fail with me and others, except we can benefit by his failure and take precautionary measures. The evidence of other parties is now solicited to confirm its merits—or *vice versa*; and if "L. L." would oblige by stating precisely the plan he followed, it would assist materially in arriving at a fair conclusion, as to the cause of failure, &c. I will offer the following questions for his consideration; which, I believe, embrace the more important details to be observed for securing success in using the "tar." Was the iron rusty when tarred? perfectly dry? the weather warm? and the tar boiling hot? and were the proportions used those which Mr. F. recommends, viz., two-thirds gas, and one-third Stockholm-tar? Every one must duly appreciate Mr. Fleming's zeal to economise labour, and more especially those who have almost endless iron fences, gravel-walks, and extensive gardens to manage. *W. C. E., Gloucester.*

*Forcing Peaches.*—In a letter we have received, "J. M.," of Earleston Gardens, near Birmingham, offers the following statements for the consideration of "Curiosus," who criticised an article written on this subject by "J. M." some time ago. The latter is of opinion that many of the golden rules handed down to us by our forefathers cannot yet be well dispensed with, although some of their practices have been much improved upon by modern gardeners. "J. M." asks "Curiosus," what the consequence would be of giving water in moderate or immoderate quantities to the vegetable kingdom, say at any time, and he further enquires if the latter, by way of experiment, never started his early Peach-house at a given temperature, maintaining the same for nearly three weeks until three-fourths of the buds had dropped off, and then reduced the heat 10° in order to save what remained of a crop. He considers that these inquiries form the best answer to "Curiosus'" remarks.

*Our London Gardens.*—I have sent you a specimen of the black grub which infests the garden in Oxford-square. I observed it last year; and during the present season it has prevailed to such an extent, that many quart measures have been gathered. It lives just below the surface, and eats into the stems of plants near the roots. Almost every Pink, Carnation, Sweet-william, White-rocket, and Thrift (Sea Pink), has been destroyed, and I believe a great portion of the annuals. The gardener has been incessantly employed in collecting the grubs. Can you tell me what it is? and what is the most likely mode of extirpation In another pot, I send some lumps of rape-cake, which I placed round Pinks and Carnations; in consequence of seeing the article on the destruction of wire-worm, in the last Number of the Royal Agricultural Journal, by J. M. H. Charnock. The lumps, within a week of being placed in the ground, appear to become a nidus for the worm; but I fear they only give facilities for its increase. I have not perceived that any of the worms show symptoms of disease or death; on the contrary each lump swarms with them and their young. *J. W.* [The black grubs which infest the squares of London at this season, in such great numbers as to be a perfect pest, are the full-grown larvæ of the common daddy long-legs, Tipula oleracea. As they feed upon the roots of growing vegetables only, they are not attracted by the Rape-cake, the small insects in which are not the young of the black grubs (which are not able to reproduce their kind until they have arrived at the winged state), but are the larvæ of various small two-winged flies and beetles. We know no better plan of extirpating these insects than employing children to catch and kill them *in the winged state*. *W.*]

*New Mode of Glazing.*—Near the boiler-house, at the Great Exhibition, is a greenhouse, contributed by Mr. A. Kent, of Chichester, showing a contrivance by which the glass is fixed by India rubber and screws, instead of putty. The advantage of this invention consists in the facility it affords for painting and repairs, by the easy removal of the glass, which renders this kind of glazing useful for any plant or other structure requiring full or partial exposure during the summer months. The house in question is worthy inspection by those interested in horticultural buildings. *A Subscriber.*

*Seeds* (see p. 310).—I observe that one of your correspondents has complained of having to pay 2*d.* per paper for various seeds which he had bought at a shop in or near Exeter, and that the man assured him that they rarely made up such cheap packets. I should think not, indeed. But your correspondent took the seed home, and spent his valuable time weighing the quantity, &c., and implied that he had got a very scanty allowance for his paltry 2*d.* What would he have? a tradesman's time and paper and string and trouble and seed, with a character for genuineness to depend upon—all for nothing? Does he consider what the produce of that seed is, and how large a patch of beautiful flowers he gets for his money? Does he know that some seeds are worth many guineas an ounce. I regret that your quick eyesight allowed such a letter to pass without comment. The value of seed of all sorts should never be considered if you can have it pure and genuine, as the increased value of the produce upon the original outlay is so enormous—and of course the risk equally in proportion. What with roguery and unfair competition and the cheap mania, the seed trade is bad enough, without such worthless complaints as those of your correspondent. *Northwood.*

*Kitchen Gardening.*—The following are my ideas of a kitchen garden as applicable to myself, and probably not inapplicable to others. My kitchen garden is an old exhausted one, surrounded by timber, not desirable to dispense with, nor now economical in cultivation. Admitting that it is expedient to form a new one, although it may not altogether suit the pocket, I castle-build to make a new one, and I lay down certain premises for the formation of my structure. In these days of easy communication, bought articles are often the cheapest, therefore too large a garden is expensive; but many articles are not so well in perfection when purchased for the table as those grown on the premises. I will

divide all my fruit and vegetables into two: permanent and transitory. I shall have two gardens, the one permanent for the walls and early cultivation, the other moveable. My walled garden costs much money. I will have it as small as possible, to provide sufficient surface of wall; after that expenditure, why sacrifice my walls to cheap vegetables better grown elsewhere. I shall therefore grow nothing on my walled borders, but allow the fruit tree roots to ascend to the surface for the benefit of the sun. Asparagus, for instance, belonging to the permanent class, will take the open space in the centre with other crops of similar nature; and for early purposes I would have small interior walls from 3 to 4 feet high. The great bulk of my vegetables will be in my shifting garden, for which I shall enclose a space in the fields, secure from vermin, &c., as cheaply as possible; this I shall trench and cultivate for some years for sweeter vegetables, and, when desirable, I shall move off again to adjoining land, or elsewhere, marching over the land, subtrenching and improving the soil, and by inoculation from each shift, I shall lay it down at once again. *C. P., York.*

*The Crystal Palace.*—The great question of the day, whether the Glass Palace, in Hyde-park, should be perpetuated as a monument of British skill and enterprise, and at the same time made subservient to other important objects; or whether, when its present purpose is fulfilled, it should be removed, lest it should be desecrated by being converted to any less noble use, appears not to have met with an unanimous response. And as this is a question which should be settled by popular suffrage, and upon which the people must speak, if they would have their rulers act, the matter is fairly open to discussion. It may surely be assumed that a winter garden, accessible to the resident and visiting population of the metropolis, would be an incalculable advantage. To deny this would be to deny the importance of any sanitary schemes. In a climate like that of England, especially, where, for two-thirds of the year, an invalid hardly dare breathe the free air, shelter, such as this building affords, and an atmospheric volume such as it contains, of so great magnitude as to be beyond the possibility of contamination from ordinary sources, would be a boon beyond description. But besides aëration for the valetudinarian, there would be exercise for both the sedentary and unoccupied; and there might also be instruction for those who sought it, and sensible amusement for all. Indeed, the advantages of retaining such a building, for such purposes, are so obvious and manifold, that one feels surprise that any other view of the matter should be seriously advocated. I do not, therefore, agree in the opinions elsewhere expressed, that the building should be taken down because no adequate reason has been assigned. I may be short-sighted, but I do not see how, for instance, it could in any way tend to increase or even secure the lustre of Mr. Paxton's fame, to pull down that noble structure, within a few months of its erection, as if it could not be trusted to stand any longer where it is! Besides, why should such an opportunity of providing the means of health, exercise, instruction, and pleasure, for the "people" be lost? The rich folk of London—or at least a portion of them, have their winter garden in the Regent's Park, a luxury which they fail not, many of them, to enjoy. But, why should not those classes too, who would not be admitted there, why should not these have access to a winter garden—a promenade for their healthful exercise, a garden-scene for their gratification, and thus at all times within their reach? That expenses must be incurred, and these of some magnitude, in order to keep such a building in proper repair, and in proper keeping, is a matter of course; but as it has been shown that the proposed winter garden scheme might be made self-supporting, there need be no anxiety on this head. The Government, if need be might even do worse than take the responsibility of repairs upon themselves; and as to the keeping, as the means will be forthcoming, so it cannot be doubted will be the man. Whether the building stands just where it ought to stand as a permanent structure, is another question. I with many others, think it does not. Placed at it is—to use an Erinism—"It's so big you can't see it." But this could hardly be taken to justify pulling it down, merely for the sake of putting it up again in a more appropriate situation. These are questions upon which probably the public must express its opinion, before anything can or ought to be done; and the way to do this is of course by public meeting and petition, or address to Parliament, one or both. My chief object is, to suggest that the horticulturists of Great Britain, as a body, should in this matter make their petition, that the Glass Palace be retained, and converted into a public winter garden. The management of such a petition could not be in better hands than those of the Editor of the *Gardeners' Chronicle*, and the occasion of the approaching horticultural *fête*, would afford many residents in the country, interested in this national undertaking, an opportunity of affixing their signatures. *Thos. Moore, Chelsea.*

*Song Birds* (*see p.* 422).—I wish to say a few words more in regard to the stone-chat. I think any person would conclude that a bird designated as a "tender summer warbler" was a migratory species, and I merely wished to state that the stone-chat was a resident here throughout the year; it is one of our earliest breeders, and I have frequently known the young birds to leave the nest by the middle of April: it is possible that it may be migratory in Germany, although stationary here. The whin-chat, which used to be one of our most abundant summer visitors, has nearly deserted this neighbourhood, and for the last three years I have not seen more than one or two pairs. It would be very easy to have a specimen of the bird found in Wales sent by post, and this would settle the question beyond all doubt. *Henry Doubleday, Epping.*—— There is no doubt in my mind that Mr. Doubleday is correct in saying that the strange bird seen in Wales is the male redstart (or some undescribed bird), or the pied fly-catcher, although that has no red about it; this last is an exceedingly local bird. I never saw it but in one place (in the woods adjoining Gisburn Park, the seat of Lord Ribblesdale); but when angling there some years ago, I saw at least half-a-dozen pairs between Pugthorn-bridge and Gisburn corn-mill; how it happens to be so plentiful there, whilst seven miles off, in localities that are very similar, one is never seen, it may be somewhat difficult to account for. Mr. Kidd promises some papers about the black-cap; will he be kind enough to point out the differences (if any) between the nest, eggs, song, and fretting notes (notes of distress uttered by the bird when anyone goes near the nest) of the black-cap and those of the garden warbler (Sylvia hortensis)? I must confess they puzzle me. The birds are quite distinct in appearance, but until I see the bird I cannot tell from its note, its nest, or its eggs whether it is a black-cap or a garden warbler. This latter has a most extraordinary liking for Kentish Cherries, and until my boys declared war against them (not war to the knife, but the rifle ball), we could never secure a ripe one. They seldom came into the garden until the Cherries were nearly ripe, and they entirely disappeared when the crop was eaten. *E. G.*—— I beg to inform Mr. Kidd, that the stone-chat remains here throughout the year; whereas the whin-chat leaves these parts in the autumn, and does not return to them until about the middle of April. Mr. Kidd will find an interesting, and as far as my experience goes, accurate mention of both birds in Yarrell's "History of British Birds," *John Boswell, Iver, Bucks.*

*Cure for Mildew on Grapes.*—I was sent for one day to inspect a beautiful house of Grapes. The Vinery contained 10 Vines of different sorts. I remarked that mildew had spread all over the house, and was beginning to settle on the wood. I ordered a fire to be lighted about 3 o'clock in the afternoon, the house to be well slushed with water, and the Vines to be syringed all over, in order to make everything damp. When the house was heated to 75°, I had water poured on the pipes, and the latter dusted with black sulphur. I then had the heat raised to 90°, and in the morning I observed black spots through the leaves, instead of white spots of mildew on the top of the foliage. The quantity of sulphur used was 1 lb. at two dressings, for the same treatment was repeated the next night; and now the Grapes are swelling and going on favourably, with no signs of mildew except the spots where it was. I have sent you some leaves for inspection. *W. Sowden, gardener to D. Rutter, Esq., Hillingdon.*

*Watering a Flower Garden* during continued sultry weather has been condemned as doing more harm than good; and so it will, if the usual sprinkling from a rose is all the plants are to have, which only hardens the surface of the soil; but if the earth is loosened with a fork, and well saturated in the cool of the evening, the nozzle being removed from the pot, the blossom and foliage will soon speak for themselves, and reward the amateur, who must have the beds soaked under his inspection, not merely damping the earth, an injurious practice. In these days of invention, no man having a brook within half a mile of his garden, should be without plenty of water. *Falcon.*

*Parrots.*—If the following statement of the case of a parrot, which, from some irritation, picks out all its feathers, should elicit a reply, and suggest a remedy, it will greatly oblige an individual, and be useful to many, as the instance is not a singular one. It is an African grey parrot, about 12 years old, and was formerly very healthy. About four years ago, it began to bite the feathers off the shoulders of the wings, which it continued to do for the last 3½ years; the last six months it has bitten off all its feathers except the quills of the wings and tail, and has stripped the down off the wing quills. It often appears to be vomiting, with a kind of tremour and drowsiness. The following remedies have been tried. Washing with cold water, with liver of sulphur and water, with tan water, with a kind of lime-water that parchment is dipped in, and with tobacco-water; these have each been tried in succession, allowing ample time for proving the failure of all. As medicines I have used (also in succession), and with great patience and caution:—Magnesia, milk of sulphur, nitre, saffron, chillies, capsicum, and grains of paradise; these being mixed with bread and water. It has been bountifully fed with bread and milk, bread and water, biscuits, cakes, nuts, hemp and canary seed, fruit and vegetables, sometimes chicken bones, and rich puddings. For the last six months its diet has been changed to sopped bread and Indian corn, boiled and raw. Since it has been dipped in tobacco-water, its skin has become clean and bright; it allows its feathers to grow for a time, and then picks them off; it appears always to have an itching sensation. It drinks very little, it is kept in a brass cage, and carefully attended to in every respect. *G. R., Guildford, Surrey.*

*Decay in Larch.*—Having planted, and paid much attention to the growth of Larch, in Devonshire, I have been surprised to find the same symptoms of decay mentioned in your paper a short time ago, after a growth of 30 years, and some younger, both in damp and dry situations. One beautiful plantation in particular, planted on a dry, slaty bank, at Lifton Park, near Launceston, and which has made great growth, though quite healthy in appearance, shows unmistakeable signs of decay, when cut down. *An Old Subscriber.*

*Gooseberry and Currant Trees Disbudded by Birds.*—I have many Gooseberry and Currant trees in my garden, and for several years successively I found that numbers of the branches possessed blank pieces of a foot in length without an eye or leaf, and it occurred to me that it was occasioned by birds destroying the eyes in winter. As a preventive I adopted the plan of loosely festooning thick darning cotton from branch to branch on the outside of each of the trees as soon as I had pruned them, and it had the desired effect; so much so, that for four years during which I practised it, there has scarcely been a missing eye on any of the branches. A curious circumstance, however, has attended the plan, viz., in a number of instances where the attachment of the cotton has taken place, the branches have died, and, in some cases where the trees were old, one half has been killed. This has been the case every year up to the present. It occurred to me that the cotton was a conductor of the electric fluid, and that that might have been the cause of the evil. To prevent for the future the loss of my trees, and at the same time to save my fruit, I think of placing three or four hazel sticks round each tree, and attaching the cotton to those instead of the trees. *J. W., Walthamstow.*

*Royal Botanic Society.*—In your report of the fruit at the last exhibition, you have committed an error. In the award of the 1st class prize for Strawberries, you say that "Mr. Kitley was first;" but it should have been Mr. Lydiard, for Kitley's Seedling Goliath. Mr. Kitley did not exhibit at all in either class of fruit. *Peter Lydiard, Batheaston, Bath.* [We take this opportunity of remarking, that great difficulty exists in obtaining correct information regarding the prizes for fruit. We suspect that the "award board" was never suspended in the garden at all; or, if it was, it must have been as late as 6 o'clock in the evening! Under such circumstances, can it be wondered at that errors are committed?]

## Societies.

NATIONAL FLORICULTURAL, *July* 10.—E. FOSTER, Esq., in the chair. Various Pelargoniums, Petunias, Fuchsias, Verbenas, Calceolarias, Carnations, Picotees, and Pinks, were exhibited on this occasion, together with a double Cineraria (?), resembling Senecio elegans, and one or two other plants. Mr. Turner, of the Royal Nursery, Slough, received a certificate for Dodwell's Mary Picotee, a pleasing variety, but wanting in purity; Fellowes' Prince Arthur, though rather rough, was commended. The same grower was also awarded a certificate for Fuchsia, "Banks' Diamond," a dark variety, much reflexed, but a little loose in habit. Messrs. Henderson's Carnation-striped variety of Drummond's Phlox was commended for its colour and suitability as a bedding plant. A first-class certificate was awarded to J. Edwards, Esq., of Holloway, for a Primrose-coloured Antirrhinum, which, on account of its size and shape, is certainly an acquisition to this somewhat neglected class of plants. Mr. Edwards's Pink Titus appears to be a first-rate flower; but only a single bloom was shown. Of Mr. Major's Calceolarias, Nos. 9 and 11 were the best; none of them were, however, considered worthy of reward. Certificates were given to Mr. Smith, of Hornsey, for Verbenas "Purple Rival" and "National," both desirable kinds. Mr. Ambrose had a Fancy Geranium, named "Fireball," which was commended. Some good Gladioli were furnished by Mr. Stains, and Gloxinias Princess Alice and Victoria by Mr. Parmenter, of Kentish Town. [We would here remark that the Society should insist upon plants being produced on all occasions, and refuse all notice of mere blooms. ED.]

BOTANICAL, OF EDINBURGH, *June* 19.—Professor BALFOUR in the chair. The following papers were read:—1. On the Government Teak Plantations of Mysore and Malabar. By Dr. Cleghorn.—2. On Chantransia, Desv. By J. Ralfs.—3. Notice of Belenia prælta of Jacquement. By Dr. Balfour. Dr. B. stated that the plant exhibited by him at last meeting, as a species of Hyoscyamus, turns out to be the Belenia prælta of Jacquemont. The genus Belenia differs from Hyoscyamus in its corymbose inflorescence and more regular flowers. The plant is described and figured in Jacquemont's work. It grows on the Himalayas at great elevations, and towards the northern slope, abounding in the flat plains on the lofty summits. The plant in the Botanic Garden was raised from seeds sent by Major Madden, to Mr. Moore, of Glasnevin.—4. Remarks on some Australian products. By S. Mossman. Dr. Balfour made some remarks on the glandular stipules of Cinchonaceæ. Mr. Weddell states that on the inner surface of the base of the stipules of Cinchona and allied genera, he had observed numerous small glands which secreted a gummy fluid. In Cinchonas the secretion is transparent and fluid, while in several other genera it is solid and opaque, and seems to glue the stipules to the bud which they embrace; this is particularly the case in Pimentelia glomerata. In Rondeletia the secretion is soft, like wax, and of a beautiful green colour. The inhabitants of Peru give it the name of Aceite-Maria, or Oil of Mary; they collect it carefully, and use it as an external application in various diseases. The stipular glands have an oval or lanceolate form, and are somewhat pointed. The axis of the gland is in the form of an elongated cone; it is composed of

elongated and dense cellular tissue. Dr. Balfour, with the aid of his pupil, Mr. Matthews, examined these glands in many Cinchonaceæ, and they detected them in fresh specimens of the following:—Cinchona Calisaya, Burchellia capensis, Cephaelis Ipecacuanha, Coffea arabica, Ixora javanica, Mussænda frondosa, Rondoletia speciosa, Pavetta indica, Luculia gratissima and Pinceana, Pentas carnea, Gardenia Stanleyana, and other species. In some the secretion was beautifully coloured. Specimens were shown under the microscopes, as well as magnified drawings of the glands. Dr. Balfour stated that he had recently received a letter from Dr. Walker Arnott, in which he remarks, that in preparing spiral vessels, to show them fresh, he finds the most easy plan is to take the petiole or peduncle of Pinguicula vulgaris and squeeze it between two glass slides, so that it may become thin and transparent. In this way a preparation is made, which, when put under the microscope, exhibits spiral vessels and annular ducts distinctly, without any farther trouble. Dr. Balfour exhibited specimens of Knappia agrostidea, recently collected by Mr. Syme at Gullane Links, but which he had subsequently ascertained to have been sown there by several botanists at different times; as also, Ranunculus confusus, Gr. et G. from a pond at the same place; and R. trichophyllus, from the pools at Gullane: the latter is considered by Mr. Babington and others as a variety of R. aquatilis. Many interesting plants were exhibited from the Botanic Garden, among which were Solanum fragrans, a well-flowered specimen of Dendrobium densiflorum, a set of Robertsonian Saxifrages, Alpine plants, rare Carices, &c. A collection of Alpine plants was likewise exhibited, from the garden of Dr. Neill, Canonmills-cottage, including Stellaria scapigera, Oxyria reniformis, and others of interest. Mr. Stark exhibited Stylidium androsaceum, Orchis muscifera, Aceras anthropophora, and other plants in flower; also, a fresh specimen of Trichomanes radicans in a state of fructification. Three new Fellows were elected.

Entomological, *July 7.*—J. O. Westwood, Esq., President, in the chair. Donations from the Linnean Society of London, Dr. Asa Fitch, of the United States, and other naturalists to the library and collections were announced. Mr. E. Shepherd exhibited a box of British Lepidoptera from Burwell fen and Darenth wood, including many rare and a few new British species of Micro-lepidoptera; also a beautiful specimen of the very rare Stauropus Fagi, from Black Park, Bucks. Mr. F. Smith exhibited a specimen of the fine new British Gastropacha ilicifolia, captured in Cannock-chase, near Rugeley, in May last, by the Rev. W. S. Atkinson; also living specimens of the splendid Chrysomela cerealis, sent by Mr. Foxcroft, from Snowdon. Mr. Douglas brought an exotic species of Blatta and another of Pentatoma, which had been found (together with the larva of Stene ferruginea, one of the Tenebrionidæ) in Kousso, a new and high priced drug, from Abyssinia, used as a vermifuge. He also exhibited illustrations of the habits and transformations of Pædisca bilunana, Ditula angustiorana, Cochylis francillonana, and other micro-lepidoptera.—Mr. Weir exhibited various interesting moths from Suffolk, and Mr. A. Shepherd, specimens of Depressaria assimilella reared from Broom. Mr. S. Stevens announced the capture of Acalyptus carpini and Meginus collaris, two species of Curculionidæ, new to this country.—Mr. W. W. Saunders read a notice of some inquiries he had recently made as to the variation in the weights of different specimens of both sexes of the common cockchaffer. The President observed, that as this insect had been extensively used in Hungary in the manufacture of grease for cart-wheels, the observations of Mr. Saunders possessed a practical value in addition to their physiological interest. The President also gave an account of Dr. Asa Fitch's observations on insects of different species found upon snow in North America. It was announced that the annual excursion of the members was fixed for the 12th instant, at Weybridge.

Botanical, of London, *July 4.*—Mr. G. E. Dennes, in the chair. The Curator (Mr. Syme) exhibited one of the various forms or sub-species usually grouped under the name of Ranunculus aquatilis, which had been collected by that gentleman, at Guillow Links, Haddingtonshire, early in June. He, and others, had referred this form either to R. Baudotii (Batrachium marinum, of Fries), or to R. confusus, of Grenier, and Godron's "Flore de France," two very nearly allied plants, and neither of them easily distinguished from some varieties still usually joined with the typical R. aquatilis.

## Reviews.

*The Naturalist; A Popular Monthly Magazine, Illustrative of the Animal, Vegetable, and Mineral Kingdoms.* Conducted by Beverley R. Morris, Esq., A.B., M.D., T.C.D., Mem. Wern. Club. London: Groombridge and Sons.

Of this very interesting and well-conducted monthly periodical, five numbers only have appeared,—these are amply sufficient, however, to enable us to form a correct judgment as to the value of such a work. The editor appears every way qualified for the conduct of a publication of the kind; and his modestly-urged appeals for support in his undertaking have been largely and readily responded to. We observe among his contributors and correspondents, the names of some very estimable individuals, whose united co-operations cannot fail, we would hope, to render the speculation a successful one. The information sought for and supplied, is that of "a popular character";—all dry, scientific details, being avowedly and very properly excluded, so far as is practicable. One feature in particular is worthy of especial notice. All contributors are requested to append to the articles sent in, their names and addresses. These, if not in every instance published to the world, are in the possession of the editor. This is the direct way of obtaining accurate intelligence, which is of the last importance in journals of this character. The topics introduced are varied and extensive,—all, however, having reference to the legitimate objects of the magazine.

Let us, however, hint to amateur observers that one single "fact" is worth a hundred surmises. We have often regretted to observe how, at this season in particular, remarkable anecdotes get into the papers, of "singular attachments" between animals of the most opposite dispositions. A few weeks since, there was recorded, with much elaborate detail, "a remarkable fact" connected with the domestication of a canary and a mouse.

Every morning, it was gravely stated, the latter was found in the cage of the former; and on one particular occasion, the cage-door was observed to be open, and the bird gone. After a careful search, the "little truant" (*sic in orig.*) was found behind the window curtain—"asleep," by the side of the mouse! This most ridiculous invention, which we have materially abridged, was carefully and literally copied into all the prints. We need hardly remark that science is greatly injured by such oft-recurring fabrications. They answer no good end, and cast stumbling-blocks in the way of youthful inquirers into the secrets of Nature. We hope now that the time has arrived for "prodigious Gooseberries," "enormous circumferential Cabbages," and other such "annual" summer monstrosities—that we shall, for a season at least, be released from such absurd outrages upon Nature and common sense.

Whilst offering a friendly tribute of welcome to our new contemporary, we would just observe that, among the Notes on "Spring Arrivals," in No. 5, are some very interesting particulars of the cuckoo. In the earlier numbers, too, the *affection* of that bird (to some a matter of doubt) is confirmed. It *does* "assist" in feeding its offspring. There are also scattered throughout the work, *inter alia*, some curious particulars of the kingfisher—all very delightful to the lover of Nature.

## Garden Memoranda.

Messrs. Weeks and Co.'s Nursery, King's Road, Chelsea.—The Royal Water Lily has been fully exposed here in an open pond, night and day for the last three weeks, and it is growing and flowering most satisfactorily, the total number of blossoms it has produced being 16. The leaves are 4 feet across, and perfectly healthy; but as yet they have exhibited little inclination to form rims; their whole surface prefers laying quite flat upon the water. A new leaf developes itself about every fourth day, and a flower every third day; the appearance of the plant would indicate a likelihood of its blooming for some considerable time yet to come. The water in the basin is kept at between 80° and 90°, and the boiler from which this heat is derived also warms five houses and two pits of moderate size. About two dozen gold fish were introduced into the pond some short time ago, and they have since multiplied so abundantly that the water literally swarms with their young, which all present the fine colour of their parents. Indeed so well do they succeed and breed in the warm water, that Mr. Weeks is of opinion they will ultimately almost pay the cost of heating it. We need hardly mention that this experiment points out another purpose to which waste steam might be employed both profitably and for pleasure. It is the Thames water in which the plant is growing at Chelsea, and we understand that it is the intention at present to widen the pond next year, and plant in it the various other kinds of tender Water Lilies. It may be worth notice, that the overflowings of this tank are collected into a cistern, from which tepid water can at all times be had for the purpose of watering plants with.

Messrs. Lane's Nursery, Great Berkhampstead, Herts.—The beautiful collection of Roses which this nursery contains is now in full bloom, and, therefore, all who wish to examine them in perfection should see them as early as possible. Conspicuous in the beds on Grass, behind Mr. Lane's house, were the glorious Géant, des Battailles, Souvenir de la Malmaison, the glowing crimson Fabvier, the profuse blooming Miss Glegg, Belle de Florence, and Mrs. Bosanquet; and near these were the climbers Thoresbyana, Ruga, Amadis, and Banksiæflora, concealing the poles which supported them with thousands of flowers and flower buds. Farther up the hill were large beds of all the finer kinds of Hybrid Perpetuals and Bourbons, specimens of each of which are planted here for show. Mr. Lane has been budding largely on the Manetti stock, by way of experiment, in order to prove its suitability for different kinds of Roses, and the result cannot fail to be highly instructive; but at present it would be unfair to offer any opinion on the subject, inasmuch as the experiment has not yet been sufficiently tested. In another part of the grounds, we observed a plantation of three acres of stocks—all Dog Roses, in admirable condition, the stems being straight and clean. Budding has already commenced, and will occupy a large share of attention for some time to come; 13 men are stated to be employed at this kind of work throughout the season. Some weeping or fountain Roses, as they are sometimes called, were exceedingly handsome, by the side of a Grass-walk. This description of Rose is not so much cultivated as it should be, for we are sure that their judicious introduction into many kinds of garden scenery would improve it. We also remarked several sorts of Cytisus "worked" standard high, whose close heads of yellow flowers strikingly contrasted with the many coloured Roses with which they were associated. The common Broom itself treated in this way has an excellent appearance. The usual nursery stock, which is not lost sight of here, is everywhere intermixed with fine plantations of Roses; but to see the latter under the most advantageous circumstances, the Hill Nursery, on Berkhampstead Common, must be visited. Here the queen of flowers is to be found in all her glory. Large beds of Géant des Battailles, Baronne Prevost, Moss Rose Lanei, and other leading flowers everywhere meet the view, all in the most admirable condition—clean and free from blight. The soil here, a hazelly loam, though not rich, seems to suit the Rose perfectly. Among newer varieties were Paul Ricaut, certainly a very fine Rose, beautiful in shape, and occasionally as brilliant in colour as Géant des Battailles; Baron Hallez, crimson, large and fine; Caroline de Sausal, a neat shaded rose; Chereaux, rose, large and double; General Cavaignac, a very fine rosy pink; Géne de Chateaubriand, reported to be a good Rose, but it has not proved so here; Lady Frances Waldegrave, said to be an improvement on Madame Laffay, but in reality very different from that variety; Madame de Lamoricière, pink; Reine Mathilde, large light pink, and good when young, but soon gets out of shape; and Standard of Marengo. The latter is a charming flower, which must certainly become a favourite. Fortune's five-coloured proves to be distinct and rather pretty. The colour is creamy white striped with carmine.

## Miscellaneous.

*Gathering Fruit.*—The chief merit of the gardener, in this respect [the management of ripe fruit], is the supplying of the table with them in the utmost perfection; and the art of gathering, which is very little understood or thought of, is a very essential and material article. I have seen one common custom among gardeners, which is, to go out for fruit an hour before it is to be served at table; and this they think very meritorious, because it will be fresh. I have seen also a contrary practice, which I shall explain, together with its reasons; but first, in order to show its real use, this fact must be inserted. Two gentlemen, relations and neighbours, who had the same soil, and the same kind of trees, and those, to all appearance, managed in the very same manner, found a vast difference always in the fruit; it was so great, that their company never failed to perceive it as well as themselves; and when it came at last to be explained, the whole cause was, that the gardener of him whose fruit was worst, gathered it just before it was wanted, and the other much earlier. This seems to contradict reason, freshness being esteemed the great article in the nicety of fruit; but it is only a seeming contradiction. Let any one examine the state of plants in general in summer, and he will find it this; as the great heat of the day comes on, their leaves begin to flag, and they droop more and more till the cool of the evening. The reason is, the great evaporation of their juices by the sun's heat: they grow flaccid from toward noon till near sunset, then the heat is over, and the dews refresh them: they continue recruiting and recovering during the whole night, and they are firm and lively in the morning. The case is the same in fruits, only it is not so easily perceived. At noon they are exhausted and flattened, and they are heated to the heart: all this renders them dead, and unpleasing. They begin to recruit towards the evening, as the leaves; and in the same manner are in the full perfection at early morning. One hour after sun-rise is the time for gathering them: this was the secret of the successful gardener, and this every one should practise. Let him take some fruit-baskets of open work, cover them with large leaves, and at seven in the morning go out to gather his fruit. When he has carefully chosen what is ripe, and laid it handsomely in the basket, let it be placed in a cool, but not damp room, till it is wanted. *Old Magazine.*

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

Any more of the Indian Azaleas which have completed their growth, and formed their flower-buds, may now have a slight shift, if becoming root-bound, according to the advice given some time back. They should be kept cool, so as to avoid a second growth. This treatment will be equally appropriate for any hard-wooded plants in a similar state of maturity. Although water may for some time yet be liberally supplied to plants in general, it is necessary to make many exceptions to the rule, and these will every day become more numerous. Many plants which have matured their growth require a less abundant supply; and to those with bulbous or tuberous roots, which are now ripening their growth, the supply of water must be more restricted. Plants in flower of Thunbergias, Achimenes, Gloxinias, Geraniums, Fuchsias, &c., the beauty of which it is desirable to preserve as long as possible, should be assisted with occasional waterings of liquid manure; and that the foliage, as well as flowers, may retain their healthy appearance, let the pots, if possible, be plunged,

or shaded by surrounding plants, to protect them from the scorching heat of the sun. Pelargoniums of the forcing kinds, which were cut down some time since, and are now commencing their growth, should be shaken out of the old soil, and, after having their roots trimmed, should be repotted in sandy soil moderately rich, placed in a close frame, and sparingly watered, till they have made some progress in their new growth. None of the sorts form more beautiful objects, or are better adapted for forcing, than the fancy varieties; and for this purpose a quantity of healthy plants should be expressly prepared. Last year, about this time, we selected a hundred bushy plants from the Pelargonium house, and placed them in an open situation for about three weeks; during which time they had very little water. We then gave them a moderate shift, and set them again in the open air; removing every truss of flowers as they appeared, until the plants were again set upon the stage in the end of September, where they continued flowering beautifully until Christmas.

FORCING DEPARTMENT.

PINERIES.—If the heating apparatus of any of these structures is at all defective, or even doubtful, the natural heat of the season admits of the artificial heat being now with the least risk dispensed with, and thus affords the needful opportunity for making the requisite alterations. It is annoying enough to have our arrangements disturbed at any time, but this is not equal to the vexation arising from an old boiler bursting, or a set of pipes or tanks giving way in the middle of winter; especially when due forethought and careful observation would have prevented the catastrophe. Withhold water from plants which are ripening their fruit; and the soil in which plants in other stages are growing should be frequently examined, to see that the constant syringings do not make it too wet, and thereby endanger the health of the roots. Do not, on the other hand, allow them to suffer from lack of moisture, either about the roots or in the atmosphere, and let them be supplied with a bottom heat of about 85°. VINERIES.—The most important thing to be attended to in the houses is to keep the red spider in check. Where this has been properly attended to during the last three months, and where syringing was not continued too long, the bloom will be uninjured, and the appearance of the fruit will thus be considerably enhanced; besides which, the plants are in a much better condition to perform the functions necessary for ensuring a good crop next season. Let this be kept in view during the rest of the autumn, as it is still more essential that the foliage of late Vines should be kept in the highest health to the latest period possible. Attend, when necessary, to the watering of inside borders, and to those on the outside which are covered with tarpaulin or other material. A slight mulching of decayed leaves or dung is very useful during summer, in preventing excessive or sudden variation in the state or temperature of the soil, and the cracking of the ground, and consequent injury to the roots in hot dry weather.

FLOWER GARDEN AND SHRUBBERIES.

Strict attention to neatness should prevail in this department, by rolling, sweeping, mowing, &c., and by pegging down half-hardy plants as they advance in growth. Do not allow any of these to extend themselves outwardly so far as to injure the edgings, whether of Box or turf; and in cleaning the shrub masses, where herbaceous plants or annuals have been planted or sown in vacant places, take care that the latter are not injured by the encroachments of these quick growing plants. Where flowers are planted in the circles of bare soil round specimen fastigiate shrubs, great care should be taken to prevent the lower branches of the latter from sustaining injury. Any annuals or half-hardy plants, whose season of beauty is past, should be immediately removed, and their place supplied from the reserve garden, planting sufficiently near to produce at once a dazzling display. The Roses should be again gone over, and all gross shoots that are not likely to flower this season, with those which have done flowering, and the dead flowers, should be cut out. Young strong growths of autumn flowering Roses in masses should be pegged down, and those of the summer flowering kinds, as the Moss, Provins, or Gallica varieties, should be layered; the whole surface of the beds should be forked over, and if a good soaking of liquid manure can be given, its effect will be very apparent in the greater permanency of the colours, and in the lengthened period of blooming. Remove dead flower-stalks from bulbous rooted Irises, unless seed is wanted from them; do not, however, disturb the foliage, until it is quite ripe. If any alteration in their arrangement is contemplated, it should be effected as early as possible after that time, as they commence making new roots immediately. White Lilies, which are now in beauty, should be taken up and replanted once in two years, and, as in the case of the Iris, this should be done as soon as the old stems are decayed. The beds for either of these plants should be prepared of rich loamy soil, containing a good portion of sand or burned clay, and charred refuse, with a sufficient admixture of soot to destroy all animal life. And in planting, a little sand should be laid above and below the bulbs.

KITCHEN GARDEN.

A few days of hot dry weather at any time during summer, renders it indispensable on the part of good gardeners to supply water artificially to some of their crops; as the check which the plants otherwise receive is very detrimental to their health, especially if they have been recently planted, or are natural inhabitants of marshy ground or the seashore, such as Celery, Asparagus, or Seakale. When the operation of watering is necessary, take advantage of such opportunities to stimulate the plants with liquid manure, if it is by any means obtainable. Proceed with the planting out of the various autumn and winter crops, selecting the most favourable weather for the purpose, and taking care that the ground has plenty of manure; and if there be any doubt about the quantity already dug being insufficient, let an additional portion of manure, and a good sprinkling of soot be forked in as the planting proceeds. Give every attention to all growing crops, so as to insure abundance and quality. Liquid manure will now be found of great service, and this, with stirring the ground deeply with a fork among the growing crops, is the sure way to succeed in realising the best results. Rampion, which is invaluable as a winter substitute for the Radish, should be transplanted from the seed bed into a south border. Care should be taken not to injure the tap root; and before planting any strong side shoots should be removed, to throw strength into the main one.

HARDY FRUIT GARDEN.

One of the most important things to be done at this time is the preparing of ground for new plantations of Strawberries, and planting them as early as possible, that they may produce a crop of fruit the first season. This they will do, and the fruit will be of the finest quality, if they are planted this month, and proper care taken to keep them well watered during dry weather until they are fairly established. Strawberries do best in a rather strong, rich, and deep soil. Where the soil of the garden is naturally light, improve it by adding marl or strong loam with plenty of manure. Rows of Strawberries along the edges of walks look well, and are very convenient, as the fruit can be gathered without treading upon the ground, while the quarters are relieved and made available for crops which it is desirable to place a little further from the eye. The earliest plants produced by this year's runners should be selected, and, in separating them from the parent plants, a few inches of the string should be retained to assist in fixing the plant in the ground. If they are planted on quarters, the rows should stand 2 feet apart each way. This will allow room for intermediate rows of Endive, Spinach, or dwarf York Cabbage this autumn, and the plants will require all the room next spring. By allowing plenty of room the fruit is finer, cleaner, and more abundant than when the plants are allowed to crowd one another and entirely shade the surface. The most desirable of the old kinds are Myatt's Eliza for a very early sort, Keens' Seedling and British Queen for general crops, and the Eleanor, which is very fine and comes in later. For preserving, none surpasses the old Grove-end Scarlet, and the Roseberry; but housekeepers are the best judges in preserving matters, and with regard to Strawberries they seem to be guided more by colour than by flavour.

State of the Weather near London, for the week ending July 10, 1851, as observed at the Horticultural Garden, Chiswick.

July
4—Overcast; very fine; clear and cold at night.
5—Fine; very fine; clear at night
6—Clear and fine; overcast. densely clouded.
7—Overcast; very fine; overcast and mild.
8—Cloudy and fine; thunder, with showers.
9—Overcast; cloudy and fine; rain at night.
10—Rain; fine at intervals; thunder-storm in afternoon.
Mean temperature of the week, 5½ deg. below the average.

State of the Weather at Chiswick, during the last 25 years, for the ensuing week, ending July 19, 1851.

| July. | Average Highest Temp. | Average Lowest Temp. | Mean Temp. | No of Years in which it Rained. | Greatest Quantity of Rain. | Prevailing Winds. | | | | | | | |

The highest temperature during the above period occurred on the 17th, 1834—therm. 94 deg.; and the lowest on the 13th, 1840, 15th, 1845, and 19th, 1832—therm. 41 deg.

## Notices to Correspondents.

ADULTERATIONS: *Sinapis.* Do not be misled by the statements about shop adulterations. Recollect that much of the truth of these statements applies only to low and poor neighbourhoods, and that the facts themselves are often very highly coloured. As to Mustard, you have nothing to do but to procure the common white Mustard-seed of the shops, to grind or pound it, and the siftings will be what you want; but such Mustard, although pure, will probably be unpalatable and intolerably pungent.

ANATOMISED PLANTS: *G H.* We are unable to inform you how the most beautiful specimens of anatomised plants, from Miss King, of Edmonton, in the Great Exhibition, have been prepared. We can only say that they are wonderfully fine.

ASPARAGUS: *A S.* There is no particular indication of the proper time to leave off cutting Asparagus for use. The appearance of green Peas is the general signal for laying aside the Asparagus knife. But previously to that, it is advisable to let a portion of the beds proceed in growth. Those intended to be soon destroyed, or to be taken up for forcing, should be cut the latest. The haulm should be cut down when it becomes dead; it is of no further use to the plants, and would afford very little manure if dug into the trenches.‖

BEES: *W H C.* It is an unneighbourly and disgraceful act to appropriate your bees, and the person who does so ought to be sent to Coventry by all his acquaintances. We believe that you have a right to follow your bees as long as you do not lose sight of the swarm; that at least is the custom, if not the law. But if a question of law arises, you must consult a lawyer, who will probably show your bee-stealer that what is yours is not his.

BIRDS—NIGHTINGALES: *M W K.* There can be no possible objection to your keeping the two young nightingales together, in one cage, for another month. They must then have separate apartments. If males, the birds will soon "record" their song, while sitting on their perches; if females, they will mope and keep silence. Let us hope that *both* your little friends are of the "singing class." *W. K.*—FRUIT-DESTROYING BIRDS: *Avis.* If you can persuade your gardener to form a good opinion of *any* bird frequenting your kitchen garden at this season, you will do what has scarcely yet been ever done. The gardener's business is to preserve his fruit; and a gun is his only argument against all offenders. The "Eighth Commandment" is too indelibly imprinted on his memory, to be ever erased; and for one act of pity or compassion shown by him, he would feel bound to exterminate the whole race, by way of satisfaction to his conscience. The birds you request to have named, are—sparrows, the titmouse, the wren, robin, chaffinch, thrush, blackbird, bullfinch, starling, garden warbler, whitethroat, and swallow. This last is purely insectivorous; and if destroyed, it must be from very wantonness of cruelty. The starling, bullfinch, chaffinch, blackbird, and thrush, are, it must be confessed, depredators on the orchard, during the fruit season. The others, however, may be said rather to indulge their appetite with an occasional "treat" of fruit, than to live on it, insects being their legitimate food. The garden warbler, and black-cap, with other of our little summer visitors from foreign parts, certainly do love ripe fruit; but their depredations are *not* heavy, and they give ample "value" in their song. Try and get your gardener to credit this,—and assure him that *but* for these birds, which, in the spring particularly, devour insects and caterpillars by the million,—his garden would never have been what it now is. *W. K.*—THE SKYLARK: *Susanna Y.* Your bird is husky. Give him boiled milk for two days, instead of water; and keep him out of the reach of all draught. *W. K.*—THE LINNET: *Augusta M.* Your cage must be infected with vermin. Destroy it instantly, and procure another. The bird "droops," because these blood-suckers are living on his body. Wash him carefully in tepid water once daily; and when dry, with your finger raise his feathers, and search for the enemy. The water will soon make them decamp. *W. K.*

CARNATIONS: *A Subscriber* asks, "How long Carnations will last, no pipings or layers being taken from them; but the original plants left in a state of nature." Hardy strong growing kinds will last six or eight years; but there are many that will not stand at all if the winter proves wet. The latter is more injurious to them than frost.

GREAT EXHIBITION: *J W H.* There are no specimens of the wood of the Deodar, Abies Douglasii, or Araucaria imbricata in the Crystal Palace.‡

INSECTS: *W G.* The two insects sent are the real wire-worms; that is, the larvæ of Elater striatus, or some closely allied species of skip-jack beetles. *W.—Chirurgicus.* The little black flies found on the ears of Wheat are parasites on the larvæ or grubs of the Wheat midge. They are named Platygaster tipulæ, and belong to a family allied to the Ichneumons. A useful microscope, of small size, may be had for about 30*s.* Pritchard's "Book on the Microscope" will answer your purpose. *W.—Anon.* Cynthia Cardui, the painted lady butterfly, passes the winter in the egg, as well as the chrysalis and perfect states, and is consequently to be found perfect at other times than August. Those which you describe, and others which we saw at the end of June, were most probably the produce of the last autumn butterflies. We believe the habits you mention, which we have also observed, to be peculiar to the males. *W.*

LIANES: *Isabella.* This is the name given to all sorts of strong woody, climbing, and scrambling plants found in tropical forests. We have no idea what is meant by a plant so vaguely described as the prickly Liane of South America.

MOSS ROSES: *E F L.* The most certain method of propagating them is perhaps by layers.‡

NAMES OF PLANTS: *C M H* Arum Dracunculus.—*Irish Sub.* Common Spearmint.—A few inquiries stand over for further consideration.

NEW GARDEN: *Clapham.* Your new sandy soil wants chalk, and clay, and manure. Having drained, clayed, and chalked it well, as soon as you can, let it be well mixed, turned over, and exposed to the weather, till you want to use it; then give it a heavy dressing of rotten dung. Do your ground work while the days are long, and the weather dry. To furnish you with directions for all the details that have to follow, would be to write a treatise. You will find ample information upon every possible question if you consult the Indexes of our volumes, which you appear to possess. If you have them not, then you would do well to procure Loudon's "Suburban Gardener," Neill's "Fruit, Flower, and Kitchen Garden," "The Manse," and similar books.

PINUSES: *J W R* We doubt much if you will be able to procure seeds of the Pinuses you mention. Worked plants of them may be had of some of the great London nurserymen.‡

PINE APPLES: *X.* Perhaps the best material to mix with your poor loam is sheep droppings; but you must not manure too heavily, or the plants will make leaves at the expense of fruit.‡

ROSES: *Anon.* The Rose you inquire about is Hybrid Chinese Fimbriata ‡

SEAKALE: *Anne.* If you do not want seed, by all means cut the flowering stems off your Seakale. They impoverish the crop for next year.‡

STRAWBERRIES: We have received from Mr. Myatt of Deptford, fruit of a new seedling *five*-leaved Strawberry, raised by him. Its parentage is not mentioned. We find it to be a stout hairy-leaved variety, capable of bearing enormous fruit, six of the berries having each measured 5¼ inches in circumference, and having together weighed 7¼ ounces. If the sort should continue to produce thus, it cannot fail to have a high market value: but we must add that this, like all the large coarse Strawberries, will not bear comparison, in flavour, with the old Pine.—*A Z.* The old Scarletis the very earliest, and we believe Turner's Pine is the very latest; but as the first is a shy bearer, and the last has but indifferent flavour, we should prefer Cuthill's Black Prince and the Elton.‖—*Fragola.* The best way of securing them against the depredations of birds is to net them.‡

VEGETABLES FOR DIFFERENT SOILS: *Clericus.* On almost a complete chalk your cottagers may grow, with the assistance of such manure as they possibly can collect, Potatoes, Onions, Bishop's Longpod, or other dwarf Pea; Mazagan Bean, planted in autumn, winter, and spring; Negro, or Black Belgian Kidney Bean, sowing them in rows 16 inches apart, in order that they may completely shade the ground; some Vegetable Marrows and Gourds, more especially the egg-shaped, may be profitably grown by planting in holes filled chiefly with manure. On low spongy soil, you may grow most kinds of Vegetables suitable for cottagers. Potatoes, Carrots, Parsnips, on ridges; Celery, in trenches; and Lettuces intermediately on the ridges. In short, from your stating that this spongy soil is by the banks of a swiftly running stream, we presume that sufficient drainage may be effected, and then every necessary vegetable can be grown.‖

MISC: *Northwood.* Do not shorten your Apple and Pear shoots before the middle of August. Transplant your Asparagus after the shoots have died down. Nine inches will be sufficient distance apart.‡

SEEDLING FLOWERS.

PELARGONIUMS: *J Berry.* Your seedlings are not so good as some of the old kinds; but one or two of them are well worth keeping, on account of their brilliant colours; 3 is especially remarkable in this respect.*

ROYAL AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.—The ANNUAL MEETING and GREAT NATIONAL CATTLE SHOW of this Society will take place this year in Dublin, at the Royal Dublin Society's Premises, Kildare-street, on WEDNESDAY, AUGUST 13TH, and the days following, on which occasion ONE THOUSAND POUNDS and upwards, including the Challenge Cup and Medals of the Society, will be offered in premiums for Cattle, Horses, Sheep, Swine, Poultry, Dairy Produce, Flax, and Agricultural Implements, the particulars of which, together with Prize Sheets and blank forms of Entry, can be had on application to the Secretary.

Monday, the 21st of July, will be the last day for lodging notices of Entry for the Show, after which day none can be received.

All Implements must be in the Show Yard on or before Monday, the 11th of August, as the Judges will commence their inspection on Tuesday morning early.

All Stock and other articles, except Horses, must be in the Show Yard before 6 o'clock on Tuesday, the 12th of August, when the gates will be closed.

The city of Dublin Steam-packet Company have undertaken to carry all Stock and Implements, regularly entered for Exhibition, free of all expense from Liverpool to Dublin, on producing the proper form of certificate, to be had from the Secretary.

Signed by Order, EDWARD BULLEN, Secretary.
Society's Rooms, 41, Upper Sackville-street, Dublin.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.
40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | | |
|---|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

HOSE FOR LIQUID MANURE, Fire-engines, and agricultural purposes, made of canvass, lined and coated with gutta percha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure; it is extensively used at the Government public works, also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

ANTHONY'S PATENT AMERICAN CHURN has obtained a Prize at every Agricultural meeting at which it has been exhibited; and the Proprietors have sold upwards of 2000 in one year, and received from all parts of England the highest testimonials in its favour both as to the short time required, the quantity and quality of the Butter made, a copy of which testimonials, with prices, will be forwarded on application to BURGESS and KEY, 103, Newgate-street, Sole Agents to the Proprietor.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.

PATENT VULCANISED INDIA-RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and) Manufacturer, Goswell Road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use; are particularly suitable for Fire Engines, and are found exceedingly useful in dwelling-houses for conveying Hot or Cold Water to Baths, &c.

Testimonials and prices may be had on application to the Manufactory.

N.B.—Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

All Letters or Orders addressed to J. L. HANCOCK, Goswell Mews, Goswell Road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boats, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abethaw Lime, and Roman Cement. Fine Black, 25l. per ton, and Rich Purple-brown, 20l. per ton.—Offices of the Company, 1, New Broad-st., London.—JOHN A. WEST, Secretary.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-poor Paint ever invented, for the preservation of every description of Wood, Iron, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON and SON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange, London.

No Agents.—All orders are particularly requested to be sent direct.

**The Agricultural Gazette.**

*SATURDAY, JULY* 12, 1851.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, July 15 } Meeting of the English Agricultural
WEDNESDAY, — 16 } Society at Windsor.
THURSDAY, — 17—Agricultural Imp. Soc. of Ireland.
THURSDAY, —

Mr. PUSEY has stated, in his review of agricultural knowledge in England (Eng. Ag. Journ., vol. xi.), that "except LIEBIG's suggestion for dissolving bones with acid, and Sir R. KANE's for using Flax water as manure, he knows of no agricultural process arising out of chemical discovery:" and again, "the more we value the labour of agricultural chemists, the more warmly we look forward to their future progress through the patient examination of existing practice, which is, itself, the accumulated and varied science of ages, the more we should discourage undue expectation of immediate advantage. It is a great mistake to suppose that men can be made farmers by teaching them doubtful chemistry."

Baron LIEBIG, on the other hand, in the third edition of his "Familiar Letters on Chemistry," says, "Those who should believe, in Germany and other countries, that the above remarks of the former president of the Royal Agricultural Society of England express the public opinion of England, would deceive themselves; and as an honorary member of that Society I regard it as a point of honour to contradict the statements of Mr. PUSEY."

Now the relations of science to agriculture, and especially those of chemistry, constitute a subject on which it is very desirable that a sound public opinion should exist, and it may therefore be desirable to examine the differences which appear to exist on this point between these two authorities. The questions, What is public opinion? and, What ought it to be?—are of course entirely distinct. As regards the former we believe that Mr. PUSEY, who certainly is in a better position for ascertaining it, is better informed than M. LIEBIG. Since the great German chemist was in this country a considerable change has taken place in the opinions of agriculturists on chemistry as their instructor: and, in deference to this change of opinion, as well, probably, as in deference to their own better acquaintance with the true relations in which they stand to agriculture, the chemists of this country do not now adopt so confident a tone as they formerly assumed when discussing the details of farm practice. Take the case of gypsum, to which Messrs. PUSEY and LIEBIG both appeal, as an illustration. The latter gentleman asserts that every tyro in chemistry knows perfectly that thousands of cwts. of sulphate of ammonia have been made by simply bringing powdered gypsum into contact with carbonate of ammonia: the former has applied powdered gypsum to his dung-heaps, and finds that it does not check the escape of ammoniacal vapours. Baron LIEBIG speaks with all the confidence of a chemist 10 years ago: we do not at present dispute his accuracy; we merely wish to bring this to bear on the question—What is the existing public opinion of agricultural chemistry in England?—and we ask our readers to contrast his tone with that of Professor WAY, in addressing an English agricultural audience on this very subject.

The chemist of the English Agricultural Society, after discussing the opinions of chemists on this point—which cannot be so simple and elementary a matter as M. LIEBIG generally succeeds in convincing us that all his doctrines must be—after showing the bearing of his own most valuable researches on the subject—confesses that the current theories wholly fail to satisfy us, and yet that he is unprepared to offer any other in their place, and he says most truly that it is better to confess our ignorance and wait patiently for the light of truth, than to hazard conjectures which will not bear a close scrutiny, but serve only to retard the progress of knowledge. Well might Mr. PUSEY speak of "doubtful chemistry" in its relations to agriculture, had he no other instance than that of gypsum to appeal to. Sir H. DAVY taught that its value arose from its direct agency as the food of plants: LIEBIG teaches that it acts as the vehicle of ammonia, BOUSSINGAULT as that of lime, and Mr. WAY, perfectly competent to criticise their theories, pronounces them all untenable, and confesses his ignorance. We may be glad that in this country we have a public opinion amongst intelligent agriculturists, which does not look for positive, and absolute, and definite instruction on farm practice, at the hands of chemists, which, in fact, whatever M. LEIBIG's opinion of the subject may be, looks cautiously, and almost suspiciously, at such instruction when it is offered. That we have such a public opinion is proved both by the way in which Mr. PUSEY's review has been received and by the style which the chemists of the Highland and of the English Agricultural Societies adopt in their addresses, as contrasted with that which characterises those of Professor LIEBIG. And that we may be glad of it, we argue not merely because we are thereby saved from losses attending the hasty adoption of ill-considered doctrines; but because the more rapid progress of chemical knowledge, and the higher respect for it amongst our agriculturists, from which great benefit may be expected, are both of them thereby the better ensured.

But what ought public opinion in connection with this subject to be? for M. LIEBIG's contradiction of Mr. PUSEY's assertions may relate not to the nature of the existing public opinion, but to the particular topics which are referred to as justifying it. Now we could wish for no better public opinion on the subject than that which Mr. PUSEY himself, and we have no doubt the great majority of intelligent farmers already hold; and for the soundness of which, we, as farmers, and the professors of an *art*, may, without presumption, contend with M. LIEBIG, who, though most highly distinguished as the professor of a science, is not a professional agriculturist. The public opinion then, that seems most desirable, is one which, while it admits the great value of that knowledge of causes which chemistry is continually approaching, shall, at the same time, hold very loosely the trustworthiness of individual doctrines, especially those of recent date, which have been subject to the test of mere laboratory experiment. Of course, we do not pretend to ask any one to suspend his faith in those facts of chemical science on which all men of science are agreed: we advise merely that he should not place the *theories* of agricultural chemistry on the same step in the scale of trustworthiness with those chemical and agricultural facts with which they are connected. We quote a first-rate authority when we say, that the chemistry of soils has, as yet, scarcely been investigated, and we have only just now learned that chemical changes, which in the abstract form are looked upon as axioms of science, are suspended or altogether reversed when the soil is the sphere of their operations.*

It is surely quite possible that distrust of much of the existing theory of agricultural chemistry may co-exist with a full conviction of the great value of the true theory, to which we are making daily approximations; we have no doubt that this distrust and this conviction exist in many of the most intelligent minds of the present day, among both the farmers and the chemists of England. That the former will gradually and reasonably disappear, while the latter shall wax stronger and stronger, we have every reason to hope and believe.

## REPORT ON THE AGRICULTURAL SECTION OF THE GREAT EXHIBITION.

No. IX.—Machines of local use occur in the Agricultural department,—as, for instance, Hop-bagging machines, for compressing Hops into their bags, after the same manner that powders and many articles of grocery, &c., are squeezed into packets and cases. These machines are designed to effect, with less expence of time and labour, the work usually done by men's feet. There are also specimens of Cider-Mills. We observed one hand mill by Pearce, of Poole, Dorsetshire, which crushed the apples between ribbed rollers of a peculiar form, and will grind about 30 bushels per hour. It has wheels of different speeds, to suit the condition of the fruit.

Apparatus for SHEEP-DIPPING seems to be included in implements, &c. for the fold. Bigg's admirable contrivance is exhibited; and the convenience of the vat, the excellence of the "drain," and the suitability of all the parts to sheep of all sorts and sizes, appears to be all that a flock-master can desire in this way. We noticed a "Sheep-dipping Apparatus and Sheep carriage, in one machine." designed by R. M. Rome, of Langholme, Dumfries, which must be valuable to the shepherds of moorland sheep-walks, or of large grazing farms. The vat is made with an ascending curve at one end, up which the sheep, after being dipped, is to walk into the waggon and down an inclined board at its other end. But the vat is only about 20 inches in width; and would be useless in Lincolnshire, or on the Cotswold Hills, the sheep there being far too elephantine to be squeezed into it.

The most novel instrument for the service of the flock,

* Professor Way, article "Gypsum," Cyclopedia of Agriculture.

is the "Syphon apparatus for the washing of sheep, and improving the growth of wool by a copious application of pure water;" invented by W. W. Fyfe, of Edinburgh. In order to decide upon the usefulness of this contrivance, it will be necessary to determine first, whether washing improves the growth of the wool, and second, whether this new mode is better than that now in use. The wool is nourished by a peculiar secretion from the glands of the skin, called the yolk, a kind of animal soap, soluble in water. The greater part of this matter is removed by the process of washing. When there is a deficiency of yolk, the fibre of the the wool is dry, harsh, and weak, and the fleece becomes thin and heavy. Where the natural quantity of it is found, the wool is soft, oily, plentiful, and strong. It is found in greatest quantity about the breast and shoulders—the very parts that produce the best, healthiest, and most abundant wool—and in proportion as it extends to any considerable degree over other parts, the wool is then improved. It differs in quantity in different breeds; it is very abundant in the Merinos, and is sufficiently plentiful on most of the southern breeds; but in the northern districts, where the cold is more intense, and the yolk of the wool is deficient, a substitute for it is sought by smearing or salving the sheep with a mixture of tar, and oil or butter. Both the natural yolk, and the use of salve, improve, strengthen, and increase the quantity of the wool. Youatt says they have, "in a thousand instances, been manifestly beneficial to the sheep and the wool, and in no case been proved to be injurious." We should not, therefore, think it advisable to wash away this indispensable nourisher of the wool. In Spain, and also in Devonshire, we believe the short-woolled sheep are never washed. The process of washing before shearing, is merely to cleanse the fleece of dust, dirt, and other impurities; and so easily does the yolk or soapy matter dissolve in the water, that the wool is generally sufficiently washed by a good sousing and a little rubbing in a stream. As regards the feasibility and convenience of the syphon-washing, we very much doubt whether it will prove superior to the mode practised in many parts of England. Driving the sheep into a running stream, in which men stand to catch them, turn them over, and let them swim out on to the opposite bank, may be a good method among small sheep; but the following is the plan to which we refer:—A large pond or a brook, widened into a reservoir, forms the "wash-dyke," across which, a number of stakes or poles are set in two rows, so as to include a swimming-path between them, a rope on each side this gangway forming a fence for the sheep. At one end is a platform adjoining the sheep-pen; two men seize a sheep, put a stick under his belly, grasp the wool on his neck, and, carrying him to the brink, throw him tail foremost into the water. He sinks, and, rising again, finds himself swimming with four or five others in a small area enclosed with a rope, and called the "vat." Here, by struggling against his companions, and by being rubbed with a wooden instrument, called a "poy" his wool is well soaked, and half cleansed. The washer stands in a tub in the water fast to a post, and by lifting the rope, takes the sheep, one by one, out of the vat, and rubs them well, turning them on their backs, and when sufficiently washed, sending them along the "swim," their heads being held up and guided by a man with a poy, walking along planks laid for the purpose. It is very rarely that a sheep is drowned; and, with proper care, they are but little fatigued with the adventure.

The new syphon apparatus consists of a wooden washing-trough, and syphon tube of iron. The trough is 4½ feet long, by 3½ feet wide, and 2½ feet high, so as to hold one sheep at a time. It is provided with woollen girths, such as are used in the hot bath, buttoned across the top, and on these the sheep is rested or slung, with its feet just clear of the bottom; and thus suspended, may be operated on without any struggles occurring. In rests attached to the side of the trough, an iron rod is placed for the support of the syphon. The syphon-tube is of an inch bore, and is expanded to a span of 4½ feet, surmounted at the bend by a box or reservoir, for containing water enough to replenish both arms of the tube, in order to prepare it for action. The longer arm is furnished with a horizontal spreader, consisting of a perforated tube, which can be directed either longitudinally or transversely across the back of the sheep. As the apparatus cannot work unless the spreader be at a lower level than the surface of the water in the reservoir, in which the shorter leg is placed; consequently a hole has to be dug in the ground, and the washing-trough let down into it, which must be attended with much inconvenience. And those who have tried to perform the offices of ablution upon a sheep, without immersing him, will support our opinion that this new method is not calculated to cleanse the wool so thoroughly in every part as the operation we have described, and that the great expense of time and labour will not be compensated by the extra quality of the tub-washed fleece. If the wool is to be perfectly purified by soaps and leys, let it be done without subjecting the live animal to the same process. Let the flock-master have clean wool to sell; but it can be no part of his business to dress it and prepare it, while yet unshorn from the animal's skin, and pass it, as it were, through the first stage of its manufacture.

Even in a scrutinising survey of the agricultural department, it is hardly possible to catch a sight of every article; and during a few days previous to the opening, in which the "fourth estate" of this realm, as well as the first, was allowed a private inspection, several machines, particularly models, were under cover, and so not likely to arrest the novelty-seeking eye. It thus happened that we have passed by some implements which we ought to have mentioned in their proper places. We find that there are one or two small models of Steam-cultivators besides those already described; and likewise a newly invented clod-crusher, which certainly deserves special notice. At a future time we may give a description of the contrivances denominated steam-diggers or steam-ploughs; and at present merely furnish a short outline of an omitted clod-crusher, and a Steam-plough. Of the implement which aspires to rival and out-crush Crosskill's, we can only give our readers a general idea taken from the maker's description, without attempting to detail its merits. It was invented by Dr. Sillar, and is exhibited by H. Bennett, of Liverpool, and consists of a number of serrated rings, without arms or spokes, bolted together at a certain distance apart by three round bars, which pass through holes in the rings, an empty space being left in the centre. The outside rings have arms, and are the only ones running upon the centre axle. This works on bearings in two iron ends, and a centre stay, fixed to a wooden frame carrying the shafts. Each ring is so formed that the outside edge is a little thicker than the inside one, *i. e.* they gently taper from the external to the internal edge, so that any part of the clod being squeezed into the space between any two of the rings, if dry, falls into the interior as it is broken, and if damp, is squeezed through at the next revolution of the roller; so that the implement is perfectly self-cleaning. In comparing this clod-crusher with Crosskill's, the inventor says, "As the principle by which Crosskill's is self-cleaning, consists in every wheel having an independent motion on the axle, it follows that the combined friction of all the wheels would render it impossible to be worked by the ordinary horse-power of even a large farm; and, therefore, to obviate this he has made the axle itself to revolve, the consequence of which is, that in a large field where there is no necessity to turn, it is no better than if the wheels were all fixed, and consequently it gets choked up—it is only by frequent turning, so that the wheels may move at different velocities, that it can be kept clean; therefore, Crosskill's is not self-cleaning in large fields, as mine is. 2d. As all the wheels in Crosskill's revolve separately, each wheel must have its own arms; and as these are equal in weight to the rims, Mr. Crosskill has been obliged to make his of a very small diameter, and consequently of very heavy draught."

In Sillar's roller, the weight is thrown to the outside of the cylinder, and the great friction of all the rings bearing on the centre shaft is avoided. It is also made in two pieces, for convenience of turning. The rings are so fixed upon the three external shafts, that each alternate ring is made to rise at two or three parts of its revolution, thus effectually crushing all clods which might have a tendency to stick in the teeth. This implement appears well calculated to diminish friction and to lessen draught; but we should fear that the peculiar form of the rings is scarcely a substitute for Crosskill's smaller teeth projecting upon each side of the rings. We hope that it may answer the promise contained in its description, and that it will crush the clods which it clears from itself as efficiently as Crosskill's does—the vibrating, ragged wheels of which when they take up a clod shake it as a terrier might a rat, and there is then but a small chance for it to escape unbroken. The price of Sillar's crusher is to be more moderate than the Beverley one.

We now offer a few observations upon an engine denominated in the catalogue—"Model of locomotive steam-plough; the ploughs revolving behind the carriage act as propellers: patent,"—invented by J. Usher, of Edinburgh. The exhibitor says that he expects the full-sized machine to be ready to take the field in July with locomotive engine and all complete; and as the model has been approved of by hundreds who have seen it at work, he hopes soon to show the large one to the same advantage. And he further affirms it to have all the requisites emanating from "C. W. H.;" to which we have alluded. From the *Agricultural Gazette*, for September 21, 1850 (No. 38) in which appeared the remarks of that writer, whose essays are no less an ornament than a treasure to our agricultural literature—we extract the following:—"I hold it to be an idea *fundamentally erroneous* to attempt to combine steam-machinery with the plough. . . . . It is *no essential whatever* of cultivation that it should be done by *the traction of the implement*. Spade-work is perpendicular. Horse-work is horizontal. Machine-work is *circular*. . . . Why should not a strip or layer of earth be cut up into fine soil *at one operation*, as easily as a circular saw cuts a plank into saw-dust? As to employing a steam-engine to turn a drum, to wind up a rope, to drag a plough, to turn up a furrow, and all this as a mere prelude for an after-amusement to all the ancient tribe of harrows, scufflers, rollers, and clod-crushers, to do supplementally the real work of cultivation, it reminds one of 'the House that Jack built.' . . . . The mere invention of *the subsoiler* is a standing commentary on the mischief done by the plough." He then suggests an instrument of 6 or 7 feet width, not *rolling* on the ground, but performing *independent revolutions* behind its locomotive, cutting its way down into a semicircular trench about 1½ foot across, and "throwing back the pulverised soil just as it flies back from the feet of a dog scratching at a rabbit hole: then imagine the locomotive moving forward on the hard ground with a slow and equable mechanical motion, the revolver behind, with its cutting points playing upon the *edge* or *land-side* of the trench as it advances, moving always *forward*, and leaving behind perfectly granulated, and precisely *inverted*, by its revolving action, a seed-bed seven or eight inches deep. . . . . The teeth of a saw clear themselves, by the centrifugal motion they communicate to the particles they have detached from the substance they act upon. A circular 'cultivator' steam-driven will do the same, for I have proved it." No machine answering to this description is exhibited; but Usher's Steam-plough and a 'Model of a Digging-machine" invented by J. Parsons, of Craven Farm, Stamford Hill (which we intend hereafter to describe), both profess to fulfil the conditions indicated by "C. W. H.,"—the inventor of the latter having planned it in consequence of the remarks published by him.

As the steam-plough is likely to appear before long in the open field, to try its powers in earnest, it will be premature to praise or to condemn; but still we may give our impressions respecting its efficiency or failure which its appearance promises. It consists of a locomotive steam engine carrying behind it an axle parallel with the axles of the carriage wheels, and upon this are mounted a series of ploughs which are made to revolve and come successively and momentarily into action. There are five plates or discs upon the axle, each carrying three ploughs with coulter blades, the shares and mould-boards being formed to a curve struck from the centre; and they are so arranged that only one share-point strikes the ground at one time. These ploughs revolving as the machine advances at a slow rate, turn over as it were five furrows in curved pieces or ploughsful. Both the ploughs and the main roller upon which the machine rests are turned by cog-wheels from the crank shaft of the engine; and the action of the ploughs meeting with the resistance of the earth assists in propelling the locomotive, after the manner of a stern-wheel paddle of an American steam-boat. There is no need to enter into a longer detail, except to say that the plough axis works in bearings upon a lever frame, which can be raised or lowered, and that the two front-wheels can be steered by a crank pinion and circular rack. Each of these ploughs is essentially a wedge, but as there is no sole, the pressure sustained by the sole of a common plough is here transferred to the main axle; this varies in an exact ratio with the weight of sod lifted, *plus* that of the force required to effect the cleavage, and this must render the friction of the axle in its bearings very great; and must tend to drag down the lever frame, and lay an enormous downward pressure upon the carriage roller or wheels preceding the ploughs. The side-long pressure sustained by the ploughs in turning over the earth, when lifted, seems to be counter-balanced by the resistance of the unploughed ground to their "land-sides;" otherwise, the whole machine would swerve itself round just as a screw steamer would turn round if her propeller were fixed athwart her stern. As it is, we do not see how the machine can be steered. By changing the direction of the front-wheel axle it is intended that the fore-part of the machine should advance more to the right or left; but as the roller or else a pair of wheels carrying the principal weight is situated about half-way between the front wheels and the ploughs, it forms a fulcrum upon which the frame turns sideways, so that the front could not move to the left without the ploughs at the other end being moved to the right; and as the resistance of the unturned land prevents their thus moving excepting on one side, it is difficult to understand how the line of progress of the machine can be directed. The inventor's description speaks of employing tines or teeth of any suitable shape in place of the ploughs, and applied about an axis in the same manner. Something of this kind would meet the ideas given at the commencement of this notice; but bent ploughs like those of this model would not complete the operation of preparing a seed-bed, and "play out the long comedy of our present field cultivator in *a single act*;" the whole would amount to little more than a substitution of steam for horse-power in the preliminary process called "ploughing." For our own part, we anxiously wish for a reasonable implement which shall perform all that "C. W. H." proposes; but while we believe an independently revolving apparatus attached to, and partly propelling, a locomotive engine, to be the best in principle, we cannot think that the desired end will be attained unless the cutters themselves have each a separate motion, to allow of their entering more freely into hard ground, and enable them to shake and turn the soil which they throw behind them. Perhaps a number of spades or forks arranged so as to have the necessary movements while revolving round an axis, may be nearer to the right idea. *I. A. C.*

## THE TRANSFER OF LANDED PROPERTY.

A LECTURE upon this important subject was given last Tuesday at Willis's Rooms, by Mr. Rainy, the celebrated auctioneer. The subject of the lecture, as stated in the circulars, was, "the present legal system of conveyancing, and also that of effecting sales by public auction and private contract, illustrated by cases; proposals of a remedy for the existing evils and abuses, for facilitating the completion of contracts, lessening the expenses, and for checking litigation, whether in respect to the courts of equity or law."

The lecturer began by comparing the different methods pursued in this country for transferring funded and landed property, remarking that nothing could be simpler, quicker, and cheaper than the transfer of the former; or more complicated, more tedious, and more expensive than the transfer of the latter. The reasons for this difference were not, the lecturer asserted, founded

upon any principle intelligible to the common sense of mankind, although no doubt historical and technical reasons might be, and were given, for the existence of such difference. The question he wished to have answered by those who defended the complicated system of conveyancing at present in use in Great Britain and Ireland was, not why such difference did exist, but why it should any longer exist? Why landed should not be as easily passed from hand to hand as funded property? In early stages of civilisation land was transferred as easily as a watch or any other chattel, and in proof of this he mentioned the earliest sale recorded in history, namely, that of the field in Machpelah, by Ephron, to Abraham, when the latter paid 400 shekels of silver for the land, and the former gave it to Abraham without more ado.

The great evils of our system of conveyancing were stated to arise from the necessity of investigating the title of the seller every time land was offered for sale. If a person wished to purchase land he was put to an enormous expense and immoderate delay in ascertaining whether the vendor had a right to sell; voluminous abstracts of title had to be perused, doubts to be answered, and technical objections to be overcome before he felt himself safe in completing the contract he had made. If, having at last obtained the property he wanted, he in his turn wished to sell it, or raise money upon it, the very same process had to be gone through before his object could be accomplished. This state of things had lasted for ages, but had at length become intolerable; the public had long been calling for a change, and they would long ago have had their desire had they not, as the lecturer asserted, been thwarted by those interested in keeping up existing abuses—by those members of the legal profession who looked after their costs much more than the interests of those whom they professed to serve.

The first step in the way of reform was to insist upon and to obtain a register; a register had long been called for, but had not yet been obtained; the lecturer was, however, pleased to see by the report of the "Registration and Conveyancing Commission," published last year, that the importance and necessity of a general register was strongly urged by several learned members of the legal profession, and that Lord Campbell, acting upon that report, had brought forward and passed through the House of Lords a bill for carrying such recommendation into effect. The lecturer did not say much in favour of this bill; though sound in principle, its practical working would, he was afraid, prove expensive and troublesome, though far less so than the present system. Having obtained a general register, the lecturer would compel every person who wanted to sell or mortgage his property to register it before bringing it into the market. That this might be effected, he proposed to have a standing commission of five persons, somewhat similar to that appointed in Ireland for the sale of encumbered estates; this commission should examine the state of the title to the property in question, and if this were satisfactory, a sealed certificate to that effect should be given to the owner; with this certificate he should go to the registrar and be registered as owner; the commissioners' certificate, coupled with a certificate of registration, should be a complete title to the property; when those two certificates had been obtained, and not till then, should the property go into the market; they might then be transferred like any ordinary chattels to whomsoever chose to buy them, and such person would, on obtaining the certificates and a receipt for the purchase money, become absolute owner, without trouble, needless expense, or delay.

Such is an outline of Mr. Rainy's scheme for facilitating the transfer of real property in this kingdom. As the plan of one who has been all his life engaged in conducting the sale of land, it deserves consideration.

## CRITIQUE BY LIEBIG ON MR. PUSEY'S PAPER IN VOLUME XI. OF THE ENGLISH AGRICULTURAL SOCIETY'S JOURNAL.

In the Journal of the Royal Agricultural Society of England, Vol. XI., Part II., there appeared last year a paper by Mr. Philip Pusey, on the progress of agricultural knowledge during the preceding eight years, in which, when considering the influence of chemistry upon agriculture, he concludes as follows: "The mineral theory too hastily adopted by Liebig, namely, that the crops rise and fall in direct proportion to the quantity of mineral substances present in the soil, or to the addition or abstraction of these substances, which are added in the manure, has received its death-blow from the experiments of Mr. Lawes." "Mr. Lawes," our best authority," Mr. Pusey adds, "has certainly shown this much, that of the two active ingredients of manure, the ammonia is especially suited to grain crops, the phosphorus for Turnips, and that the woody matters of straw are probably advantageous for Turnips. Except Liebig's recommendation to dissolve bones in sulphuric acid, and Sir Robert Kane's, to use Flax-water as manure, there is," says Mr. Pusey, "no improvement in agriculture which has been derived from chemical discoveries." "It is a great mistake to suppose that we can make agriculturists by teaching them doubtful chemistry."—(P. 392.)

Those who should believe, in Germany and other countries, that the above remarks of the former president of the Royal Agricultural Society of England express the public opinion of England, would deceive themselves; and, as an honorary member of that society, I regard it as a point of honour to contradict directly the statements of Mr. Pusey. Mr. Pusey is not a chemist by profession, and the extent of his acquirements in chemistry as a science, is sufficiently shown by his statements in regard to the formation of fat, in the feeding of stock, from starch and sugar, which he declares, in the same paper, is denied by Boussingault and Dumas; as well as by his notion that gypsum must be dissolved in 500 parts of water before it can be transformed by the action of carbonate of ammonia into sulphate of ammonia and carbonate of lime. It is precisely M. Boussingault who has given the strictest experimental proofs that starch really possesses the property of becoming fat in the body of animals, and M. Dumas who has proved that sugar is converted into wax in the body of the bee; from which it does not of course follow, as Mr. Pusey supposes, that starch is to be given to animals by preference, with the view of producing fat. Moreover, it is known to every tyro in chemistry, that thousands of cwts. of sulphate of ammonia have been made by simply bringing powdered gypsum into contact with carbonate of ammonia, and that in the manufactory of Nussdorf, near Vienna, the same process—treatment of gypsum with the distillate of putrid urine—in all probability, is still employed.

Chemistry, during the last 8 or 10 years, has given to agriculture the most complete explanation of the nutrition of plants and of the sources of their food; it has shown that plants must obtain from the soil as well as from the atmosphere a certain number of elements, if they are to be developed and to thrive on the soil; it has explained the causes of the advantage derived from the mechanical preparation of the soil, from quick-lime, from fallow, and from the rotation of crops. Chemistry, therefore, has given to agriculture, the object of which is the profitable production of plants, during these years, a scientific basis which it did not previously possess, and has thus supplied the first and most important condition of progress and of improvement. The fact that Mr. Pusey in his article, which will be read with some astonishment in Germany and France, speaks of phosphorus (it ought to be phosphoric acid), and of ammonia, proves in the most striking manner the injustice of his assertions; for 8 or 10 years ago nothing was known in agriculture of phosphorus or phosphate of lime and nothing of ammonia. It was known, indeed, that bones had a good effect as manure, but no one knew what it was in the bones which really acted. Most agriculturists then believed that the good effects were to be ascribed to the organic matter, the gelatine of the bones; and the detection of this mistake is surely a great gain to agriculture. The nitrogen of plants was not then supposed to be derived from ammonia, but from the nitrogenous constituents of manure; and no intelligent person will deny that the discovery of the true origin of the nitrogen of plants, of its derivation from ammonia, has led to many most profitable applications. The farmer knows how he must proceed, in order to fix this active ingredient in his manure, and at the present time it is the gas works which enable him to fertilise his fields with it. Of all this, eight years before Mr. Pusey wrote, very little was known, and I consider myself therefore justified in declaring that the assertion of Mr. Pusey, "that chemistry, during that long period, has only given to agriculture a recipe for manuring Turnips, and a new manure in Flax water," is erroneous. The recommendation to dissolve bones in sulphuric acid, or to use Flax-water as manure, has, in a scientific sense, no greater value than a useful recipe for good blacking.

With regard to the experiments of Mr. Lawes (the best authority, according to Mr. Pusey), they are entirely devoid of value, as the foundation for general conclusions. With a knowledge of our experience of the effects of fallow, and of production on the large scale, it requires all the courage derived from a want of intimate acquaintance with the subject to assert that certainly ammonia is peculiarly fitted for grain and phosphorus for Turnips, and that the manuring with straw is probably advantageous for Turnips; for, not to speak of individual cases, in which these substances have been found to lead to an increase of produce, we might prove, exactly as Mr. Lawes has done, for a hundred thousand other fields, that these substances do not increase the crop, or even that they do not in any way affect it. At one time precisely similar conclusions were drawn with respect to the effects of gypsum, and of nitrate of soda; and such conclusions, in truth, are only proofs how little those who draw them are acquainted with the principles of agriculture. Everything, in the action of any manure, depends on the composition of the soil to which it is added. To fertilise a soil for grain by means of ammonia alone is like trying to rear an ox with food from which the elements of his bones and blood were excluded.

The opinion that potash, in many cases soda, lime, magnesia, phosphoric acid, sulphuric acid, iron, and (for the cerealia) alkaline silicates, are ingredients of a fertile soil; that these substances, along with certain constituents of the atmosphere, constitute the food of plants, and are as essential to them as bread and meat to men, or hay and Oats to horses;—this opinion is not the expression of a theory, but of a natural law or universal fact. For such persons as understand the scope and bearing of such a law of nature, that indisputable axiom follows as a matter of course, which Mr. Pusey thinks the experiments of Mr. Lawes have annihilated; for it simply coincides with the familiar truth, that a purse of money becomes empty when the money is taken out of it and not returned: or that a man must be reduced to poverty, who consumes his capital instead of the interest.

The problem in agriculture, at the present day, is no longer to ask for proofs of this truth, which no man of science doubts; but the grand object is to substitute for farm-yard manure, that universal food of plants, its elements obtained from other and deeper sources, retaining its full efficacy; and this can only be done when we shall have learned what as yet we know but imperfectly, how to give to an artificial mixture of the individual ingredients the mechanical form and chemical qualities essential to their reception and to their nutritive action on the plant; for without this form they cannot perfectly supply the place of farm-yard manure. All our labours must be devoted to the attainment of this important object.

The negative results of experiments, made without the guidance of just principles, do not gain in value by their multiplication; and millions of them do not outweigh one successful experiment, if the cause of its success be recognised and ascertained. It is perfectly clear that *unexplained* negatived results, or failures, if they are to serve as foundation for an opinion, will yield proofs the more brilliant and striking, the more foolishly and thoughtlessly the experiments have been made: for in this case their irreconcilability with the opinion which they are to refute, is so much the greater. It is certain that the most accurate knowledge of mathematics and of the laws of physics and mechanics does not suffice to render a man an engineer, a machine-maker, or an astronomer; but to conclude from this that an acquaintance with mathematics, with the forces which produce mechanical motion, and with the laws of statics and dynamics is useless for the engineer, the machine-maker, and the astronomer, is as absurd as it would be to say that chemistry is not useful or necessary to the agriculturist. True it is, that chemistry is only then useful, when we have acquired a thorough knowledge of that science, and that it is perfectly useless to those who do not understand it.

Every discovery, every improvement, every new truth in science, as in life, has two ordeals successively to pass through. In the first period of its existence it is proved that the new thing is not true or of no value (let us call to mind the circulation of the blood, gas-light, cow-pox, steam-engines, &c., &c.) After it has fortunately got through this period, it is next proved that the new thing is not new, that it has been long known, that more than a hundred years ago there were people enough who knew it perfectly. It is only in the third period that the new truth bears its fruits. The truth, on which Mr. Lawes has inflicted the death-blow, is yet in its first stage, and my faith in it is such as to lead me to hope that I may be permitted to live to see it in its second and third stages.* It is Providence, of which Sir Robert Peel was only the instrument, which, by the abolition of the Corn-laws, has sent to the agriculturists of England necessity, the mother of invention and of progress, in order to force them to overcome the fear and repugnance they feel towards learning what is new. Let them not, however, deceive themselves by supposing that they can ever attain to real improvements, to real progress, or to the perfecting of agriculture, unless they acquire thorough and accurate knowledge of its principles. If they are not furnished with the capital of science, they will only waste their powers; sooner or later they must see that in this so-called mineral theory, in its development and ultimate perfection, lies the whole future of agriculture.

I know that energetic and vigorous race of men, to which, in its kind, no other can be compared, the English yeomanry, and the wonders which they have accomplished by industry, exertion, and perseverance. When the English farmer has acquired the insight which is still wanting, his iron will, strengthened by his motto, "Through," will conquer all the obstacles which exist between him and the light of science; and when that time comes, Great Britain will cease to import corn. There is no want of land or capital. The agriculturist must no longer calculate on protection; the time is past when the state ought to show or could show him any favour. When the state is shaken to its foundations by internal or external events; when commerce, industry, and all trades shall be at a stand, and perhaps on the brink of ruin; when the property and fortunes of all are

* I do not conceal from myself that the discredit into which the employment of the constituents of the ashes of plants, as manure, may have fallen in England, arises in part from the so-called patent mineral manure. It was the discovery of a new and remarkable compound of carbonate of potash with carbonate of lime, which led, at that time, to the idea of the composition of this manure. And it was on account of this compound, which appeared likely to be of use in other ways, that, according to the custom of England, and by the advice of sagacious men, the manure was patented. The composition of the manure itself could be no secret, since every plant showed by its ashes the due proportion of the constituents essential to its growth. It was a circumstance deeply to be regretted, and the idea which this manure was intended to bring into operation, took the form of a commercial speculation. This, as I know for certain, was not the intention of the excellent persons who manufactured the manure; for in regard to the commercial working of the patent, they did exactly the reverse of what would have been necessary to render it a source of profit. The idea was brought forth prematurely, and, as in the case of a child born before the time, death quickly followed. I have, for three years past, on about 12 English acres of the most barren soil, near Giessen, by the use of a mineral manure, composed on the same principles, obtained, for all the crops which are cultivated in the district, results, which were declared, previous to my experiments, to be impossible, by all the agriculturists who knew the land. For what is called mineral manure, the time will perhaps yet come, when English agriculturists will send ships to Iceland or Sicily to bring from thence, for their corn-fields, cargoes of Palagonite (a mineral, which gelatinises even with acetic acid).

shaken or changed, and the inhabitants of towns look forward with dread and apprehension to the future, then the agriculturist holds in his hand the key to the money chest of the rich, and the savings-box of the poor; for political events have not the slightest influence on the natural law, which forces man to take into his system, daily, a certain number of ounces of carbon and nitrogen. This is protection enough. Whatever else the agriculturist requires, he must find himself. *Professor Liebig's Familiar Letters on Chemistry.* (3d edit.)

## Home Correspondence.

*Drunkenness.*—There are many difficulties in the way of at once putting an end to drunkenness; it must be a work of time. Those who have for years been accustomed to drink deep, whenever an opportunity offered, have created an artificial want, which must either be supplied by another stimulant, or the quantity of fermented liquors gradually diminished. The stomach, from having been continually excited, will have lost its natural tone, and indigestion will result, if left to its own powers, fearfully weakened by indulgence. Let every man enjoy luxuries in moderation as far as his income will allow him, after doing justice to his family. But it is one thing to use, and another to abuse the comforts, within the reach of all, who are careful and industrious. A labourer who has to walk two or three miles to his work, should have something to quench his thirst during the day, besides the water he may procure from the ditch or nearest pump, to moisten the bread he swallows for breakfast and dinner; good tea or coffee, with milk and sugar (cold), are found to be more nutritious and refreshing during hard toil than sour beer or sharp cider; a greater amount of labour will be performed on the former than on the latter, and with less fatigue to the individual. The common style of living in the country, being so much below par, it is not to be wondered at that the labourer cannot resist, during hay-time and harvest, indulging in drink far beyond prudence. In this case the fault lies more with the master than the man. Every species of truck trading should be abolished, each man receiving fair wages at the end of the week, without reduction either for Wheat, Potatoes, or drink. Let him take his cash to the cheapest market, and bargain for himself, without compelling him to purchase at a marked shop. It ought to be well known how the poor man suffers from being obliged to deal with a huckster who will give credit. He and his family must have food; but from the irregular payment of his scanty wages, or from the want of employment, he runs in debt, and is supplied with articles 100 per cent. dearer, and of an inferior description, to those he could procure, if he was a free agent with a few shillings in his pocket. A labourer often gives 5*s.* for tea which could be obtained for 3*s.* per lb. were he at liberty to choose his own tradesman. Other things are proportionably expensive under the compulsory plan of exclusive dealing. Raising the moral character of the peasantry, by attending to their wants and respectability, will redound to the employers' benefit. At present, circumstances rather tend to degrade than elevate the working classes in agricultural districts. Wages are low, occupation uncertain —from the mistaken notion that because produce is cheap labour must be reduced. The contrary is the truth. Cottage accommodation insufficient to preserve common decency in families. No provision made to assist the poor man in procuring the necessaries of life good, and at a moderate price; in fact, in too many instances he is looked upon as a mere machine, from which the greatest amount of profit must be obtained. It is granted, that from long neglect many of the lower orders have become exceedingly unprincipled, will take an unfair advantage of kindness, and disgust those who endeavour to serve them. Although such conduct is unwarrantable, allowance must be made for imperfect education in youth; at the same time a severe check should be put on those who show bad feelings, and the honest man encouraged. Benevolence is often imposed upon. It is a remark amongst labourers, "that the idle live much better upon charity than they who toil hard six days in the week do upon their wages." It must have come under the notice of your readers, how many broad-shouldered fellows lurk about a parish or town, showing themselves in a superior condition to those who "earn their bread by the sweat of their brow." The anomaly should not exist, and indicates neglect and want of management somewhere. It is the duty of every one above want, to take an interest in finding profitable employment for those inclined to work, as well as endeavouring to check the infamous trade of begging, which is one of the feeders of drunkenness. Those who know their situations depend upon sobriety and regular conduct are not so likely to squander away their money in public houses, as those persons who contrive, by ingenuity in making out a hard case, to pick up a few shillings from the tender hearted. There are towns in which, during certain seasons of the year, trampers congregate for the express purpose of plundering the unwary by distressing histories. The orgies of these creatures baffle description; their tables are plentifully supplied with excellent fare, and the nights are spent in drunkenness and profligacy. Will people continue to give at their doors and in the streets, without inquiry, and thus encourage every species of vice? It is in vain to hope for better things whilst such an inconsistency exists. It is a melancholy reflection on this country, to observe the able-bodied young men between the ages of 15 and 30, sauntering about the doors of beer-houses. These bipeds must eat, and how do they procure nutriment? Certainly not by their own labour. They are the leeches sucking the life-blood out of the community. They should be made either to support themselves at home, or be despatched to the colonies, where there is plenty of elbow-room. *Falcon.*

*Cattle Feeding.*—In a late Number you report an interesting experiment by Mr. Brodie, of Abbey Mains, in the various modes of feeding four lots of cattle, which resulted in favour of Turnips and cake. As some apparently important particulars are not mentioned in the process, will you allow me to suggest that the report would, to me, and, I doubt not, to many of your general readers, have been more satisfactory had it stated—that which we are, I think, led to infer—namely, that the original weight of the animals composing the several lots was the same at tying up; and that their original lean cost was included in the stated amount of stones weight to which they were brought. It is not said what quantity of Turnips were consumed by the first and the second lot during seven months; whether any, and what quantity of hay was consumed; nor at what prices such roots were valued per ton in the aggregate of cost. I wish it could have been made to appear that the result had proved of a nature more consolatory to the grazier; but it seems that, while the top price at Smithfield is but 3*s.* 6*d.* per stone (and here about 7*s.* 9*d.* per score only), the lot fed on Turnips and oil-cake cost 3*s.* 9*d.*, while the three others cost respectively, 4*s.* 0½*d.*, 4*s.* 4½*d.*, and 4*s.* 4*d.*; to which would be added, I presume, interest and insurance—driving to market, and salesman's charges. I should hope that the cost, somewhere incidentally alluded to in your Number, of 8*s.* per ton of Turnips, will be found unnecessarily high where the manure is returned by stall-feeding on the roots, &c. It may not be uninteresting to any practical gentleman into whose hands this may fall, to hear the result—which I can myself vouch—of the growth of a measured acre of Yellow Globe Mangold Wurzel, for two consecutive years, on the same ground in this parish. The soil is our general red one; very good, but not particularly rich, nor extravagantly manured with farm-yard dung. The grower's name is Manley. In November, 1848, he harvested 48 tons of roots, and had, besides, 8 tons of tops, not having stripped any leaves in their course of growth. In November, 1849, he harvested 34 tons of roots, and about 8 tons of tops, having, during 10 weeks in August, September, and October, drawn and stripped above ten computed tons of surplus roots (and leaf) for store pigs, in thinning the rows originally sown at 24+13 inches. In 1850 he had 38 bushels of Wheat an acre (by ordinary methods) on the same ground, and from which, having seeded, he is now cutting Clover the second time for soiling. I may mention that the other half of the field (of 2 acres) was sown with the Long Red Mangold Wurzel the first year, and its produce fell short of the yellow by about 10 per cent. *A Constant Reader and Subscriber, Dawlish, Devon.*

*Marking Fowls.*—In your paper of February 22d is a communication from a "Subscriber, Midland Counties," who describes his mode of marking fowls. I abstain from repeating it, to avoid giving publicity to so cruel a practice. The Almighty has made no part of animals without its use to them. *A Member of the Society for Prevention of Cruelty to Animals.*

*Protection.* — It has been argued that agriculture labours under peculiar difficulties, on account of the vicissitude of seasons; but have not the mariner and the merchant similar difficulties to contend with and guard against? and do they not strive to fortify themselves against those casualties to which they, and in a measure, all of us are subject? and should not the farmer do the same? Though dependent upon Providence, we are permitted to a considerable degree to guard against vicissitudes; and while we acknowledge our dependence, it is our duty and our interest to use all practicable means of protection. We have been blessed with a number of fine harvests, more than could have been expected in succession; and without faithless forebodings, we may reasonably expect to be less favoured in this respect; and while we hope for the best, we should provide for the worst. The repeal of the duty on glass enables the agriculturist, as well as others, to apply that light, cheap, and useful article, to various valuable purposes. The Palace of Glass suggests many ideas, such as the roofing of barns, granaries, and drying sheds, with strong plates of coarse glass. I would also suggest the construction of portable protecting sheds for winrows of hay or stooks of corn in the field, or for stacks. These might be made in the form of a long roof with wooden rafters, each two being coupled with a bolt or hinge at top, to open and shut, like a pair of compasses. These rafters should be stayed with cross-bars, bolted or clasped together. They might either be covered with oiled canvas, or grooved and notched for glass, so as to slip in plates, overhanging, and having a ventilating space at the bottom of each plate. Such drying sheds might be made as portable as either hay or corn; and readily set up in a field, adding to or taking from the length at either end, so as to dry first one then another long row of hay or corn, drying and carrying in succession. Long low roofs would be most generally useful, but they might be elevated by means of poles, pulleys, and ropes, or by shanks like the moveable legs of a pair of compasses. Such portable or fixed sheds need not probably be so costly but that one or two wet seasons would repay the expence of them. In addition to these, I would also advise all farmers, without delay, to provide stack staddles of some kind, even if merely of rough wood, though stone, brick, or iron pillars, properly coped, are the most to be preferred. By these, and similar contrivances, and by building the stacks with a hole or two up the middle of each, as far as the casings, hay or corn may be well got in a wet season. I merely throw out these hints for others to improve upon them, hoping that they may be of some service to my poor suffering brother farmers and their implement makers. *O. F.*

*Draining.*—"Inquirer," whose letter addressed to me appeared in the *Agricultural Gazette* of May 31, having in a very friendly spirit sent me his address from Bruges, and given me liberty to reply to it publicly, I trouble you with my answer. "Inquirer" has again put to me several very pertinent questions, to which I wish to reply in the best manner I can; but first I will ask all gentlemen who take an interest in this discussion, to turn to my letter of May 17, which led to it, and likewise to "Inquirer's" reply of May 31, and my answer of June 14. Draining! What sums of money have been worse than uselessly thrown away in land draining! In an age so pre-eminently scientific as our own, how painful it is to hear gentlemen, landlords, and tenants, and many others connected with land, expressing themselves as "Inquirer" has done, in his article above referred to of May 31st; namely, that all that hurts them is the water from the clouds; and all they aim at in the draining of land is to get rid of that water. I have lately made a tour through a part of this county, and on making inquiries as I drove along of farmers and labourers whether they drained their land, and if so, for what purpose; the replies in almost every case were, that they feared nothing, except the "top water," and that all they aimed at in draining their lands was to get rid of that water. Nothing but this could I hear, though I inquired of, I should think, nearly a hundred individuals, and always put the same or similar questions. Permit me, therefore, to reason on this subject with my new friend, who, as I have said, has again asked me several additional questions; but I must, in order to insure a space in the *Agricultural Gazette* for my reply, compress them into the following four, namely—Why do I so strongly recommend deep drains? How deep—or, to use his own words, what is the minimum depth drains ought to be made? With what materials they should be made? and in what shape? My replies to these questions I have no doubt will create as much surprise as my advocacy of rational seeding did some years since; but I entreat "Inquirer" and all others to consider them well, and refute them if he or they should be able. First, then, as I have shown in former articles, in the draining of land my object is just the reverse to what "Inquirer's" is, and, I believe, all others. I drain, not to carry away, but to *prevent* the top water from running *off* my land, and to raise the temperature of the subsoil; and to accomplish these most desirable objects, deep and thorough draining alone will be effectual. But methinks I hear a multitude of tongues all at once asking *if* deep and thorough draining will accomplish these objects? and to them I reply, that it will in all kinds of soils wherever such drains can be made, or wherever the water from them can find outlets. Let "Inquirer" and others expend their money in judiciously making such drains, and then both he and they will not dread but welcome every shower of rain that may fall on their lands and consider rain water to be of more value to them than all the guano in the world could be, highly valuable as that fertiliser always is when properly applied. But "Inquirer" asks how deep such drains ought to be made? I have given a medium depth of 5 feet; but the deeper the drains the higher the temperature of the ground for the roots of the plants to luxuriate in, and the deeper will the roots descend after food and water, and the more certain and yielding will be the crops; nor will he or they require but very little manure or other kinds of dressing except atmospheric air and top water. On this plan I have for the last four years grown 44 bushels per acre on an average on the same land, and from less than two pecks an acre of seed on an average; and for three years in succession grown 48 bushels of Barley per acre on an average, and from less than two pecks of seed per acre; and I should not fear but I could go on in the same way for as many more years, relying more upon atmospheric influence—that is, upon air and rain water—than upon any manures I could use. But "Inquirer" seems surprised at my assertion, that the deepest drains always run first after a long drought, and continue to run the longest after a long continuance of rain; but such are the facts, and in my next letter I will show him the reason why they do; but I must not make my present one too long, or I would indulge him now. I therefore come now to the materials with which the drains should be made. I have no experience in turf drains, and should fear them; but I have known admirable drains made of shingles from the sea-shore, and very rough gravel, or stones picked from the fields; I know drains made 40 years since with such materials, and they now act, I believe, as well as ever they did before. But as pipes and tiles are very cheap, and as they are made upon true principles, they act well, I myself should always use them, unless stones or shingles were close at hand; in all other cases I should use either pipes or tiles. With reference to the size of the pipes, in very small patches of land of about one or two acres, and if the drains are made at very short distances asunder, pipes of one inch bore might be sufficient; but for large fields of from 10 to 20 or 30 or more acres, or for the draining of farms or estates, pipes of various capacities ought to be used, but none of them of less bore than 1½ or 2 inches at the least, and some of them much larger; but on this point also I will write

more at large on some future occasion, when I shall be able, I flatter myself, to satisfactorily demonstrate all that I here assert. But as this question is put to me, and as the capacity of the drains, of whatever material they may be made, is of the utmost importance, I repeat that to accomplish the objects I have in view, namely, to raise the internal temperature of land, and to cause the water from the heavens, which is always charged with ammonia, to permeate through it, and leave its fertilising properties at the roots of the plants, drains (unless in small patches of land or put in very thickly together) should as a minimum quantity always carry at least double as much water as a one-inch pipe can, and in some cases six, eight, or ten times as much, and even more than that. *G. Wilkins.*

*Turnips and Mangold Wurzel.*—On again referring to this subject, I will endeavour to answer some of the objections of "G. S." to the best of my power; premising that he must not be too hard on any slight errors I may have made during my novitiate in farming, which I have only taken to a few years. With regard to the estimate, it was chiefly compiled by the gentlemen I was with, the agent of Mr. Dickinson, late M.P. for that division of Somerset, by whom the estate is highly farmed. I believe the estimate for dibbling will be found correct; but I confess I am not so sure about the drilling, as the latter was never tried; it is, therefore, a *supposed* estimate. Indeed, on reconsidering it, I think I put in too many horses into the bill; and, certainly, the marking out the ground previously with the drill *is* superfluous. I did not mean to say it was necessary. Then we come to the number of acres drilled per diem. This quantity varies in different parts of the country, and depends on how long they are at it each day, and on other causes. Now, in Lincolnshire, where I also passed a term of farm study, they drill from 10 to 12 acres per day: this was on light land on chalk in the Wold district,—and certainly 9 or 10 acres ought to be done, if the drill stays out till 5 or 6; but if it goes in, as they sometimes do, when the ploughs finish, of course less will be performed. With respect to Turnips, I have already acknowledged that April is premature even for Swede sowing. I merely asked the question for experiment sake, thinking that as Mangold Wurzel goes in during that month, Swedes might follow them at the end of the month, and so they would soon after in May. But I also mentioned (which is not noticed), that I considered June to be, after all, as good a time as any, particularly in a dry May, and that June is often a moist month, chiefly in the early part of the month. Lastly, although I do not doubt that drilling Mangold along with manure (like Turnips), might answer, I must defend the system of dibbling, with the seed on the manure. The thing speaks for itself; I have seen the most splendid crops grown under this plan: every year, on the farm I above mentioned, about 40 acres are grown, and if your correspondent "G. S." were to pay a visit to the farm, he would, I have no doubt, see the same this year, and also the same system pursued, explained better than I can do it. With regard to the difficulty of dibbling, &c., surely it does not require any very great capacity for making holes in the earth with a dibble, at regular intervals, especially when done with an improved implement, four feet long, and shod with an iron point. As is remarked, two or three come up in one hole: and so they would in a manner, in drilling, but careful hands are employed to single them, transplanting to any missing hole. Men go first with hoes, and women and girls follow to thin by hand: finally, if necessary, horse hoeing across the ridges is resorted to. There is no more trouble in all this, than if they were drilled like Turnips. I have seen the system pursued for two years: and the roots raised have been so splendid in size, and abundant, that there has been seen no necessity for discontinuing it, in favour of any other. The Mangold (which is the Orange Globe variety), comes in for the stall-fed beasts, of which there are generally from 25 to 30 yearly tied up, of the Hereford breed. They begin with cut Turnips, and steamed hay chaff, sprinkled with meal or oil cake, and towards spring the Mangold comes in as a change. If any are left over, which is generally the case, they are given to the sheep, of which 600 or 700 are yearly fatted (wethers), in fold, on land in preparation for Turnips, for whom it is also cut in troughs. To further advocate the Mangold Wurzel dibbling, I may allude to its being pursued by Mr. Huxtable, I believe, its first inventor, I mean, as to the plan of the seed laid on manure: also to Mr. Mechi's report of its working on the farm of Lord Fortescue, at Castle Hill, by Mr. Graburn, his Lordship's agent, as described in your back numbers. *H. E.*

*Poultry.*—Many of your correspondents seem to be in difficulties about their poultry. From long experience I have found that none of the choice fancy sorts will thrive well in the cold damp districts of the midland counties. I have tried the Dorking, Poland, Topknots, and others, but they became diseased, and did no good. There is a kind of poultry much valued in this neighbourhood, that I do not remember to have seen in London or the south. We call it the Poland Pheasant. They are very handsome, the plumage something like a cock pheasant; the cock is nearly black, with reddish wings, and when well-bred, with a double comb, can scarcely be equalled in beauty; and, in size, not inferior to the Spanish, with good short legs. They are very hardy, and prolific layers. We gathered upwards of 3000 eggs last year, from four or five-and-twenty hens. Allow me to add, for the benefit of poultry fanciers, that fowls will seldom prosper unless they have plenty of liberty, and are allowed to range in the fields. They eat a good deal of green food, the tops of plants, and Grass, which is essential to their health, and which they cannot get in a poultry-yard. Fowls, too, are often killed by too much kindness—particularly by the ladies. One good feed of corn (Barley) a day, is generally sufficient in summer. Perhaps two in winter, night and morning, that is, if they run out. *Clericus Derbiencis.*

*Haymaking.*—Having a small field of 1 acre of mowing Grass, I thought it advisable to make an arrangement with a neighbour to put the produce with his (he having about 5 acres), by which both might be improved by being in a larger bulk. Having the convenience of a weighing machine, I had the curiosity to have mine weighed before taken to the stack; there were 3 waggon loads of it, and the hay weighed 3 tons 7½ cwt.; but what ought I to calculate that would produce of hay when fit for use, say at Christmas. The Grass was cut on Saturday, and carried on Wednesday, consequently in this fine weather it was well made. What I wish to know is—what further loss in weight I may calculate on, or what ought I to charge for it at 3*l.* per ton? *A Young Haymaker.* [Your hay will probably decrease one-fourth part in weight. The Tree Cabbage or Cow Cabbage is sown in February and March, transplanted in May and June, and consumed in autumn.]

*A Word in Season.*—I have been searching in vain in the former number of your Paper for a review of a pamphlet which has just been put into my hands, "A Word in Season." If the statements are to be relied on, and I have no reason to doubt them, it will create a complete revolution in agriculture; but I wish to know what wiser heads than my own think of it. I have given up farming, but keep a few acres for experiments, and would willingly try this. If I have overlooked your critique on the work (which, as it has got to a 7th edition, must have been some time before the public), I shall be obliged by your directing me to the number in which it appears; if not, perhaps you will favour us with your opinion. *R. N.* [The work and its doctrines have been the subject of ample discussion in past numbers of this year's volume.]

*The Acre.*—This question appears to be still open to a further reply. Here, in Cornwall, the customary acre exceeds the statute acre by having 18 feet in the side on the square rod, pole, or perch, while the statute acre has but 16½; therefore, the area of the Cornish acre is to the statute acre as 324 is to 272.25, or, in round numbers, as 100 is to 84—very nearly. *W. E. Gill, Truro, June 3.*

## Societies.

BELFAST SOCIETY FOR THE PROMOTION OF THE GROWTH OF FLAX IN IRELAND, *June* 25.—The growing Flax crop was reported to look generally well, though in some districts it appeared rather short, and had, in a few instances, been attacked by the Flax-flea; but the late showery weather had greatly improved the crop, and it promised well. A return of the quantity of sowing Flax seed imported from Russia, Holland, Prussia, America, and England, into Ireland, for the season just terminated, had been received, and a rough estimate made of the amount actually sown, after adding the probable quantity of home-saved seed employed, and deducting what had been left unsold. From this calculation it appeared that the sowing of Flax in the present year amounts to about 119,454 statute acres, which should yield nearly 30,000 tons of fibre. Comparing this with previous years, it appeared that the sowing was, in 1847, 58,312 acres; 1848, 53,863; 1849, 60,314; 1850, 70,000; 1851, 119,454. The quantity sown in the present year was, therefore, about double the average of the previous four years. The largest quantity sown in Ireland, in any year, was in 1844, when it was estimated that there were 122,688 acres under Flax; so that the breadth grown this year is within a fraction of the largest previous culture. The attention of the meeting being drawn to the circumstance that specimens of Flax and of manufactures, ticketed "Golden Flax," had been placed among the samples of fibre exhibited by the Royal Flax Society in London, it was resolved that the parties who had done so should be required to remove the articles, and that a notice should be placed on the spot to the effect that they had been deposited without the committee's knowledge, the society not sanctioning the use of its name in connection with substances termed "Golden Flax," as there is no such variety of the Flax plant, and having previously disavowed its sanction of such advertisements. A stone of Flax fibre, steeped on Schenck's system, by Mr. Allen, Latimerston, County Wexford, was shown to the meeting. It was of great strength, and valued at 52*l.* per ton.

## Farmers' Clubs.

PROBUS: Mr. W. TRETHEWY, of Treegoose, on "*The utility of an early crop of Rape, and the best means of obtaining it,*" showed the present method of cultivation in his district.

The method adopted a few years since, he said, for preparing the land for this root was to skim, burn, and plough down the ashes, or plough to rot, &c., but it was now found that a single ploughing with the skim coulter, with the aid of artificial manures, is not only a more certain means and less expensive; but, in addition to these two advantages, the land may be pastured to the very day of ploughing and tilling. If the weather prove favourable, in a few weeks the Rape may be stocked with fattening sheep, either draft ewes or wethers: whilst the lambs may be put in such pastures as are best adapted for bringing them forward. I can speak, he said, from experience that, the better lambs are kept the less danger attends them, and therefore the early crop of Rape gives food to the draft ewes or wethers (if not gone before), and the lambs have a better herbage. I wish you to understand, that I do not recommend lambs to be kept on Rape, unless they are intended to be immediately slaughtered. From late Rape I have rarely seen much benefit, the weather being often wet, &c., and sheep feed more plentiful, in addition to which the markets are usually better supplied with mutton. Rape does well for spring feed, particularly if tilled in a sheltered situation; it renders, perhaps, a greater quantity of food per acre than may be calculated on, for it sprouts very quickly in the spring, if not eaten too close during the autumn, and if continued to be stocked on during the summer the land can be again sown with Rape, Turnips, or Vetches. Wheat stubbles, after an early harvest, may be tilled to Rape with great advantage. I would recommend sowing Rape as early as possible in the spring, drilling it 15 or 18 inches apart, horse-hoeing, and, if necessary, hand-hoeing also. A very useful implement for preparing the land for this as well as other crops is the shaver; its capabilities, I have no doubt, you all know. With guano, superphosphate, &c., Rape may be grown after Turnips, Wheat, Barley, Oats, Grass, or almost any crop. I have frequently seen Mustard sown with Rape, which I have heard proves a good mixture. I would add, by way of conclusion, that it would very much tend to improve the following crops, irrespective of the benefit to the sheep, if, when folded on Rape, they were given a small portion of oil-cake daily, say half-a-pound each. I would not advise confining them on Rape, but would recommend their having a Grass field to run in at times, if convenient. Bullocks and pigs also do well on Rape. There is also another advantage to be derived from Rape, when you have more than your own stock will consume, and when stock is dear, viz., in ploughing it in, which Mr. Nesbit says will improve the land, if heavy, more than feeding it off; and in the *Mark Lane Express*, of 30th September last, you may find his statement confirmed by many practical farmers; and experience has proved it to be one of the best preparations for a Wheat crop. In the discussion which ensued, some useful points were elicited. Three successive sowings of Rape were advocated—the first in the commencement of May, or even the latter week in April, if the weather proved favourable, and the soil congenial; and the two next sowings should take place at intervals of a month or five weeks from each other. The English Dwarf Rape was recommended for sowing. This variety having small roots could be grown on land of inferior quality to what was necessary for the common sorts, while it produced a broad leaf and ripened earlier. The drilling of Rape in preference to broad casting was strongly recommended. Some of the members stated it could be grown a week to 10 days' earlier, besides producing a much heavier crop.

## Miscellaneous.

*Cost of Cultivation.*—The different items which make up the costs of cultivation are found to vary considerably, influenced partly by the nature of the soil and climate, partly by the system of husbandry pursued, and chiefly by the greater or less command of capital and energy possessed by the cultivator. It is difficult to ascertain with precision the amount of these costs, and any reliable facts on this point are, therefore, the more valuable. We have been favoured with such information as has enabled us to compile the following table, showing the sums which make up the cost of cultivation, with the yield of corn per acre, in the undermentioned districts:

| Howdenshire Farm, East Riding—strong clay, 140 acres arable, 25 acres Grass | Holderness — fertile clay on red clay subsoil, 230 acres all arable | Holderness—98 acres arable, 17 acres Grass | Yorkshire Wolds—230 acres arable, 46 acres Grass | Yorkshire Wolds—400 acres all arable | Lincolnshire Wolds — 1017 acres arable, 500 acres Grass | Lincolnshire Wolds — 524 acres arable, 130 acres Grass | Warp Land Potato Farm—400 acres arable |
|---|---|---|---|---|---|---|---|
| Rent. s. d. | 13 9 | 27 0 | 29 0 | 29 6 | 25 0 | 35 0 | 21 4 | 20 0 |
| Tithe. s. d. | 3 2 | Free. | 1 0 | Free. | Free. | 2 8 | Free. | Free. |
| Public & Local Taxes. s. d. | 2 4 | 3 9 | 4 8 | 5 3 | 1 11 | 5 3 | 2 3 | 4 6 |
| Manual Labour. s. d. | 24 2 | 27 2 | 26 4 | 22 5 | 37 4 | 29 0 | 25 2 | 32 6 |
| Horse Keep. s. d. | 10 5 | 9 2 | 12 0 | 8 5 | 11 7 | 11 2 | 10 6 | 13 10 |
| Tradesmen's Bills. s. d. | 5 8 | 2 2 | 5 0 | 4 5 | 7 0 | 4 7 | 6 9 | 4 0 |
| Manure Purchased. s. d. | 5 6 | 1 8 | 4 5 | 4 9 | 4 11 | 8 6 | 3 9 | 10 0 |
| Cake, &c. Purchased. s. d. | 1 9 | 6 8 | 5 5 | 3 4 | 5 6 | 11 0 | 7 6 | 10 0 |
| Total per acre. s. d. | 66 9 | 78 2 | 80 0 | 78 1 | 105 0 | 84 6 | 77 3 | 104 10 |
| Yield per acre in bushels. Wheat. | 20 | 32 | 35 | 26 | 35 | 32 | 20 | 33 |
| Oats. | 28 | 48 | 55 | 48 | 64 | 48 | 56 | 64 |
| Barley. | 24 | — | — | 32 | 44 | 36 | Six tons Potatoes; previous to 1847, 10 tons per acre. | 36 |
| Beans. | — | 20 | 10 | 20 | — | 28 | — | — |
| Proportion in bare fallow. | 1-6th | 1-5th | none. | none. | none. | none. | none. | — |

The column of "total cost" does not include interest of capital, depreciation, insurance, or tenant's profit; and under the head "yield" is only included the corn, as we had no sufficient *data* for comparison and future reference, by which they may test their own expenses and produce, and ascertain in what respects they excel or fall short of the examples here given. It is proper

to explain that the three first columns are averaged on the whole extent of each farm, arable and Grass; while the rest are charged on the extent of arable land only. This is not strictly correct, but it appeared the fairest criterion we could adopt, as the comparative extent of Grass land on each farm was so exceedingly variable. The figures may be relied on as a statement of facts as they exist—not estimates of what might be, but what they at this moment are. *Times Commissioner; Northallerton, Yorkshire, Nov.* 1850.

*Draining by Machinery.*—A series of interesting experiments have been lately made at the farm of Mr. Ruck, Down Ampney, Gloucestershire, for the purpose of proving the superior advantages of draining land by machinery, both in time and expense, as compared with manual labour. The machine is an invention of Mr. Fowler, of the firm of Fowler and Fry, of Bristol. The field selected for the experiments consisted of stiff clay land, exceedingly dry on the surface, and crossed by a gravel path. The machine is formed by two horizontal iron frames, 9 feet long, placed 2 feet apart, supported at one end by three wooden rollers, of 1 foot diameter, turning on axles; at the other end by two cart wheels. At the end nearest the cart wheels, and between the two frames, is supported a perpendicular plough or coulter of iron, 7 feet in height, 9 inches broad, and three-quarters of an inch thick; the side of this plough or coulter, intended to cut the drain, has a sharpened edge, the other side is formed into a rack, which can be raised or depressed at pleasure, by a pinion or winch working into it, so that the plough is capable of being placed in the ground at any required depth. At the bottom of this upright plough or coulter is a socket, in which is placed a lengthened horizontal cone or plug, the point or apex in the same direction as the sharp edge of the coulter; at the back of this plug is fixed a rope, upon which is strung as many drain pipes as its length will allow; a simple process is adopted to add fresh coils of rope, as more pipes are required. A hole is then dug in the ground, say 2 feet deep, and a foot wide, as in the present experiment, gradually sloped at the back, so as to allow the rope with the pipes to enter freely, and the coulter is placed upright in the hole, with its sharp edge and the point of the plug in the direction the drain is to be formed; at the end of the horizontal iron framing, farthest from the coulter, is fixed a horizontal pulley, through which a wire rope is passed, fastened at the other end to a capstan placed at the opposite extremity of the field, up to which the drain is to be formed. Four horses were harnessed to the capstan, which they turned with very trifling exertion, thus drawing the coulter through the land, the plug forming the drain and the rope with the pipes following. The time occupied in laying the nine chains of piping was 33 minutes, and the surface land was not more disturbed that if a knife had been drawn through it; when the coulter was drawn up to the capstan it was raised out of the ground, the rope disengaged from the plug, and the horses hitched to the other ends of the coils of ropes, which they immediately drew out, leaving the tiles accurately placed, as was ascertained by digging down to the drain. Another drain was then immediately formed in the same manner, at a parallel distance of about 15 feet, the capstan in the same position. The estimated expense of draining land in this manner, independent of the cost of the tiles, is about 4*d.* a chain. From 6000 to 7000 feet can be drained in one day, at an expense of about 30*s. Architect, June* 14.

*Gypsum.*—The Belgian Government, having established depots in different places throughout Luxemburg and Namur, for supplying lime to the farmers of those districts, in which it had been very difficult for them to obtain that earth, for the improvement of their land, have, by a further measure, ordered the establishment of depots of gypsum in different parts of Flanders for the same purpose, a substance which, although most cheap and abundant in France, is not found naturally in Belgium, at least not, as we know, in any working quantities. Although the utility of gypsum in agriculture is no longer questioned, we avail ourselves of this opportunity of stating the principal advantages to be derived from its agricultural application. It has especially the property of stimulating the growth of leguminous forage plants, particularly of the Pea, Vetch, Bean, Lucerne, Sainfoin, Clover, Lupine, and Lupuline or Golden Minette. Among these plants, Sainfoin, Clover, and Lupine are those of which the products are most obviously increased by means of gypsum. It is well known that Franklin, in order to demonstrate this effect to his countrymen, the Americans, in a striking manner, in reference to Clover, spread gypsum on a Clover field, near a public road, in such a manner as to form, in gigantic letters, the words, "This Clover has been gypsumed." As the crop came up the superior growth and deeper green of the plants constituting these words, thus traced by the gypsum, rendered the characters more visible; and the demonstration was considered so satisfactory as to put an end to all the arguments that had been adduced against its application in the case of Clover. Lupine, which has been recommended as a green crop for ploughing-in on poor lands not easy otherwise to manure, assumes so great a development, when aided by a little gypsum, as to give to the soil into which it is introduced while in flower, a manure occasioning it to bear abundant crops. When mixed only in small proportions with liquid or solid manuring matter, it has the property of absorbing from them the ammoniacal gas which constitutes so great a part of their fertilising power. The means thus placed by the Belgian Government within the reach of the farmers of that country for obtaining a cheap and abundant supply of this substance, will enable them to verify its advantages by direct experience, and to give a new extension to the cultivation of the most nutritious forage plants, which will thus increase in a large proportion the number of cattle, the amount of manure, and consequently that of all the products of agriculture. *From the French of the Revue Villagoise.*

## Calendar of Operations.

JULY.

LAMMERMOIR SHEEP FARM, *July* 1.—In our last communication, dated about the 1st of June, we stated that the weather was ungenial and vegetation considerably retarded. Although the same state of things continued during the greater part of last month, matters have been greatly changed for a week past, when, instead of very little sunshine, we have had an unclouded sky, and the thermometer at 78° in the shade at noon, instead of 55°. We need scarcely add that the face of the country is greatly altered, and that there is now abundance of Grass. During June, the care of the shepherds has not been directed to any one particular work, but to the general comfort of their flocks. On flat rough grounds especially, where sheep are most apt to get "awkward," their constant attendance is required to keep them from rolling. Indeed, from 3 in the morning until after 9 at night they must be on the look-out, and even with all this care, sheep are occasionally lost. Sheep-shearing is generally over in the district, although we do not begin ourselves until the 3d. The half of the stock were washed yesterday, and we expect to finish to-morrow. The universal custom on the Border hill farms is to swim, instead of hand-wash, the sheep, as practised in Lowland districts. A natural or artificial pool, 4 or 5 feet deep, and from 15 to 20 yards broad, having a "jump," or bank, about 3 feet high on the one side, and a gradual slope on the opposite, is selected in some convenient place. Through this the sheep are made to swim some three or four times, after which the wool will be found as white and clean as that which has been hand-washed. There is also much less fatigue to man and beast, while ten times the number can be got through with the same hands. Especially during hot weather like the present, the washing should be performed early in the morning, or towards evening, both because it is less fatiguing to the sheep, and because they are more easily collected before they have left their "lairs" on the morning, or when they are returning to them about sunset. The shearing is seldom all performed by the shepherds on the farm. The day having been fixed, and it being desirable to have a certain number of sheep finished on the same day, notice is given to the neighbours that so many hands will be required. In this way a dozen or more shepherds are assembled; but we know some who prefer hiring their hands, and the plan has certainly its advantages, but we do not think they are great, and like to keep by the patriarchal fashion, which, moreover, tends to foster a spirit of good neighbourhood both among masters and men. We finished Turnip sowing on the 21st ult., and have begun to thin this day. Until within the last week, the plants have been growing very slowly, but are now pushing away vigorously. Thinning, horse and hand hoeing this crop, will furnish abundant work on the arable portion of the farm all July. *A Lammermuir Farmer.*

## Notices to Correspondents.

FELT: *J W H.* It requires dressing every year, and will then last long.

LAURELS, &c.: *J O P.* We are not aware that the eating of these plants will produce the effects complained of. *W C S.*

THE EXHIBITION: *X.* We shall be doing a service to working men from the country, who may be in town for a few days, and to all others who wish to unite economy with comfort and cleanliness, by recommending to them the Model Lodging-house, or Metropolitan Chambers, Albert-street, Buxton-street, Mile End New Town.

## Markets.

COVENT GARDEN, JULY 12.

Trade is good, and the market is well supplied with all kinds of Fruit and Vegetables in season. Peaches and Nectarines continue to be sent in large quantities. English Pines and Hothouse Grapes are plentiful, and the former cheaper. Strawberries are now in good demand, and the supply is abundant. Cherries are furnished in large quantities, and they are excellent in quality. West Indian Pines fetch from 2s. to 5s. each. Oranges and Lemons are sufficient for the demand. Nuts remain nearly the same as quoted last week. Asparagus, Carrots, French Beans from the open ground, and Green Peas are received in quantity. New Potatoes may be obtained at 1d. to 4d. per lb. Lettuces and other salading are sufficient for the demand. Mushrooms are a trifle dearer. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis floribunda, Pinks, Moss and Provins Roses.

FRUIT.

HOPS.—FRIDAY, July 11.

Messrs. Pattenden and Smith report that the market continues firm at late quotations. The accounts from the plantations are still of an unfavourable character, speaking of lice and honey dew in abundance. The duty is estimated at 100,000*l.*

COAL MARKET.—FRIDAY, July 11.

Carr's Hartley, 13s.; Eden Main, 13s. 3d.; Wallsend Hetton, 14s. 6d.; Wallsend Lambton, 14s.; Wallsend Stewarts, 14s. 6d.; Wallsend Tees, 14s. 3d.—Ships at market, 86.

SMITHFIELD, MONDAY, July 7.

There was a larger supply of Beasts, but the dead markets being clear there was a demand for choice ones not too big; these readily made 8s. 6d., and in a few instances rather more. Heavy cattle were with difficulty disposed of at late rates. The number of Sheep and Lambs was larger, however; the demand has increased for sizeable ones, and rather better prices were obtained, but fat Sheep were not dearer. Good Calves meet with a steady sale. From Holland and Germany there are 342 Beasts, 2250 Sheep, 174 Calves, and 70 Pigs; from Scotland, 70 Beasts; and 70 from France.

| Per st. of 8 lbs.— | s | d | s | d | Per st. of 8 lbs.— | s | d | s | d |

Beasts, 3651; Sheep and Lambs, 33,230; Calves, 345; Pigs, 390.

FRIDAY, July 11.

The supply of Beasts is larger than the demand; consequently the best kinds with difficulty reach Monday's quotations, and many second-rate remain unsold. There is also a considerable number of Sheep and Lambs; trade is slow for the former at lower prices, but for the latter late rates are fully maintained. Calves are very plentiful; the choicest make nearly as much as on Monday, but inferior are unsaleable. From Germany and Holland we have 326 Beasts, 990 Sheep, and 167 Calves; from Scotland, 80 Beasts; from Norfolk and Suffolk, 300; from Leicester and Northampton, 100; and 98 milch cows from the home counties.

| Best Scots, Here-fords, &c. | 3 | 4 to 3 | 6 | Best Long-wools . | 3 | 4 — 3 | 6 |

Beasts, 963; Sheep and Lambs, 15,880; Calves, 714; Pigs, 385.

MARK LANE.

MONDAY, JULY 7.—The supply of Wheat from Essex to this morning's market did not exceed 500 qrs., that from Kent was moderate; the greater part was disposed of on about the terms of Friday last, being a decline of fully 3s. from the highest point. Finest qualities of foreign must be quoted 2s., and inferior 2s. to 3s. per qr. lower than this day fortnight, with a very limited demand.—The value of Barley is unaltered.—Beans and Peas are a dull sale.—Oats must be written 1s. per qr. cheaper.—The demand for Flour is very small at our quotations.

FRIDAY, JULY 11.—The arrivals of English corn this week have been small, but of foreign considerable.—In the value of English Wheat we observe no alteration from Monday, and towards the close of the market we experienced more inquiry for foreign, but without leading to business, excepting where holders to clear vessels were induced to accept some abatement in price.—Barley is firm at former rates.—Beans and Peas are a dull sale.—Oats are difficult of disposal at a decline of 1s. per qr.—Holders of sack Flour insist on late prices, but barrels are obtainable at a slight reduction. A few cargoes of Galatz Maize on the coast have changed hands during the week at 27s. to 27s. 6d. per qr. In the floating cargoes of Wheat there is nothing passing. Polish Odessa is nominally worth 35s. to 36s. per qr.

LIVERPOOL, TUESDAY, JULY 8.—At this day's market there was a good attendance of the town and country trade, who evinced more disposition to make purchases. Wheat and Flour met with a slight advance. Oats and Oatmeal were difficult to dispose of, and 3d. per 45 lbs. and 6d. per load lower. Barley, Beans, and Peas were in moderate request, at late rates. Indian Corn attracted little attention, though prime yellow American was offered at 28s. per qr. from the quay, being a reduction of fully 2s. per qr.—FRIDAY, JULY 4.—We have had another week of brilliant weather. The growing crops of grain, but more particularly of Wheat, have everywhere greatly improved. The sharp fall in the price of Wheat and Flour on Tuesday has brought forward some parties willing to invest, and a few parcels of American Flour have changed hands at fully 6d. per barrel on Tuesday's low rates. With the small business done in Wheat and Flour at our market this morning, it is scarcely worth while to quote any advance in prices, but there was evidently a better feeling towards the trade than on Tuesday, and purchases could not be made at the low rates of that day. Indian Corn was in slow request for Ireland, and it was offering at 6d. to 1s. per qr. reduction. The American best yellow corn was not worth over 28s. 6d. per 480 lbs. Oats, Barley, Beans, and Peas stand as quoted on Tuesday.

*Just published, considerably enlarged, price 5s. 6d., the Third Edition of*

# RURAL CHEMISTRY:

AN ELEMENTARY INTRODUCTION TO THE STUDY OF THE SCIENCE IN ITS RELATION TO AGRICULTURE.

BY EDWARD SOLLY, F.R.S, F.L.S., F.G.S.,

Honorary Member of the Royal Agricultural Society of England, Professor of Chemistry to the Horticultural Society of London, Lecturer on Chemistry in the Honourable East India Company's Military Seminary at Addiscombe, &c., &c.

PREFACE TO THE THIRD EDITION.

"In accordance with numerous suggestions, very considerable additions have been made to this little book, in preparing it for a new edition; several important practical matters, not treated of in any former editions, having been introduced. Brief descriptions of the more important of the domestic arts, such as Wine and Vinegar Making, Brewing, the Manufacture of Spirits, Baking, Cheese-making, Cookery, &c, have been added, together with some account of the Scientific Principles involved in those arts. Numerous recent analyses of agricultural crops have likewise been given, and the whole has been carefully revised and corrected."
